they are chiefly sent for sale to Artois, Flanders, and Paris. The herring fishery of Boulogne had attained great importance so far back as the year 1542, and was patronised by the principal men in the kingdom, as appears from an ancient record preserved by the treasurer of the city, who made his escape when the place was taken by the English in 1544; and, to this day, it retains so much of this celebrity, that fish from other places are very generally exposed to sale in Paris under the name of Boulogne herring. A few woollen and linen stuffs are manufactured at Boulogne; and it used to import salt hides from Ireland, with white wines, brandy, and salt, from French ports, for the consumption of the neighbourhood. But the chief gains of its merchants arise from the exportation of Bourdeaux, Burgundy, and Champagne wines, and the smuggling of brandies and cambrics to England. Besides two market days every week, there is a free market on the first Wednesday of every month, and a fair every year on the 11th of November, which continues nine free days; and which is chiefly remarkable for its great show of cattle. Boulogne contains about 10,000 inhabitants; and is seven leagues south-south east from Calais, 22 west of Lisle, and 55 north east of Paris. At spring tides, it is high water at 10 hours and 30 minutes. N. Lat. 50° 43' 35", E. Long. 1° 36' 33". (7)

BOULTER, HUGH, D. D. Archbishop of Armagh, and primate of Ireland, was born in or near London, of respectable and wealthy parents, on the 4th of January 1671. He received the rudiments of his education at merchant-tailors' school; and was admitted a commoner in Christ-Church, Oxford, some time before the revolution. Soon after that event, he was, on account of his great merit, elected a Demi of Magdalen-College, along with Mr Addison and Doctor Joseph Wilcox. He was afterwards made fellow of the same college. He remained in the university till the year 1700, when he was called to London by Sir Charles Hodges, principal secretary of state, who made him his chaplain. Not long after, he was preferred to the same honour by Dr Denison, Archbishop of Canterbury. While in these situations, he had occasion to appear often at court. There his merits attracted the notice, and procured him the patronage, of the Earl of Sunderland, principal Secretary of State, by whose influence he was promoted to the parsonage of St Olave in Southwark, and to the archdeaconry of Surrey. As pastor of St Olave, he distinguished himself by his unremitting attention to the temporal comfort and spiritual welfare of the people over whom he was set. In 1719, he went to Hanover with George I., in the capacity of his chaplain: and at the king's desire, undertook to instruct young prince Frederic in the English tongue. His majesty was so much pleased with his temper and conduct, that he promoted him to the bishopric of Bristol, and deanry of Christ-church, Oxford, which had become vacant by the death of Dr Smalridge. As a bishop, he was extremely zealous in promoting the interests of religion throughout his diocese; and this he did, particularly, by enforcing on the clergy the necessity of personal respectability, and of a faithful discharge of their peculiar duties. In 1724, he was nominated by the king to the archbishopric of

Armagh, and primacy of Ireland. This nomination, of which most men would, on many accounts, have accepted with the utmost readiness, Dr Boulter begged leave to decline: and it was only in consequence of the absolute command of his majesty, and not without great reluctance, that he at length agreed to leave his present situation, for one so much superior to it in dignity and importance. The king and his minister urged the promotion, not only in consideration of Dr Boulter's general merits, and peculiar qualifications for the spiritual jurisdiction to which he was appointed, but also because at that time, in consequence of Wood's coinage of base copper, Ireland was in an alarming state of ferment and agitation, which they hoped to remedy by the sound judgment, and firm yet conciliating temper of the bishop. And he did not disappoint the expectations of his royal patron. As soon as he was formally introduced into his new office, he began to study the prosperity of Ireland, which he thenceforth called his country; and to this end devoted a great proportion of his time and fortune. His life, indeed, was almost solely spent in deeds of public usefulness and private charity. To do good, as he had opportunity, was his business and his pleasure. Whatever plan was deemed useful to promote the commercial prosperity, the religious instruction, the domestic happiness, or the individual comfort of the Irish, found in him a steady and efficient friend. More than once, he was instrumental, by his activity and munificence, in averting the evils of famine and pestilence, with which the country was threatened. To the scheme for a canal from Lough-Neagh to Newry, by which the whole kingdom, especially the northern division of it, was to be greatly benefited, he gave not only his best counsel, but considerable sums of money and contributions of timber. The poor clergy of his diocese frequently experienced his kindness, by having their children educated at school and the university at his individual expense. For clergymen's widows, too, he erected four houses at Drogheda, endowed them suitably, and put them under proper and judicious regulations. The same thing he directed by his will to be done at Armagh. He expended 30,000*l.* in augmenting small livings, and buying glebes in Ireland, besides what he bequeathed for similar purposes in England. He was a zealous and active member of the *Incorporated Society in Dublin for promoting English Protestant Schools in Ireland*, the benevolent object of which he forwarded by annual subscription, occasional benefactions, and every means in his power. His private charities, from the secret and unostentatious manner in which they were conducted, cannot be easily ascertained; but from the information of those who had access to know, it is certain that they were uncommonly great, and quite worthy of his humane and liberal mind. The archbishop took a considerable part in the political government of the country. When health permitted, he gave regular attendance at the council board, and contributed his full share in giving dignity to their debates, and wisdom to their decisions. He was particularly active in supporting and carrying into effect a measure for reducing the value of the gold coin, for the purpose of putting a stop to the injurious practice of sending silver abroad.

This measure excited against him a great deal of popular odium, and made Dean Swift his inveterate enemy. But he had fortitude enough to despise the clamours of the multitude, and the enmity of the Dean: and experience soon demonstrated, that his knowledge of political œconomy, and of the best interests of the country, was, in this matter, far superior to theirs. Perhaps the opposition which he met with in his efforts to regulate the coinage, was owing, in a great degree, to his well known preference of what was called the English to the Irish interest. Such a preference he did in fact aver, in so far as he always recommended persons from England to the places of chief trust and authority. But he acted thus from no selfish views or national partialities, but from a firm conviction that the welfare of Ireland, and the king's service, were thereby most effectually promoted. His wisdom in this proceeding may be fairly questioned. But the uprightness and integrity of his motives can be doubted by nobody who is acquainted with his character. To the prosperity of the church, and the security of the protestant religion, he was remarkably attentive; and took an active part in framing and passing the bills which parliament enacted at that period, with reference to these important objects. He seems to have enjoyed, above most statesmen of his day, the confidence of the government; and the confidence which he acquired by his well known judgment and talents, he continued to retain to the end of life, by the prudence and moderation that he displayed, with regard to every scheme on the adoption of which he was consulted, or in the execution of which he was employed. As a proof of the estimation in which he was then held, it may be mentioned, that he was no fewer than thirteen times one of the Lords Justices, or Chief Governors of Ireland. He set out for England on the 2d of June 1742; and, after an illness of two days, died at his house in St James's, on the 27th of September following. He was buried in Westminster Abbey, where a stately monument has been erected to his memory. The temper of Primate Boulter was remarkably meek and pleasant. His aspect was venerable, and his demeanour grave and sedate. To the rich he was affable, and to the poor kind and condescending. To the principles of civil and religious liberty he was firmly attached. He was well known to possess a great deal of learning: but as his life was almost wholly spent in action, he has scarcely left any memorials of it behind him. He wrote and published some *Charges* to the clergy of his diocese, which are judicious and instructive. It may be easily supposed, that his political correspondence, while he had so much to do in the government of Ireland, would be extensive and interesting. Fortunately it has been preserved. It was published in 1769, at Oxford, in two volumes 8vo, with this title, *Letters written by his Excellency Hugh Boulter, D. D. Lord Primate of all Ireland, &c. to several Ministers of State in England, and some others, &c.* These letters deserve a careful perusal from all those who wish to be particularly acquainted either with the real character of Dr Boulter himself, or with the history of the Irish government during the period in which he flourished. See *Biog. Bri.* (r)

BOUNTY, signifies a pecuniary gratification paid from the public revenue of a state, for the encouragement of navigation and shipping; or of some particular branch of agriculture, trade, or manufacture.

Bounties may be divided into two sorts; as they relate to the defence, and as they relate to the commercial prosperity, of a state. The first may be called their *political*, in contradistinction to the second, their *commercial* object. A bounty of the former description may be politically right, while it is commercially wrong. A bounty of the latter description can never be right, either in the one way or the other.

First, From the insular situation of Great Britain, the bounties which relate to the defence of the state, are chiefly those given for the direct and avowed purpose of encouraging its navigation and shipping. Bounties of this description seem, on the whole, expedient. It is certain, that, like all other bounties, their effect is to force a greater proportion of the general capital into that sort of employment than would otherwise go into it, and thus to stunt other occupations of the capital, which would naturally tend thither without any national premium. In a commercial point of view, therefore, bounties of this nature produce a double disadvantage. They produce a negative disadvantage, by drawing capital from its natural, and therefore productive, employment, to one that is losing; and they occasion a positive disadvantage, in the tax which must be raised upon the people to defray the bounties themselves. The principle of this description of bounties, however, is still *politically* good. The defence of the country depends mainly on its maritime force. The superabundant capital invested in navigation and shipping, by the encouragement of the bounties, necessarily implies a certain correspondent superabundance of seafaring men. But it is chiefly in this school of hardiness, dexterity, and maritime attachment, that the national security is raised, cherished, and preserved. To accomplish, therefore, this essential object, or at least to render it as much as possible independent of the power of accident, must be a political good, greatly counterbalancing the commercial disadvantages to which we have alluded.

The bounties given directly and avowedly for the purpose of augmenting the navigation and shipping of the country, are principally the tonnage bounty on the white herring, and that on the whale fishery. The injudicious manner in which these bounties, particularly the former, have been granted, as well as their unnecessary extent, has been clearly pointed out by intelligent œconomists. It has been thought that the commercial disadvantages attending every species of bounty, if not prevented, might at least have been palliated. To connect with the tonnage bounty upon the white-herring fishery, a bounty upon the herrings exported, was the direct way to raise the price in the home market, and thus, by a very plain operation, to embarrass the poorer sort of people with an increased price, more or less, for all the necessaries of life. Nor was a high rate of the tonnage bounty necessary. It could only bribe the indolence of the fishers, and, as has been smartly said, make them more intent on catching the bounty than the fish.

Second, The other, and by far the greater class of bounties, comprehends those which relate more directly to the commercial prosperity of a state. These, therefore, have, or profess to have, for their object, the encouragement of some particular branch of agriculture, trade, or manufacture. For this purpose, direct bounties upon production have seldom been resorted to by the British legislature. Those upon *exportation* have been the favourite, and almost exclusive mode.

Among custom-house people, the term, as connected with exportation, and as we are now using it, is frequently confounded with that of *drawback*. According to them, every payment made by the government to the exporter of a commodity which has undergone any change since its importation, is *bounty*, although it should, in fact, be only a return of the duty formerly advanced upon it, when under another shape. Thus, what is called a bounty upon the exportation of wrought silk, is, in truth, nothing else than a return or drawback of the duties upon raw silk imported. The term *drawback* they confine to the return of duties upon those commodities which remain the same as when imported. The two things, however, are in their nature clearly distinct. Nor in our reasonings upon them, is there any difficulty in preventing this impropriety in the use of the terms from affecting the accuracy of our conclusions. Bounty upon exportation, denotes a clear advance from the public treasury, without reference to any import duties formerly exacted upon the commodity itself, or the raw material of which it is composed. In the loose sense of the custom-house, it can frequently be the subject of little approbation or censure. In that sense, it often implies nothing else than a refunding, more or less, of a duty formerly exacted, and therefore so far only tends to restore things to their former equilibrium. In the sense, however, in which the term is properly used, a bounty upon exportation must produce some positive effect, either good or evil.

Bounties of this sort form one of the great expedients by which the Mercantile System undertakes to enrich the country. While by heavy duties, says this system, you restrain the importation of foreign commodities, and encourage by liberal bounties the exportation of your own, the balance of trade with every other state must necessarily be in your favour. This balance must as necessarily be paid in gold and silver; and as these metals form the only species of riches worth the coveting, the nation must inevitably grow rich. It is long since the foundations of this system were demonstrated to be in error; but the fabric itself is, to this hour, incessantly propped by the busy and eager hands of a vigilant self-interest. None but persons of obtuse intellect are, now-a-days, blind to the absurdity of its principles; whilst its pernicious operation is still permitted to gratify a mercantile and manufacturing avarice, at the expense of the general community. Who now maintains the exploded doctrine of a balance of trade, or indulges a childish fancy for gold and silver as the only or principal characteristics of national wealth? Who does not now see that bounties upon exportation can have no other effect than, by diverting capital to branches of employment which cannot be sup-

ported without them, to deprive other branches, which require no such aid, of their necessary supply, or to prevent the capital so diverted, from establishing new and independent modes of employment for itself? And who does not acknowledge, that, besides this negative disadvantage, the positive evil of a double-tax does not result to the community; one to pay the bounty, and another in the advanced price of the commodity in the home market, after part of it has been forced abroad by the bounty? It is pretended, that new and hazardous manufactures and departments of trade are cherished by this expedient. We should be glad to know any one particular manufacture or branch of trade which could be fairly proved to have derived its maturity from this cause. On the contrary, the very nature of the thing seems to indicate the impossibility of the fact. No expedient could more effectually bribe the indolence and negligence of those who were to receive the bounty. Trusting to their profit at all events, in the premium to be paid to them from the public revenue, the inducement to extraordinary skill and dexterity must be prodigiously lessened. The fact accordingly we believe to be, that whenever the bounty has been withdrawn from any branch of manufacture or trade, that owed its origin and first progress entirely or mainly to it, languor and decay have been the consequence. We say "entirely or mainly;" for where the physical, local, or moral circumstances of the country, afforded sufficient encouragement of themselves, the expedient of a bounty was only the more absurd, and could serve only to retard the natural progress to maturity.

Bounties being distinguished as they relate to the defence, and as they relate to the commercial prosperity of the state, a third sort may be regarded as arising from both. This properly forms no new class, but is merely a compound of the elements of the other two. To this class may be referred all the different bounties upon exportation which we have just been considering. All of them, it is said, encourage more or less the extension of our navigation and shipping. But this effect, if it exist at all beyond what would otherwise have taken place had the export and import trade been left to their natural balance, exists in so subordinate a degree, and is so little insisted upon in comparison of their other great result, the pretended favourable balance of trade, that they must always be principally viewed as affecting our commercial prosperity. There are, however, bounties of this mixed description, which deserve to be considered as principally affecting the defence of the state. Of this sort are the bounties upon the sail cloth and gunpowder exported. That as much of these commodities would by this time have been manufactured in this country without the encouragement of the bounties as with it, is at least problematical; and our security has at every different point of time been too closely connected with a full and ready supply of them, to have allowed them to depend upon a balance of probabilities.

But by far the most interesting bounty of this mixed character, is that given upon the exportation of grain. Dr Smith condemns it, not only on the principle applicable to all other bounties upon exportation, but also on the principle peculiar to itself, that

it has little or no tendency to enrich the parties more immediately concerned. Nor, according to him, has it ever had any effect in extending the quantity of corn grown; so that it can have no operation in securing the country against a scarcity, in the event of a war with the grain countries of America or Europe. Mr Malthus, on the other hand, maintains, that it not only produces both these effects, but that, unlike other bounties, it occasions an actual reduction in the price of grain to the community at large. By arguing upon its principle, he has endeavoured to shew that it must have a tendency to enrich the land-proprietor and farmer in a similar manner, and nearly in a like proportion, as other bounties affect the interests of the export merchant and manufacturer; and, by a statement of facts as well as argument, he asserts its beneficial result, in having greatly extended the tillage and consequent produce of the country, as well as in having considerably reduced the average current prices. The just conclusion appears to us to be, that while, with Dr Smith, its effects on the general society must be regarded as no better, in a *commercial* point of view, than those of other bounties on exportation, its *political expediency*, in having extended the tillage of the country, must, on the other hand, be conceded to Mr Malthus. He is right, we think, in asserting its tendency to enrich the parties more immediately concerned, in the same manner as the bounties upon manufactured commodities exported; but we are far from being convinced of its efficacy in lowering the average prices in the home market. We must not omit to add, that although this acute and intelligent writer has defended the principle of the corn bounties, he is by no means a friend to this or any of the doctrines of the mercantile system. "If throughout the commercial world," says Mr Malthus, whose liberal philosophy has shed a ray of light through the gloom of prejudice which still envelopes his native, as well as its sister, university,—“if throughout the commercial world every kind of trade were perfectly free, one should undoubtedly feel the greatest reluctance in proposing any interruption to such a system of general liberty; and, indeed, under such circumstances, agriculture would not need peculiar encouragements. But under the present universal prevalence of the commercial system, with all its different expedients of encouragement and restraint, it is folly to except from our attention the great manufacture of corn, which supports all the rest. The high duties paid on the importation of foreign manufactures are so direct an encouragement to the manufacturing part of the society, that nothing but some encouragement of the same kind can place the manufacturers and cultivators of this country on a fair footing. Any system of encouragement, therefore, which might be found necessary for the commerce of grain, would evidently be owing to the prior encouragements which had been given to manufacturers. If all be free, I have nothing to say; but if we protect and encourage, it seems to be folly not to encourage that production, which, of all others, is the most important and valuable.”

The term bounty, it may further be observed, is, in common speech, sometimes applied to those premiums which are occasionally given by the govern-

ment, but more frequently by certain public-spirited societies, for the encouragement of extraordinary ingenuity and skill in particular departments of the arts. But there is little danger of confounding this application of the word with its proper and more important one. The premiums so bestowed are of inconsiderable amount, and can never engage the public attention as a matter of national expenditure. They cannot be regarded as having the least effect in disturbing the natural tendency to a balance in the employment of the general capital. And economists are agreed, however opposite the systems they may have adopted, that the money so expended is beneficial to the commonwealth. (J. B.)

BOURBON, or MASCARENHAS, an island in the Indian ocean, lies in S. Lat. 20° 52', and E. Long. 55° 30', about 100 miles W. S. W. of Mauritius, and 370 east of Madagascar. When first discovered by the Portuguese, it received the name of Mascarenhas; but this was afterwards changed by the French into Bourbon, and, during the revolution, into Reunion, which, in the servility of adulation, sunk in that of Bonaparte. Its form is nearly circular, and, when seen from a distance, it appears to rise gradually from every side to a high-peaked point near the centre, the altitude of which is estimated at 9,000 feet above the level of the sea. It is 38 leagues in circumference, when following the principal windings of the coast; and its greatest diameter, from Pointe des Galets to Pointe de la Table, is 14 leagues.

This island is composed of two volcanic mountains, the Gros-Morne, and the Volcano; the latter of which still exercises its tyrannical devastations, and is perpetually emitting either flame or smoke. The Gros-Morne, which lies towards the north, and which is of the greatest dimensions, has long ago ceased its eruptions; but every feature of the surrounding country,—rapid rivers running deep between perpendicular ramparts, and impeded in their course by immense rocks—numerous craters—basaltic prisms, often disposed in regular colonnades—various beds of lava, and deep vallies and ravines, all indicate the terrible physical revolutions to which it has formerly been subject. Ages, however, have passed, since the northern parts of Bourbon have been freed from the ravages of subterraneous fires. Its bleak surface has been converted into a fruitful soil, by the action of the atmosphere, and the industry of man; and rich plantations of coffee, and immense corn fields, now adorn the plains, which were formerly covered with liquid lava. But towards the south, the country becomes sterile and scorched, from the great scarcity of springs, and its proximity to the volcano; and the Pays Brulé, or *burnt land*, extending over a surface of 12,300,000 square toises, is one continued desert. Bounded on the south by the ocean, and rising with a lofty ascent, it is terminated on the north by the burning dome of the volcano. Its barren and fuliginous aspect, and the dreary solitude which reigns around, without a habitation to break the uniformity of the prospect, presents a frightful picture of desolation. Since Bourbon was first known, the volcano has never ceased to disquiet its inhabitants; and from actual observations since 1785, it has been ascertained, that it regularly vomits lava at least twice every year, and that in nine of these eruptions, the

lava has reached as far as the sea. But should this volcano, which, we have every reason to believe, has already traversed the whole island, make another tour, and renew its devastations in some other quarter, this desolate region might easily be recovered, and rendered habitable and fertile.

In the line of contact of these two mountains, which runs from N. E. to S. W. the ground rises on both sides with a gentle ascent from the sea. In this line are the Plaine des Cafres, and the Plaine des Palmistes, through which lies the only road of communication between the opposite sides of the island, and which, by way of eminence, is called the *Plain*. The Plaine des Cafres is very unequal, and is rather a number of flats rising insensibly one above the other, than a level plain. Its highest elevation is 4,800 feet above the level of the sea, while its lowest is only 3,600. It is little better than a desert. A tree is scarcely to be seen. A few tufts of shrubs are its only productions, and the more elevated places are absolutely bare, or covered only with heath. On the N. E. lies the Plaine des Palmistes, which forms a striking contrast to the sterility of the Plaine des Cafres. It is every where covered with the most luxuriant verdure, and is watered by the river Seche, which traverses its surface in a serpentine direction, and receives from its sloping sides many tributary streams. This plain resembles an immense circle, surrounded on every side, except towards the ocean, by a rampart, rising gradually from the centre to the height of 1,800 feet above its base, and 2,700 above the level of the sea. It received its name from a species of tree with which it abounds, and concerning which a circumstance is mentioned by M. Bory, which is particularly worthy of observation. We give it entirely upon that gentleman's authority, and in his own words. "Si l'on est assez heureux pour surprendre ces hautes montagnes dans un moment de calme profond, et lorsque tous les vents semblent retenir leur haleins, on pourra verifier l'observation suivante, qui me parut si singuliere que je n'osai pas d'abord m'en rapporter a moi-meme. Je consultai, a ce sujet, l'exact M. Hubert, qui m'a assure avoir remarquer comme moi, que les frondes flexibles des *palmistes*,* lorsque la paix des airs le permet, se dirigent par un mouvement insensible vers le milieu de l'île; il faut etre tres attentif pour saisir cet ordre apparent, qui est peut-être dû a l'attraction que les montagnes exercent: † cet ordre est a peine visible sur un seul arbre, c'est sur l'ensemble de tous les palmistes vus a-la-fois, qu'il faut le chercher. J'ai aperçu, au milieu d'un de ces calmes profonds, des risees indociles echappées d'une gorge agiter toutes les tetes qui se trouvaient sur leur route; bientot apres les feuilles balancées, perdant peu a peu leur agitation, reprenaient leur direction premiere." *Voyage*, &c. tom. ii. p. 389.

Near the middle of the island is a lake about half a mile in diameter, surrounded on every side by a sloping bank, which rises nearly 600 feet above the level of its centre. This lake is called by the inhabitants the Grand Etang, or *Great Pond*. It is between 30 and 40 feet deep; and has no other source of sup-

ply than the rains which fall in its neighbourhood. During a dry season it is sometimes completely empty, which must be produced entirely by evaporation, as it has no other outlet whereby it can discharge itself. A few swallows are the only inhabitants of the place. A thick cloud, in general, rests upon its surface, and the atmosphere around is always foggy and unhealthy.

The rivers of Bourbon find no resemblance in those of any other country. Instead of sheets of water flowing in a level and uniform course, and refreshing the vallies which they embellish, these are torrents, sometimes weak, sometimes strong, tumbling down the sides of the mountains through deep gulleys, which they have formed, or widened, during a long succession of ages; and such is the impetuosity with which they rush through their channels, that huge masses of rock are carried down in their current, whose crash is heard long before they appear, and which, accumulating at their junction with the ocean, form at each side of their mouths lofty and impassable ramparts. These torrents have so furrowed the declivities of the mountains, that one cannot traverse the island, in a line parallel to the horizon, without encountering precipices at every step. The sides of their channels, in many places, form an angle of from 45 to 70 degrees, and those of some of the principal rivers are about 600 feet in elevation. The chief rivers are, *riviere de St Denis*, *riviere Seche*, *riviere de l'Est*, *riviere du Mat*, and *riviere des Remparts*; yet none of these are supplied by springs which issue from the earth, but are indebted entirely to the rains which fall in their neighbourhood, and to the snow and mists, which continually rest upon the summits of the mountains.

In Bourbon, the towns, and the only appearance of cultivation, are confined entirely to the coast, and its neighbourhood; the interior is uninhabited, and even uninhabitable. It is divided, according to M. Bory, into eleven parishes; St Denis, St Marie, St Suzanne, St André, St Benoit, St Rose, St Joseph, St Pierre, St Louis du Gaul, St Leu, and St Paul, each having a town of the same name. St Denis is the capital of Bourbon, and the residence of the governor, the supreme council, and other public functionaries. This town is little better than a village. The church is its only edifice, and the houses are low, and built chiefly of wood. The streets are bordered with trees, and covered with large flints; and resemble, in every respect, many of our common roads in Britain. It is divided into the high and the low quarters; the latter of which is situated at the mouth of the river, and consists merely of a row of shops, possessed by the poorer classes of the inhabitants. The other is built a little behind, at the bottom of the hills, and is inhabited entirely by wealthy colonists. The batteries and public magazines are well supplied with cannon and military stores, and the ordnance captured last year at this place, and St Paul's, amounted to 120 pieces of cannon of all calibres, besides a large quantity of shot, shells, cartridges, and powder, and about 900 muskets with bayonets:

* Fauset nut—the *Areca* of Linnaeus.

† This singular fact cannot possibly arise from the attraction of the mountains, as Bory imagines. We suspect that the true explanation of it will be found in some optical illusion. Ed.

The town of St Rose lies in the bosom of a small bay, and consists entirely of a few cottages, with the church in the centre. It has a convenient harbour, and is most favourably situated for commerce. Separated from the rest of the island by a torrent often impassable, and living on the declivity of the volcano, at the very name of which the other islanders tremble, the inhabitants of this parish have acquired a character analogous to their insulated situation, and have contracted a fierceness of manners, which, however, is now beginning to be softened by their intercourse with the other parts of the country. They are almost entirely ignorant of the use of money. All their bargains are made in merchandize; and those who supply them with arrack, blue cloth, flints, pipes, powder, and lead, which are their principal necessities, receive in return coffee and honey.

The parish of St Joseph is also, in a manner, separated from the rest of Bourbon. A furious sea, and inaccessible coasts, and a stony and ungrateful soil, producing only ferns and impenetrable forests, were the obstacles which long opposed every attempt to colonise it. *Marons*, or runaway slaves, wild goats, and a few other animals, were of late its only inhabitants: and it was but in 1785 that this parish was first established, and peopled with men of colour. Born free, from father to son, these men look upon themselves as whites. They will not suffer the least reflection upon their complexion, and consider it an unpardonable outrage to be called a man of colour, or a free black. Too proud to stoop to labour, which they think dishonourable, they live chiefly upon the produce of the rivers and the woods; and habituated to every privation, they are at the same time active, indefatigable, and idle. Just, but severe, towards their slaves, they are inflexible and cruel to the *marons* when they fall into their power. They are, however, open, full of candour, incapable of deceit, hospitable, and generous.

St Pierre is a considerable village, but widely scattered by reason of the gardens, with which every particular property is surrounded. Some of the houses are neatly built of stone, and have double stories. Cotton, of an excellent quality, was formerly the principal commodity of this parish; but since colonial produce has become of so little value in the European markets, their attention is now chiefly confined to the cultivation of corn, two-thirds of which are annually exported to the Isle of France. Here the climate is warmer than in any other part of the island; and from the nakedness of the country, the form of the habitations, the greatness of the temperature, and the clearness of the sky—rarely overshadowed by a cloud—one might imagine himself in Arabia, or in the centre of Africa.

St Paul is the most considerable village next to St Denis, and the best peopled parish of the island. It is surrounded on the land side by a semicircular rampart, extending nearly six miles from the Pointe du quai Houssaie to the Riviere des Galets, and varying in height from 100 to 250 feet. The town is built at the bottom of a steep mountain, on both sides of a fresh water lake. This lake might easily be converted into a safe and commodious harbour; and for this reason it ought to have decided the French go-

vernment, when they took possession of Bourbon, to fix the capital of the island at St Paul. The roadstead has good anchorage ground of a hard sand, reaching two miles from the shore. Its figure is semicircular, a little open, and it is well protected on the north by a cape, which forms the mouth of the Riviere des Galets, and on the south-west by rocks and the Pointe du quai Houssaie. The other parishes have a fruitful soil, and are in general well cultivated, but possess nothing deserving of notice, except St Leu, which is famous for its coffee, its wealth, and the inhospitable disposition of its inhabitants.

The climate of Bourbon varies greatly in different situations. While the inhabitants on some parts of the coast are exposed to all the inconveniences of the tropical heats, those on the more elevated regions enjoy all the richness and coolness of the temperate zones; and in the Plaine des Cafres the cold is so intense, that it is very dangerous to enter upon it when in the least degree overheated. An icy and sudden wind from the neighbouring mountains may in a moment prove fatal to the constitution; and the bones of men and of animals, which are to be found in the cavities by the way side, attest its pernicious influence. No where, however, is the climate so hot, as might be expected from the latitude of the island. The air is pleasant and wholesome, and the inhabitants, in general, live to a very great age. They are refreshed by continual breezes from the mountains, and the snows, which accumulate during the winter upon these heights, furnish, during the summer, a plentiful supply of water to the parched herbage of the plains. But Bourbon owes its salubrity, in a great measure, to the hurricanes, which purify and cleanse the atmosphere of every deleterious and noxious ingredient. They have, in general, one or two of these every year, which seldom exceed two days in continuance. They happen between the months of December and March; and it has been observed by the inhabitants, that the want of these periodical storms is invariably succeeded by unwholesome seasons. Their approach is prognosticated by a frightful and hollow noise in the mountains, accompanied by a dead calm, both at sea and on shore; and the night preceding the storm the moon appears of a crimson colour. By these prognostics the Bourbonese are enabled to make a timely provision against their consequences. Though it is an opinion that earthquakes are the attendants of volcanoes, and are most frequent and violent about the commencement and extinction of their combustion, yet this island has been seldom visited by any of these terrible concussions; but has enjoyed, in this respect, more tranquillity than many countries less exposed to volcanic eruptions.

In Bourbon, the soil is no where of any great depth, there being immediately underneath a black burnt rock, resembling the Pays Brulé: but though not deep, it is wonderfully fruitful, producing corn, coffee, sugar, cotton, and cloves, in great abundance; and, in 1763, upon an extent of 125,909 acres of cultivated land, there was gathered as much cassava as would feed their slaves, 1,135,000 pound weight of corn, 844,100 pounds of rice, 2,879,000 pounds of maize, and 2,535,100 pounds of coffee, which last

was bought up by the French East India Company, at about 3d. per pound. But this abundance is owing more to the fertility of the soil, than the industry of the colonists. Their system of agriculture, though superior to that of the Mauritius, and the neighbouring islands, would still admit of great improvements. The plantations of cotton of a superior quality may be greatly extended; and, indeed, the quantity of produce of every description might be considerably increased. The coffee plant, now cultivated in Bourbon, was originally brought from Yemen in Arabia, in 1718. It is the principal production of the island, and was formerly a great source of wealth to the inhabitants, and of revenue to the government. Before the French revolution, it was reckoned little inferior in quality to that of Mocha; but since that time it has been rapidly degenerating; and from the interruptions of commerce, and the difficulty and risk of exportation arising from the continued warfare between Great Britain and the mother country, coffee has almost ceased to be an object of attention. Its cultivation has been much neglected, and it is now inferior to the coffee of the Antilles, or even to that of St Domingo, which has, in general, been held in very little estimation. The clove tree was first introduced into this island by M. Poivre in 1772; but it has never been brought to equal that of the Moluccas or Amboyna. It is, however, a considerable article of commerce, and, in some years, will produce 150,000 lb. weight; but, at other times, it will scarcely exceed a third of that quantity. Bourbon produces also white pepper, gum-benjamin, aloes, and tobacco; and the honey of St Pierre, which they call *miel vert*, passes for the best in the world. It abounds with palm and other kinds of wood, many of which yield odoriferous gums and resins; and its fruits are guavas, bananas, oranges, citrons, and tamarinds. The total value of the agricultural produce of the island has been estimated at 1,430,800 dollars.

When this island was first discovered, it was destitute of every species of frugiverous or ravenous quadrupeds; but its rivers were well stocked with fish; its coasts with land and sea tortoises; and its woods with paroquets, pigeons, turtle doves, and a great variety of birds, beautiful to the eye, and pleasant to the palate. The *dronte** is represented by some travellers as a native of Bourbon; but this singular bird, with many others described by the first navigators, have now become extinct in the island, having been destroyed by its early inhabitants, many of whom lived entirely by fishing and the chase. Few of its present animal productions are indigenous. Horses, oxen, hogs, and goats, were first imported by the Portuguese, and they multiplied so rapidly, that when the French visited the place about a century afterwards, in 1653, they were found wandering in bands through the woods. But since the island was colonised, they have as rapidly decreased. The horses have been reduced to servitude, the oxen domesticated, the hogs destroyed, and a few goats only have escaped the spear of the hunter, by retiring to the most inaccessible recesses of the mountains. No ve-

nomous creature is to be found in the island, and only two which are disagreeable to the sight; these are spiders of the size of a pigeon's egg, and very large bats, which are not only skinned and eaten, but are esteemed the greatest delicacy of the place.

The commerce of Bourbon has of late been very much cramped; for, except the petty traffic carried on with the Americans, consisting chiefly in the exchange of provisions for hard-money and lumber, its trade is confined to Madagascar, the Comoro Islands, and the Arab settlements on the eastern coast of Africa. This trade consists in the barter of prize goods, spirits, fire-arms, and ammunition, for black cattle, rice, gold-dust, elephant's teeth, and slaves. It may be called, however, the granary of the Mauritius, as it supplies that island with one half of its provisions; and since it became a British colony, its trade may now extend over the whole range of the eastern coast of Africa, and thence along the shores of Arabia, to the mouth of the Euphrates. The public revenue of the island, in 1810, was estimated at 230,000 dollars.

The population of this island, ever since it became a French colony, has been annually increasing. In 1717, it was computed at 2000, of which 900 were free, and 1100 slaves; and, in 1763, it had increased to 4000 whites, and 15,000 slaves. Viscount de Vaux states it at 56,000, of which 8,000 are whites and mulattoes, and 48,000 slaves; and, according to the computation of an officer of the late expedition, in 1810, it consists of 90,346, of which 16,400 are whites and creoles, 3496 free blacks, and 70,450 slaves. Among this people, however, the usual distinction of whites and blacks entirely fails, for even the free are of different colours; and M. de la Barbinais assures us, that he saw in a church one family, consisting of five generations, of all complexions. The eldest was a female, 108 years of age, of a brown black, like the Indians at Madagascar; her daughter a mulatto; her grand-daughter a mestizo; her great-grand-daughter of a dusky yellow; her daughter, again, of an olive; and the daughter of this last, as fair as any English girl of the same age. This diversity of complexion arises from the French, who had escaped from the massacre at Fort Dauphine, having married their slaves; and it is affirmed, that there are only nine families in the whole island, who have not been united to the African blood.

The inhabitants of Bourbon differ considerably in character and disposition from those of any other colony. Instead of being a motley groupe of strangers from every country, who come merely in search of wealth, and who hasten back to the land of their infancy, the Bourbonese are natives of the soil, and inherit from father to son the patrimony of their ancestors. Hence, they have become so attached to their country, that they have acquired, in a strong degree, what the French call *esprit de province*. Property is not here continually changing its masters. It will remain for ages in the same family, and its possessors live and die in the land of their fathers. This people are, in general, of a gentle and industrious disposition; and are distinguished for their hos-

* A particular description of this curious bird will be found in the *Encyclopedie Methodique*, article *Dronte*.

pitality and simplicity of manners. The ladies are fond of dancing; have both beauty and elegance of shape, a tolerable share of wit, and more taste than could be expected in such a remote colony. They marry at an early age, and are remarkable for their attention to domestic duties, and their attachment to their husbands and children. "Both men and women," says Admiral Kempenselt, "are strong and well made, breathe a wholesome air, are in continual exercise, and are distinguished for moderation and temperance." Their houses are chiefly built of wood, and are very cool and agreeable. They have, however, very little furniture, and many of their apartments are without carpets. But this arises not from the poverty or parsimony of the Bourbonese, but because it is impossible to procure here a third of the conveniences of life. Every object of luxury is brought from the Isle of France, where all foreign commodities are most extravagantly dear.

The Isle of Bourbon was first discovered in 1545, by Don Pedro Mascarenhas, a Portuguese navigator, who gave it his own name. Finding it completely destitute of inhabitants, he erected a pillar of possession upon the shore, and placed upon it the arms of John IV. king of Portugal. From that time it was occasionally visited by the Spaniards and Portuguese, for refreshing their crews and getting water, till 1642, when Pronis, the French commandant at Madagascar, took possession of it in the name of his sovereign, and sent thither twelve malefactors, who had been condemned to perpetual exile. These unhappy men wandered from one extremity of the island to another in search of a precarious subsistence. They lived chiefly upon fruits, and whatever they could procure by hunting; and though in a manner naked, yet they affirmed, that, during the three years they remained there, they never had the least pain or sickness. From their description of the country, M. de Flacourt, a director of the French East India company, who had proceeded on a mission to Madagascar, was induced to form a settlement upon its shores. In 1654, he sent over eight French and six negroes as its first colony, and changed its name into Bourbon. But nothing could be expected from this miserable establishment. Unacquainted with the climate, they lost their first crop by a hurricane; and soon tiring of their solitary situation, and receiving no succour from Madagascar, they quitted the island, and embarked with all their property in an English vessel for Madras.

When the French were driven from Madagascar by the natives, who, provoked at their oppression and licentiousness, surprised Fort Dauphine, and massacred every white that fell into their hands, those that escaped took refuge in Bourbon, where they found, at a very small expense of labour, tranquillity and plenty. These, with the crew of a privateer which had been wrecked upon the coast, and some Indian women that were on board, formed a considerable settlement. Having planted aloes, tobacco, and various kinds of roots, they carried on a small trade with any ships that anchored in their roads for the sake of refreshment; and even built some small vessels of their own, in which they made a trip to Madagascar to purchase slaves, which they employ-

VOL. IV. PART. I.

ed in their plantations. The new colony was thus increasing in numbers, and in wealth, when the French East India Company put in their claim, and assuming the property of the island, sent thither, in 1711, six families and a governor, and established a provincial council dependant upon that of Pondicherry. But the inhabitants, either disappointed in their expectations, or displeased with the government of their new masters, revolted, at the instigation of a priest, seized the governor, clapped him in a dungeon, and kept him there till hunger and sorrow put an end to his existence. The ringleaders of this revolt, however, were afterwards severely punished; and in 1723, the council of Bourbon was declared supreme and independent. But the seditious and mutinous temper continued, and licentiousness, confusion, and anarchy, were the characteristics of this settlement until 1735, when M. de la Bourdennaye was appointed to the supreme command of the Isle of France, and Bourbon. By the active exertions of this gentleman, order and tranquillity were soon restored to the colony; and the inhabitants found it their interest to obey his directions, and to submit to his authority. Under his government, the island soon began to assume another appearance. Industry and subordination succeeded to idleness and disaffection. New forts and batteries were raised, and so well supplied with cannon, military and naval stores, and every other mean of defence, that when Admiral Boscawen appeared before these islands in 1748, he found them so completely fortified, that he was obliged, after some fruitless cannonading, to pursue his voyage.

Upon the breaking out of the revolution, when the mania for liberty and equality was raging in France, these islands resisted with firmness the execution of the decree, issued by the Directory, for the immediate abolition of slavery throughout all their colonies. They cheerfully took the oath of allegiance to the new government in the mother country, but would not listen to the emancipation of their negroes. They swore that they were prepared to die, rather than expose themselves, their wives, and their children, to the licentious fury of barbarians, who might signalize their liberty, by inundating the island with the blood of their masters. By this opposition the colonists were deprived of all support and assistance from France, and were reduced to the dreadful alternative, of submitting to the enemies of their country, or of sealing their destruction, by obeying the orders of the Directory. Their fall now appeared to be inevitable, by resisting the attacks of the English, who were interested in their reduction, or by perishing by the poignards of their negroes, whetted by that government which ought to have been their protection. For eight years they remained in this precarious situation, afraid of every flag that approached their shores, until the Directorial tyranny was abolished, when France again held out to them the hand of amity. The English, however, still meditated a decisive blow against these colonies. The harbours and strong fortifications of the Mauritius had long afforded protection to the enemy's cruisers and privateers. By these our East India trade has of late years been most terribly annoyed; and it has, indeed, been matter of surprise.

S A

that our government should have allowed this nest of pirates to remain so long unmolested. But the blow was only retarded to make it more sure; and an expedition under the command of Colonel Keating, and Commodore Rowley, sailed from India in June 1810, for the reduction of Bourbon. After a gallant defence by Colonel Susanne, the French commandant, the object of the expedition was accomplished on the 8th of July following, when this island surrendered to the British arms, and paved the way for the conquest of Mauritius, the last and most important colony of France. See *Mod. Un. Hist.* vol. xi. p. 159.; Bory de St Vincent, *Voyage dans les Quatre principales Iles des Mers d'Afrique*; Viscount de Vaux's *History of Mauritius and the neighbouring Islands*; and *A Pamphlet* by an Officer of the late Expedition against Bourbon. See MAURITIUS. (h)

BOURBON LAKE, a lake of North America, about 80 miles long, and nearly of a circular shape. It is formed by the waters of the Bourbon river, which rise near the northern sources of the Mississippi. Furs of every kind are obtained in great abundance round this lake. There are no large islands upon it; and, owing to the coldness of the climate, few animals are to be found in the adjacent country. (h)

BOURBONNOIS, one of the former provinces of France, now forming a part of the department of the Allier. The temperature of the province is exceedingly mild; and it abounds in corn, hemp, fruit, wines, pasturage, and wood. It possesses also mines of iron and coal, and numerous mineral springs, the principal of which are at Bourbon-l'Archambaud, Bardou, Neris, Vichy, Saint-Pardou, Trauliere, &c. Near the first of these places there are rocks which contain veins, with small stones, which have such a great resemblance to diamonds, that they are often mistaken for them by connoisseurs. See *Journal Economique de Septembre* 1756, p. 6. (o)

BOURDALOUE, Louis, a celebrated French preacher, was born in Bourges, on the 20th of August 1632. In the sixteenth year of his age, he entered into the society of the Jesuits. The first eighteen years that he spent in it were employed partly in prosecuting his private studies, and partly in teaching rhetoric, philosophy, and divinity. And in every thing he gave striking proofs of the strength and superiority of his genius. Possessing talents that equally fitted him for the attainments of science and the eloquence of the pulpit, he was for a while uncertain to what profession he should devote himself. But some sermons that he delivered while lecturing on practical theology, met with so much applause, that his superiors prevailed on him to apply himself wholly to the office of a preacher. In the commencement of his career, he had the good fortune to be known to the king's daughter, who, having heard him and liked him, honoured him not only with her kindness, but with her confidence; of which she gave an affecting proof, in selecting him to be with her on her death-bed, that she might receive from him the consolation which he was so well qualified to impart. After preaching some years in the country, he was, in 1669, called to Paris, where his appearance in the pulpit surpassed all the expectations

which had been previously entertained of him. People of all ranks crowded to the place where he exhibited, and were charmed with his oratory. Nor, though his reputation was so suddenly acquired, did it at all degenerate, as generally happens in such cases. It increased from day to day; and the oftener he was heard, the stronger was the desire to hear him. He preached for thirty-four years either at court or in Paris: he preached to the great, to the learned, and to the multitude: to all of them he gave the highest satisfaction and delight, and with all of them he enjoyed uninterrupted and growing popularity to the very close of his life. To a zealous performance of his duties in the pulpit, he added very laborious duties of a private nature, by acting the part of a father-confessor to those who were affected by his discourses in the church, and needed consolation for their sorrows, or counsel in their difficulties. He sometimes spent five or six hours in succession, listening to the acknowledgments of the penitent, and imparting to them with equal prudence and faithfulness, the instruction which they required. And on such occasions he condescended to the poorest and the meanest that applied to him; and often sought out those who were unable to come to him, that he might enquire into their circumstances, and administer to their spiritual necessities. His personal conduct formed a counterpart to his public character, distinguished as it was by the habitual exercises of piety and virtue, by uprightness and benevolence, by modesty and contentment, by a mild temper and agreeable manners, by a contempt of the world and the love of peace and good order, by fidelity to his friends, forbearance to his enemies, and charity to all. This assemblage of good and amiable qualities made him a great favourite with all who knew him; and accordingly all ranks courted his company, feeling pleasure in his society, and thinking themselves honoured by his acquaintance. After having spent so many years in the discharge of his ministerial functions in the metropolis, he was anxious to go to some place of retirement, where he would have sufficient leisure to attend particularly to his own spiritual concerns, and to prepare for death, which could not now be far distant. For this purpose he petitioned for leave from the superiors of his order to abandon Paris, and retire to some house in the country. This request, however, though made repeatedly with great earnestness, and in very affecting language, was ultimately denied: And in obedience to that ecclesiastical authority to which he had always made conscience of submitting, he remained in Paris, continuing to labour in his ministerial office with his wonted diligence and fidelity, preaching especially for the benefit of the hospitals, the poor, and the prisoners; and thus sanctifying himself, by promoting the comfort and happiness of others. He fell sick on the 11th of May 1704, and, sensible that his departure was at hand, prepared himself according to the usual forms of his church, but with much piety and resignation of spirit, for that awful event. It is curious but melancholy to observe a man of so much understanding, and so much knowledge of Christianity, talking in such circumstances of offering himself up as Jesus did, a sacrifice to appease the wrath of God, and of consenting to suffer the pains of purga-

tory. Yet such was the language that he actually held. "It is highly reasonable," said he, "that God be fully satisfied; and at least in purgatory I will suffer with patience and with love." He expired on the second day after he was taken ill, in the 72d year of his age; and his death excited universal and unfeigned regret. Different opinions have been entertained of the merit of his sermons. While some have given them the highest praise, others have spoken of them as far below mediocrity; and one writer is so outrageous in his censure, as to say that they are nothing more than empty harangues. It is evident that a man who was so popular as Bourdaloue, in such circumstances as those in which he was placed, and preaching before such audiences as he addressed, must have possessed great talents, and produced excellent discourses: though it must be admitted, at the same time, that popularity depends, in a great measure, on the voice, the appearance, the manner, and the character of the preacher, as well as on the extent of his knowledge, and the strength of his understanding. But really he who can peruse Bourdaloue's sermons without admiration must be destitute either of taste or of candour. They have some great faults, but their excellencies certainly predominate. Dr Blair gives the following character of them, which appears to be tolerably just: "Bourdaloue is indeed a great reasoner, and inculcates his doctrines with much zeal, piety, and earnestness; but his style is verbose, he is disagreeably full of quotations from the fathers, and he wants imagination." The reader will find some good remarks on Bourdaloue's sermons in Hill's *Life of Blair*. (†)

BOURDEAUX, or BORDEAUX, in the department of the Gironde, and capital of what was formerly the province of Guienne, is one of the most ancient and flourishing cities in France. It was known by the name of *Burdigalia*, in the time of the Romans, by whom it seems to have been originally founded, or at least greatly enlarged; and of whose architectural improvements it still retains many distinct vestiges. Besides a number of ancient statues, medals, and inscriptions, which have been found at different periods within its limits, we may mention, as its principal antiquities, a temple dedicated to the tutelary deities of the place, of which some very lofty columns are to be seen; the lower gate, which is supposed to have been built in the time of Augustus; the palace of Gallienus, of which only two gates and a few walls remain; and an oval amphitheatre, 227 feet in length, and 140 in breadth. In the fifth century, it was in the possession of the Goths; and was repeatedly ravaged and burned during the savage incursions of the Normans. It was afterwards governed by sovereigns of its own, who were titled Dukes, Counts, &c.; but by the marriage of Eleanor, only daughter of William the tenth, and last Duke of Guienne, to Louis VII., surnamed the Young, it was united, with its province, to France. This lady, however, having been divorced by the French king, in 1152, and afterwards marrying Henry of Normandy, who succeeded to the crown of England, Guienne, with its capital Bourdeaux, became subject to the princes of that country, by whom it was greatly enlarged and beautified. To this city Edward, the

Black Prince, conducted his royal captive, John, King of France, after the battle of Poitiers, in 1356; made it the seat of his court for the space of eleven years; and raised it to a high degree of splendour and renown. After having been nearly three centuries in the possession of the English, it was reunited to France by Charles VII., who established a parliament in the place, and built the Chateau Trompette, to defend the mouth of the harbour. In the year 1548, a violent insurrection was excited throughout the whole province, by the grievance of a salt tax; and, in the heat of their resentment, the inhabitants of Bourdeaux seized and massacred the king's lieutenant M. de Monem, together with one of his friends who attempted his rescue. The constable Montmorency was dispatched with a body of troops, to suppress these tumultuous proceedings; but though the inhabitants of Bourdeaux submissively opened their gates to receive him, he refused to enter their city, except through a breach in the wall; posted his soldiers with artillery at the entrance of every street, and treated it in every respect as a town taken by storm. He declared its privileges to be forfeited; seized its bells and records; condemned to death 100 substantial tradesmen; imposed a fine of 2000 livres; suspended the parliament from the exercise of its functions; compelled the magistrates, with 100 of the principal citizens, to dig the body of Monem out of his grave with their fingers, that it might be solemnly interred in the church of St Andrews; commanded the town house to be thrown down, and a chapel to be erected in its place, where public prayers should annually be offered for the soul of the murdered governor. Bourdeaux suffered very severely during the civil wars in France, in the time of Henry IV.; but was preserved for the crown by the good conduct of Marshall Matignon, in opposition to all the powers of the League.

The town is situated on the west bank of the Garonne, about 40 miles from its mouth, and where the river is between 300 and 400 toises in breadth. The tide flows, as far as the city, to the height of twelve feet, so as to be navigable for vessels of a considerable burden. The harbour is large and commodious; and the quay, which borders the river, is of very great extent, but neither kept in good repair, nor built with any degree of regularity or magnificence. Indeed, the vessels cannot be brought close to the pavement, but require to be loaded and unloaded by the help of barges. It appears, from the following lines of Ausonius, that the town was formerly of a quadrangular form—

Quadrea murorum species, sic turribus altis
Ardua, ut aerias intrent fastigia nubes;

but its modern appearance is that of a crescent or semicircle, of which the river forms the side. It is surrounded by an old wall, with twelve gates, and three forts; but the ramparts are in a ruinous condition, and all its means of defence are of very little importance. The streets chiefly run towards the harbour, and are in general narrow and inelegant; but since the end of the American war, the place has undergone great improvements, and many new streets have been built, both in the city and suburbs, in a hand-

some style, and on a regular plan. The Chateau Trompette, which was built by Charles VII., and afterwards regularly fortified by the celebrated Vauban in the reign of Louis XIV., and which occupied nearly half a mile of the shore, was purchased from the late king by a company of speculators, for the purpose of being taken down, in order to build with the materials a fine square, and several splendid streets, to the number of 1800 houses; but this plan, which, it has been said, would form one of the finest additions to a city that is to be seen in Europe, has not yet been completed. The finest parts of the city are the Place Royale, where the hackney coaches have their stand, and where there is an equestrian statue in bronze of Louis XV.; the quarter of the Chapeau Rouge, which consists of noble and regular buildings, and the suburb of Chartron, where the principal merchants reside. Bourdeaux contains an academy of belles lettres, of painting, of sculpture, of architecture, of commerce; an university, founded in 1441; thirteen parish churches; a number of religious houses; and several magnificent public buildings. The principal of these are the churches of the Dominicans, Carthusians, and Monks of St Bernard; in which last is the tomb of Montaigne, who was born, lived, and died, at the castle of Brède, in the neighbourhood of Bourdeaux; the cathedral, which contains two remarkable bas reliefs, deserving of the traveller's inspection; the exchange, from which is the finest view of the harbour and the country on the opposite shore, furnishing one of the richest water scenes of which France can boast; and the theatre, which is one of the most magnificent in Europe, in the shape of the segment of an oval, occupying a space of 306 by 165 feet, with the principal front at one end, where there is a portico of twelve very large Corinthian columns running along the whole extent of the front, from which portico is the entrance, by a noble vestibule, to the different parts of the theatre, to an elegant concert room, and to various saloons for walking and refreshments; and the whole of which building was raised at the expence of 270,000*l*. There is a new tide corn mill, which is remarkable for its size, the solidity of the building, and the beauty of the workmanship. There is a large canal formed of hewn stone, with walls four feet in thickness, which leads under the building, and admits the tide, as it comes in, to turn the water wheels; and there are several other equally well built canals, which conduct the water into a large reservoir, from which it flows back, as the tide returns, and gives motion to the wheels in an opposite direction. This immense structure was erected by a company; and the cost was estimated at 350,000*l*. The whole of the houses, and public buildings of Bourdeaux, are built of a white stone, which adds greatly to the splendour of their appearance. The habitations and establishments of the principal merchants are upon a very expensive scale; and their mode of living is luxurious and dissipated in the extreme. The three chief articles of commerce in this city are, the cod and whale fisheries; the fitting out of armaments, and furnishing of stores for the French American settlements, for which it must at present have very little demand; and the disposal of its brandy, wines, li-

queurs, especially the vin de Bourdeaux, generally known by the name of claret, and produced in the neighbouring country, called *Pays de Medoc*. It exports also fruits, resin, pepper, honey, cork, &c. and particularly vinegar to the amount of five or six thousand tons annually, &c.; and manufactures serge, printed calicoes, stockings, delf-ware, white glass, and cordage. Its wines particularly are an incalculable source of wealth to the inhabitants. It is calculated, that, in the district of Bourdeaux, there are produced, *communibus annis*, 200,000 tons of wine; of which 100,000 are exported, 40,000 consumed in the town and its vicinity, and the remaining 60,000 in the territories of France. The quantity of brandy is more variable; sometimes amounting to 20,000 hogsheads annually, and at other times only to 12,000 or 15,000. Among the principal productions of Bourdeaux may be mentioned the article hemp, of which, within a space of 12 or 15 leagues round the town, about 20,000 or 25,000 quintals are raised every year, part of which is exported to Rochefort, Rochelle, and Bayonne; and the rest is employed at Bourdeaux, in manufactories of linen or cordage. Its refined sugars are accounted the best in France in point of quality; and possess a firmness and consistency, which render them peculiarly suitable for exportation. The great trade of Bourdeaux, especially in wines and brandy, attracts an immense number of foreign vessels, so that there are commonly about 100 in the harbour at once, and sometimes during its fairs not less than 500. The greater number of these are from Holland and Great Britain; and those belonging to the latter power, besides taking wines to the amount of 6000 tons, and brandies to the amount of 400 hogsheads, annually, carry away, vinegar, prunes, raisins, turpentine, chesnut, paper, corkwood, honey, capers, olives, and anchovies, in exchange for woollen stuffs, tin, lead, coals, herring, leather, butter, cheese, salt beef, tallow and painting materials. It has two great fairs in the year, which were finally established by Charles IX. in 1565, and each of which lasts about 15 days; but the resort to these free markets, and its commercial prosperity in general, are said to have greatly declined since the revolution. It contains about 100,000 inhabitants; is distant from Paris 89 leagues, and from Rochelle 27; and stands in N. Lat. 44° 50', and W. Long. 0° 39'. It has produced several great men; by one of whom, the poet Ausonius, it is celebrated in these lines,

Burdigalia, est natale solum; clementia cœli
Mitis, ubi et riguræ largæ indulgentia terræ,
Ver longum, brumæ que breves, juga frondea subsunt, &c.

See Arthur Young's *Travels in France*. (9)

BOURGES, the *Avaricum* or *Bituriges* of the ancients, a town of France, formerly the capital of the province of Berri, but now the chief place of the department of the Cher, is situated on the river Erve, at its confluence with the Eure. According to Livy, this was one of the most ancient cities of Gaul. Louis XI., who was born in this place, founded the university in 1466, and conferred several privileges on the town. From the central situation of Bourges, it was declared, at the assembly of the states at Tours in 1484, as the most convenient place in the kingdom for internal commerce, and fairs were established here

by the king, with the advice of both French and foreign merchants. A dreadful conflagration, however, in which 7500 houses, inhabited by 9500 families, were consumed, ruined the commerce of Bourges, which was afterwards transferred to Lyons. The cathedral church is reckoned one of the most beautiful Gothic edifices in Europe; and the college of the Jesuits, which contained the parish churches and many public buildings, was an extensive and magnificent building. The only commerce which is now carried on at Bourges is merely that which is necessary for the subsistence of its inhabitants. It possesses, however, a few manufactures of linen cloths, woollen stuffs, and stockings. Population 15,340. E. Long. 2° 23' 26", N. Lat. 47° 5' 4". See Necquer's *Administration des Finances*, tom. i. c. xi. (π)

BOURGOGNE, one of the former provinces of France, now forming a part of the department of the Cote-d'Or. The soil is very productive, and the country better peopled than any other part of France. Mines of iron are found in every part of the province, and coal and marble are obtained in abundance. (j)

BOURIGNON, ANTOINETTE, a celebrated enthusiast, was born at Lisle, in Flanders, in the beginning of the year 1616. She died at Franeker on the 30th of October, 1680. Her life was not distinguished by any thing very brilliant, or very interesting; and therefore a minute and regular narrative of its events is wholly unnecessary. But certainly a lady who left behind her eight or ten octavo volumes on divinity; influenced by her doctrine the faith both of clergy and laity; and was deemed a fit object of hatred and persecution by sensible men, because she talked and acted like an enthusiast; deserves a more particular notice than what is implied in telling that she flourished in the seventeenth century, and left the world at the age of sixty-four. A few circumstances, therefore, shall be mentioned, to give the reader some tolerable idea of Madame Bourignon. 1st, At her birth she had all the appearance of a monster. Her forehead was chiefly covered with black hair, her upper lip was fastened to her nose, her mouth stood wide open, and, altogether, she seemed to be such an unnatural production, that for some time it was a subject of consultation whether she should be allowed to live. These deformities were, in some measure, got the better of; but she never acquired any thing approaching to personal beauty. In her mother's breast they excited a degree of aversion and disgust, which soon appeared in harsh treatment of her, and which occasioned such altercations between the parents, as deeply to affect the mind and future fortune of the unhappy child. 2d, Though Antoinette had none of those feminine graces which kindle love in the other sex, yet she did not want admirers when she grew up, and admirers too who proffered their hand along with their heart. She was successively courted by a French merchant, a peasant's son, and the nephew of a parson near Lisle: and they were so violently enamoured of her, as to exceed all the bounds of moderation in prosecuting their suit. All this is probably to be accounted for, by that superiority of understanding and that patrimonial fortune which she possessed, and which are frequently as powerful invitations to matrimony, as the charms of

female beauty. But Antoinette had the fortitude to resist every offer that was made to her, from whatever quarter it came, and however strongly it was urged. The surly and ill-natured demeanor of her father towards her mother gave her an early disgust at marriage, and she very soon began to pray that she might never enter into that state. Besides, she was not very old when her mind became tinctured with enthusiasm; and this enthusiasm expressed itself, partly in renouncing every desire of sensual pleasure, and devoting herself to a state of immaculate purity. For while she prayed, "May God grant that I may never marry," she added, at the same time, "give me the grace to become thy spouse." If this last petition, the impious raving of a fanatic, was fulfilled, as she imagined it to be, it may be easily believed that she not only never conceived one thought inconsistent with the most perfect chastity, but that she actually possessed the gift of *penetrative virginity*, by which, like the Virgin Mary, she created in every person that beheld her a total insensibility to the gratifications of the flesh. 3d, Although Madame Bourignon had obtained this complete victory over the sexual passion, her views were not wholly elevated above the world. Avarice was a ruling feature in her moral character. She tried to shew a contempt for earthly possessions; but she could not succeed in making that attainment. And she exhibited, throughout the whole of her life, a fanatical attachment to spiritual things, combined with a sordid and inveterate love of money. At first she resolved to give up the property which devolved to her at the death of her parents; but before she had made this sacrifice to piety, she changed her mind, and took possession of her patrimony. And she justified this step, which in her case had a worldly aspect, by alleging, that otherwise the property might get into the hands of those who had no right to it, or those who would make a bad use of it, and that God had intimated to her that she should need it for promoting his glory. In all her emergencies, indeed, she applied to God for direction, and she uniformly obtained the answer that she wished. But in this instance, the advice which she received was rather more extensive than was suitable to her dispositions, or her intentions. To retain the estate, she readily agreed, but to use it to the glory of God was beyond her purpose. She lived parsimoniously—she bestowed nothing in charity, and her fortune, therefore rapidly increased. Increasing in wealth, she increased in her attachment to it, and obstinately persisted in refusing to give one mite to the poor, because, as she said, she had consecrated her substance to God, and all human things are inconstant. While, however, she had no compassion for the needy, she had a strong affection for her own doctrines; and expended a certain portion of her money in publishing books, for the edification of the world, and in supporting some idle hypocrites, who attended her as her disciples. This was advancing the divine glory. But it was also a plea for the woman's avarice, and a mean of gratifying her spiritual pride. 4th, Madame Bourignon lived in persecuting times; and it could not be expected that one so active in propagating heretical opinions could escape the rigours of intolerance. But the persecutions that she suffered

were owing, not so much to the bigotry and illiberality of others, as to the unamiable temper of her own mind, and the extravagant and hurtful fanaticism of her own conduct. She was totally destitute of the humility that became her—she was of a morose and gloomy disposition—she judged most uncharitably of the spiritual condition of all who did not adopt her peculiar tenets—she was hard-hearted to the poor, though she affected to love, and to be united to their Father in heaven—she was most unforgiving to those who had robbed her of the merest trifle—and her enthusiasm was carried so far, and had such an effect, that the little girls of an hospital, in which she was governess, were all engaged, as they themselves believed and declared, in a carnal connection with the devil. Considering these circumstances, and considering the arrogance and masculine zeal with which she endeavoured to enlighten those who were far more enlightened than herself, it is not wonderful that she was involved in lawsuits, and difficulties, and sufferings. She did not, however, want protectors and patrons. The baron of Latzbourg preserved her from her enemies at a critical period. And M. De Lort, superior of the oratory at Mechlin, who became a proselyte to her system, if system it can be called, patronised and cherished her while he lived; and what pleased her more, though it evidently occasioned her some trouble, left her heir of all his property when he died. 5th, She was a perfect enthusiast—one of the most extravagant visionaries that have ever appeared in the Christian world. From her infancy she daily conversed with God, in the literal sense of that expression—she offering up prayers, or putting questions to him, and he answering her, by speaking inwardly to her heart, so that she knew what he said to her as distinctly as if a fellow creature had been talking to her. Besides this *sweet conversation*, as it was called, with God, she enjoyed some extraordinary revelations, which, as often happens in similar cases, are wonderfully useless, and wonderfully absurd. In one of her extacies, she was permitted to behold Adam in the form that he had before the fall, and to see the manner, in which he himself, possessing the principles of both sexes, was capable of procreating other men! How suprising that her *penetrative virginity* allowed her to indulge in such a contemplation! The contemplation, however, was purely abstract. When she made any proselytes she felt the same kind of throes and pangs in producing those spiritual children, that are experienced in natural labour, and the violence of her pains was proportionate to the impression which her doctrine made upon their minds. These, and many other instances of a similar nature, that might be adduced, shew that she was an enthusiast of the sublimest order. 6th, It may be easily supposed that her doctrines are supremely wild and extravagant. A sample of them may be seen under the article *ANTICHRIST*: and for the rest, the reader's curiosity can be gratified only by perusing her own works, and the writings of her apologists. Her opinions were adopted by considerable numbers, both in this country, and on the continent. Besides the striking peculiarities of her doctrine, there were several circumstances in her condition which tended to promote her credit.

Of these, the most remarkable was, the appearance of a comet at her birth, of another when she commenced author, and of a third when she died. Surely, said the superstitious, this was a prophetess. Her disciples were most numerous in Scotland: indeed her tenets gained so much ground there, as to become an object of great jealousy with the church. In four different meetings of the General Assembly, (1700, 1701, 1709, 1710,) measures were adopted for checking the growth of this pernicious and blasphemous heresy. Dr George Gardin, a minister of Aberdeen, was deposed, in 1701, for teaching its "damnable errors." And all entrants into the ministry were required, as they are at this day required, to abjure and renounce Bourignian doctrine. See the *Works of Madame Baurignon*; *Bayle's Dictionary*, art. *Bourignon*; *Snake in the Grass*, by Mr Charles Lesley, preface; *Bourignonism Detected*, by Dr Cockburn; and *An Apology for Mrs Antonia Bourignon*, supposed to be written by Dr G. Gardin above mentioned. (r)

BOURN, a town of England, in the south of Lincolnshire, situated in a valley upon a small stream. The remains of a priory, and of a castle, with large irregular works, said to have been formed by Oliver Cromwell, are still to be seen. There is here a mineral spring of some note. There are also some tanneries; and the little commerce which it carries on is by means of vessels of ten tons burthen, which carry goods to Spalding, Boston, &c. Number of houses in 1801, 282. Population 1474. See Gough's *Camden's Britannia*. (w)

BOURO. See BOERO; and Stavorinus' *Voyages to the East Indies*, vol. ii. p. 301; also Labillardiere's *Voyage*, vol. ii. p. 308.

BOUTON, or BOOTEN, or BUTTON, one of the Celebesian Isles, situated about twelve miles to the south-east of Celebes. The island is large, woody, and tolerably high. It is about thirty miles in length and eight broad, stretches from north to south, and is separated by the straits of Bouton from the smaller Island Pangasane, which lies between it and Celebes. The King of Bouton, to whom the neighbouring islands are subject, was in alliance with the Dutch East India company, who paid him an yearly salary of £32 : 14 : 6, that he might assist in the extirpation of all the clove trees in this and the adjacent islands. With this view a serjeant, styled the Extirpator, was sent out every year by the company; and, attended by guides and interpreters provided by the king, he laid waste all the clove trees in Bouton and its dependent isles. The sovereign of Bouton, however, tired of the system of annual destruction, refused to lend his usual assistance, and in the year 1775, when Stavorinus visited the island, the Company withheld their salary, in order to force a compliance with their wishes.

To the east of Bouton is an immense cluster of little islands, called Toucan-bessis, connected or surrounded with rocky shoals. The passage between Bouton and this cluster is very dangerous. "Along the shore of Bouton," says Stavorinus, "there is no danger to avoid but the land itself, but in the narrowest part of the passage begins a large bay, which runs into the land west and north, into which there

is much danger of being drawn by the currents which set into the bay, if the point opposite to the Toucan-bessis be approached too near in calm weather; and if you have once fallen into the bay, there is no getting out till the west monsoon sets in again. The governor of Banda was once detained a whole year in this vexatious gulf, which, on this account, received the name of Divaal, or Mistake Bay." The capital of Bouton is Cullasusurf, which is situated on the top of a hill about a mile from the sea, and surrounded with walls. According to Bougainville, the inhabitants, who are small, and of a dark olive complexion, cultivate rice, maize, yams, and other roots, besides cocoa nuts, citrons, and pine-apples. They carry on a considerable commerce in pearls, cloths, and slaves. The inhabitants, who are Mahometans, are gentle and faithful. They work a kind of coloured cotton stuff, and obtain their spices from Ceram and Banda. See Stavorinus' *Voyage to the East Indies*, vol. ii. p. 297—301; and Bougainville's *Voyage*. (H)

BOW, a well known offensive weapon, which has been used in war and hunting from times of the most remote antiquity. Although the invention of the bow is, at first sight, extremely obvious and simple, yet the application of a missile body along with it, renders the use of it more complicated. Hence the rudest class of savages are entirely unacquainted with its properties, though they possess weapons apparently of more difficult construction.

The form and substance of the bow have been greatly diversified in different countries: wood, horn, and steel, have all been successively adopted; but the first, from convenience, is in most general estimation. In Tartary, Persia, and other eastern regions, bows are manufactured from the horns of the antelope, and beautifully ornamented. They are sometimes composed of wood and horn, two pieces of equal length being applied parallel to each other, bound together by catgut, and then covered with the smooth bark of a tree, which receives suitable decorations, and a coat of varnish. The Laplanders are said to frame their bows of two flat pieces of birch and fir glued together; and in England, the modern bows are constructed of yew or cocoa wood, with a slip of ash, or some other elastic wood, glued on the back.

The figure of the bow has undergone many alterations. To judge from the coins and sculptures of the ancients, it was straight in the middle, and curved at each end: the modern Tartar bow unstrung, nearly resembles an incomplete ellipse, and is recurved until the ends almost meet. The Saxon bow was partly curved, but that of our English predecessors straight. However, it is not improbable that the fashions of different countries have, at various periods, resembled each other; and we find in fact both the figure of the Saxon bow, and the loose play of the string being unconfined in notches, among some relics of those eastern nations which claim the highest antiquity.

The bow of the ancient Greeks and Romans was very short, that of the Tartars is still so; and a tribe of diminutive people in the southern parts of Africa use one little more than two feet long. The English long bow was six feet in length, and that of

the South American savages is scarcely shorter. Those modern nations whose cavalry are armed with the bow, use it short for convenience; though it is certain that the force and range of the arrow are augmented by the length of the bow.

The quality of the bow-string is of much consequence, and we are told that battles have been lost or gained by its imperfections. Probably the sinews of animals, or thongs cut from their hides, were first employed, as catgut is now by the eastern nations. But instead of forming a thick and strong cord of a single piece, a number of small filaments, bound together in different places, constitute the string. The long hair of animals, and even that of women, was anciently converted to bow-strings, whence a temple was erected at Rome, dedicated to Venus the Bald. Thus Julius Capitolinus observes, *Prætereundum ne illud quidem est, quod tanta fide Aquileienses contra Maximinum pro senatu fuerunt, ut fuses de capillis mulierum facerent quum decessent nervi ad sagittas emittendas, quod aliquando Romæ dicitur factum. Inde in honorem matronarum templum Veneri Calvæ senatus dicavit.* Analogous facts are related by Cæsar and Dio. The substance most approved of by the moderns for bow-strings is hemp; for though catgut be tough and strong, it is too liable to be affected by the temperature of the weather.

The arrow has invariably been made of light reeds, or splits of board pointed with harder wood, bone, or metal, according to the facility with which these substances could be procured by the bowmen; or barbed in certain countries, so as to inflict a more dangerous wound. The arrow of the ancient English archers, as at the battle of Agincourt, was a full yard in length; that of some modern South Americans, exceeds five feet. The whistling arrow, which produces a sound, from an enlarged hollow head containing holes, is said to be used by the Chinese for making signals: and we read of an entertainment given to Henry VIII. in 1515, where "the arrows whistled by craft of their head, so that the noise was strange, and great, and much pleased the king and queen, and all the company."

Such are the bow and arrow in their simple state. Their power and effect depend on their peculiar construction, and the skill of the archer combined. But in the use of this instrument, the skill of the moderns seems to have declined on the European continent, and in Britain. The range of an arrow's flight is here under 200 yards; but there was lately a Turkish ambassador in London, who, in displaying his strength, shot to the distance of 480 yards; and a recent traveller mentions a random shot by Hassan Aga, a Turkish governor of Athens, which, on measurement, he found to be 584 yards. In accounts of the ancient English bowmen, we read of arrows reaching a mile at three flights. Much depends on early education and continued practice: and it has always been a received opinion, that in youth alone the rudiments of archery can be learned.

The bow and arrow are extensively used at the present day, and this weapon anciently held a distinguished place in warlike operations. But now the only civilized nation having numerous and regular troops armed

with the bow, are the Chinese. In all others it is gradually giving place to fire-arms, by which it will soon be totally supplanted: In China, however, match-locks only, and not the modern improvements in gunnery, are known; and the rigid adherence of the people to the customs of their ancestors will long preserve the bow as a warlike weapon. The power of the bow is estimated by weight: thus, in describing one as a sixty or seventy pound bow, it is meant that the power required in bending it would raise sixty or seventy pounds. The weakest bows used in the army are of fifty pounds: the common weight is eighty or an hundred, and some even go higher. A strong attachment prevailed for the English long-bow, from the service of which it had proved in battle; and it was not totally eradicated in Britain until the seventeenth century.

To render the effect of this weapon still more deadly, the point of the arrow has been embued with poison, so deleterious in its nature as to occasion instant death. This is not a new invention; for, independent of what is observed by others of the ancients, Justin the historian mentions poisoned arrows as known in the time of Alexander the Great. *Cum venisset ad urbem Ambigeri regis, ospidani invictum ferro audientes, sagittas veneno armant, atque ita gemino mortis vulnere hostem a muris summoventes plurimos interficiunt.* (Lib. xii. cap. 10.) Pliny the naturalist specifies a certain tree, from which the Gauls prepared a poison for the arrows with which they shot stags. The art is still preserved among the South Americans, who blow arrows from a tube, as well as shoot them from a bow. A credible author relates an instance of an Englishman having killed a native in a fit of passion at Macassar. Though the king pardoned his offence, the other Europeans resident there, apprehensive that they might themselves afterwards become the objects of vengeance, insisted that he should suffer that punishment which the laws of the country decreed. The king assented, but, willing to save the culprit from unnecessary pain, he himself resolved to be the executioner with a poisoned arrow, and desired the culprit to name the spot to which it should be directed. He chose the great toe of the right foot, which the king struck with an arrow blown from a tube with wonderful precision and dexterity. Though two European physicians instantly exercised all their skill, and performed an amputation far above the wound, the man died in their hands. Experiments with poisoned arrows by other intelligent Europeans prove that they occasion instant death, and that a South American preparation, with which they were imbued, operates with greater speed and certainty than the most deadly poison. Arrows charged with combustible substances, for setting fire to houses and shipping, were extremely common of old; and have been used by the nations of India in repressing the encroachments of the British during last century. (c)

BOW, CROSS. There is only one way of altering the bow from its original simplicity, which is by combining it with a stock. It is then bent by means of a lever, and the arrow is discharged along a groove. The Chinese have a kind of cross-bow, invented, as they affirm, about the commencement of the Christian era, which can discharge ten arrows at once. This, so far as we can understand, is accomplished

from the arrows lying in parallel grooves above each other.

The cross-bow is a powerful and destructive weapon, and, like the common bow, was employed both in war and hunting, and on horseback as well as on foot. It discharged heavy arrows, called bolts, or quarrels, having a square iron head. The conquest of Ireland, in 1172, is said to have been greatly facilitated by the terror which the cross-bow of the English inspired, the weapon being previously unknown in that kingdom. Richard I. was an experienced cross-bowman, and had killed several persons by arrows from his own hand. But he himself at last fell at the siege of Chaluz, by a dart from a cross-bow, at which the recorder of the event testifies little regret, "*neque enim lex ulla æquior est, quam necis artifices arte perire sua.*" Brompton, *Annales*, p. 1278. Cross-bowmen formed a numerous corps in the ancient armies. At the battle of Cressy, in 1346, the first rank of the French army consisted of 15,000 cross-bowmen. At present we are imperfectly acquainted with the power of the cross-bow; but if we can credit the older authors, and, indeed, on considering that the greatest mechanical force may be employed in bending it, it must be very great. The arrow flies from it with equal precision, whence, long after being disused in war, the cross-bow was still retained in hunting. But although some authors of more modern date magnify the art of their contemporaries, it was much on the decline in the seventeenth century. Wood, in the *Bowman's Glory*, relates, that "in March 1661, 400 archers, with their bows and arrows, made a splendid and glorious show in Hyde Park, with flying colours, and cross-bows to guard them. Several of the archers shot near twenty score yards with their cross-bows, and many of them, to the amazement of the spectators, hit the mark." The cross-bow was prohibited by successive acts of parliament, from the year 1508, and penalties imposed for even being in possession of it. Paul Hentzner, however, who travelled through Britain, in 1598, observes, that he saw in the armoury of the Tower of London, cross-bows, and bows and arrows, of which the English made great use in their exercises.

Not only the men of former times, but women also, used both the bow and cross-bow for amusement. In the ancient illuminated manuscripts of this country are represented ladies of rank with their attendants hunting, and carrying a bow and quiver. Margaret, the daughter of king Henry VII. and queen of James IV. of Scotland, killed a buck with an arrow, on a hunting party, at Alnwick, on her progress thither, in 1503; and Queen Elizabeth, and the countess of Kildare in her train, were equally successful with the cross-bow. Now, though the long bow, and other kinds, are still warlike weapons among the less civilized nations, yet these, as well as the cross-bow, are principally used for amusement in Europe. Societies are formed on the continent for practising the latter, and instead of bolts or arrows, bullets are discharged.

The revival of the long bow, for warlike purposes, has been recommended by some zealous admirers of its effects in antiquity, and they conceive would

yet predominate over the musketry of modern times. Various publications have appeared on the subject; some of recent date even containing a bowman's manual exercise, and proposing to combine the use of the bow along with the pike. The reasons advanced in favour of the bow are undoubtedly plausible at first sight; but we doubt much if they will bear analysis. They chiefly relate to the great precision and expedition in the use of the bow, to the dread which a shower of arrows in their flight would inspire, and to the confusion they would produce. Formerly, indeed, the manual exercise of fire arms, with rests and matchlocks, was a slow and circuitous operation, and even the most expert musqueteer could give only a few discharges in a limited time. Yet, notwithstanding all the modern improvements, it is maintained by the partizans of the bow, that arrows may be sent still quicker from it. Twelve, it is affirmed, may be shot by an expert archer in a minute, and, by one of moderate skill, from six to eight, while not above half as many discharges can be made from a musquet;—"so that archers," as one of these writers observes, "could always be enabled to return two shot for one of the enemy. The advantage must be evident, attending the quick discharge of such falling showers of arrows, the danger of which is seen and apprehended. Is it possible to suppose but the greatest carnage and confusion must take place, even with the best disciplined troops? Let an idea be formed of the terror of the object, in supposing a body of 1000 archers opposed to a like number, or even to great superiority, within their distance. What impression must it not have on the enemy, the sight and effect of at least 6000 arrows, flying upon their line in a minute? Under such flights, kept up without intermission, how would it be possible for them, either horse or foot, to perform their evolutions or exercise, or not to fall into rout and disorder, amidst such carnage and visible slaughter? For musqueteers are enabled to keep their order, as opposed to each other, from not seeing it. But under such galling discharges, if the cavalry could possibly push to the charge of the archers, they would then plant their pikes. This palisade, of a double row of lances, would effectually secure the ranks of the archers from being broke, and enable them, by their terrible discharges, to put their adversaries to rout!"—The partizans of the bow also consider musquet balls less effectual than an equal number of arrows would prove. Marshal Saxe, a celebrated general, computes, that only one ball of 85 takes effect. Others, that only one in 40 strikes, and no more than one in 400 is fatal. At the battle of Tournay, in Flanders, fought on the 22d of May, 1794, it is calculated that 236 musquet shot were expended in disabling each soldier who suffered. On comparing these results with the precision of the bow, it has been maintained, that, at least, every tenth arrow would be effectual, in a discharge from well trained archers. We apprehend, however, that the partiality for archery, as an amusement, has had no inconsiderable influence in recommending it to those who would adopt it as a warlike weapon, and that many important obstacles against its revival have been overlooked. See Moseley's *Essay on Archery*; Mason's *Considerations on reviving the Long Bow and Pike*;

BOWER, WALTER, abbot of St Colm, the continuator of Fordun's *Scotichronicon*, was born at Haddington in the year 1385. At the age of 18 he assumed the religious habit; and, after finishing his philosophical and theological studies, visited Paris in order to study the civil and canon law. Having returned to his native country, he was unanimously elected abbot of St Colm in the year 1418. At the request of Sir David Stewart of Rosyth, he undertook to transcribe the work of Fordun; but, instead of executing a mere transcript, he inserted large interpolations, and continued the narrative to the death of James I. The principal materials for this continuation had, however, been collected by his predecessor. See Irving's *Dissertation on the Literary History of Scotland*, p. 70, and the article FORDUN. (c)

BOYAR, or BOIAR, an appellation given to the Russian lords or grandees. This appellation seems to belong properly to the upper nobility; for in the diplomas of the Czar of Muscovy, the boyars are mentioned before the waywodes. Neither the origin of this class of nobility, nor the precise nature and extent of their dignity, can at present be ascertained. Some have been of opinion, that they were the privy counsellors of the king; in which case, unless we suppose their office hereditary, their precedence must have been merely personal and temporary. Others have maintained, that the original boyars were foreigners of distinction, who carried their rank along with them into the Russian empire. Whatever may have been their origin, it does not appear to be of a very ancient date. No trace of them appears during the Tartarian or Mongolian sovereignty; nor even during the reign of the Czar Ivan Vassilievitch I. We find, however, that, under the Czar Vassilievitch II. they were powerful enough to collect a considerable force; and, even then, their aspiring and turbulent ambition required all the efforts of that monarch to keep them in awe. The distraction into which the empire was afterwards thrown, by the ambitious views of the patriarch and the superior clergy, gave the boyars a favourable opportunity of extending their power. From this period, we find them in possession of the principal offices of state, frequently usurping an undue authority, and involving the empire in confusion and distress. At the framing of the *uloshenie*, or old law of the land, the boyars were consulted, probably as privy counsellors, under which name they were generally mentioned in the ukases. To check their encroachment, and to repress their presumption, an order was issued by Peter I. in 1701, that their names should not thenceforth be mentioned in the public edicts. Upon the whole, it appears that the boyars held the first rank after the sovereign; that they were considered the privileged representatives of the people, and especially of the nobility; and that they took the lead

3 B

in the elections of the sovereign princes. In early times, too, they were commanders of the army, as well as counsellors of the monarch. Prior to the reign of Peter I. they were the prime ministers of state, and viceroys in the various provinces, acting almost without controul. Without the consent of the *Boyar-skoi dvor*, or court of boyars, no law could be enacted, insomuch that all the decrees of government were introduced with this preamble, "By command of the Czar, and with consent of the boyars." Peter, however, abrogated this court, in room of which he instituted the directing senate. This senate consisted at first of nine boyars, and was raised to the rank of the supreme college of the empire. With regard to the etymology of the word boyar, writers are not agreed; but in the dictionaries it is generally interpreted a lord, a person of quality, or a nobleman; and sometimes it denotes a soldier. *Boyarin*, in the Russian language, signifies a gentleman, a person of distinction, or a master of a family; and the boor usually styles his master *boyarin*, or, contracted, *barin*, even though he has neither rank nor estate; and his spouse *boyarina*. The task-service exacted from the boors by their lord, is called *boyarschtschina*. See Tooke's *View of the Russian Empire*. (μ)

BOYLE, ROBERT, was the seventh son, and fourteenth child (the last but one) of Richard Boyle, Earl of Cork, by his second wife, Catharine, daughter of Sir Geoffrey Fenton. His father, a man of more than ordinary ability and address, commonly called the Great Earl of Cork, was a zealous promoter of the Protestant and English interest in Ireland, where he exerted himself with such success in the improvement of his domains, and in the defence of them at the time of the Catholic rebellion, that the Protector Cromwell is said to have declared, on surveying them, if there had been an Earl of Cork in every province, it would have been impossible for the Irish to have raised a rebellion. Of his numerous family, the greater part obtained distinction of rank, and many were eminent in endowments as well as condition. Robert Boyle, however, has secured to himself the principal place in the consideration of posterity. If Bacon pointed out the true way of science, Boyle was the first of our philosophers who struck into it, and pursued it with very considerable success, leaving a track which was to conduct his successors into the high-way of discovery. His name is always coupled with panegyric, and that in a strain above what the occasion will appear to warrant, if we look no farther than into the simple narrative of his life; but upon a careful examination of his works, the eulogium will hardly seem overstrained; for though he may have gained the summit of fame sooner, and with less difficulty, sustained as he was by rank and fortune, than might have been practicable without such support, yet he is indebted to his merit and exertion alone for the place he still holds in the first rank of philosophers. Time, and subsequent discoveries, have confirmed his reputation, and borne the most honourable testimony to his skill and industry in conducting laborious and ingenious experiments, his fidelity in relating them, and his sagacity and discrimination in reasoning from them. His biographers have recorded little that deserves

particular notice of his childhood, and the infancy of the philosopher is less likely to afford prognostics of future greatness, than that of the poet. The growth of reason is more tardy than that of imagination, and with less display of blossom.

Robert Boyle was born at Lismore, in the county of Cork, and province of Munster, in the year 1627. When he was about seven years old, he lost his mother,—a loss which he mentions, in terms of much regret, in his memoirs of the early part of his life. He was reared in the cottage of his nurse, who was instructed to bring him up in the same habits of exercise, and plain diet, as if he were her own child; but this precaution did not prevent his constitution being always delicate and feeble. He contracted one unfortunate habit under the humble roof of his nurse, which he might have escaped in his paternal mansion: Having learned to stutter by imitation, he never had the perfect use of the organs of speech; for though he avoided stammering, he could never speak without hesitation and pauses. Of the moral habits of his childhood, the most remarkable was, a strict regard to truth, which his father said he never knew him to violate. This circumstance renders it probable, that his mind was impressed deeply at a very early age with religious principles; and the same may be inferred with more certainty from the uniformity of his opinions through life, which do not appear to have departed at all from the established creeds, from the style of his religious productions, and from his zeal in the support and propagation of the Christian religion. In the course of his life, he caused translations of the New Testament to be made and published in the Irish, Welsh, and Malay-an languages, and contributed liberally to the translation of the New Testament into Turkish, by order of the Turkey Company. His donations to the propagation of the gospel in America exceeded 300*l*. and by a codicil to his will, he left a revenue of 50*l*. per annum for lectures, consisting of eight sermons in the year, which were to be preached in illustration of the evidences of Christianity, and in opposition to infidel principles. His zeal, however, though it was sufficiently ardent and active to prompt liberal patronage, was uncontaminated with bigotry and intolerance. Bishop Burnet has remarked, that the expression of his sentiments was never pointed with severity and indignation, unless against the abettors of the persecution of religious opinion.

His education commenced in his father's house, under the direction of one of the Earl's chaplains, assisted by a French gentleman who lived in the family. At the age of eight years, he was sent to Eton College, together with his brother Francis, and placed under the care of Mr Harrison. Sir Henry Wootton was at that time Provost of the College. In his eleventh year, his studies were interrupted by an attack of ague, when romances, such as *Amadis de Gaul*, and other works of amusement, were put into his hands, and the pursuit of learning was suspended, till his Latin was almost entirely forgotten. Upon his recovery, he was boarded in the family of the rector of Stallbridge, in Dorset, not far from his father's seat there, and very soon after he was entrusted to the care of M. Marcombes,

a native of France, who had accompanied two of his elder brothers in their travels. In the autumn of that year, 1638, he embarked with his brother and tutor for France. Having visited Rouen, Paris, and Lyons, in their route, they fixed their abode at Geneva, where M. Marcombes' family resided. At the end of three years, they proceeded to make the tour of Italy. During their stay at Florence, the celebrated philosopher Galileo died, within a league of that place. The non-arrival of bills of exchange, which were expected at Marseilles, obliged the tourists to return to Geneva, where they were under the necessity of remaining two years, till at length their tutor, by taking up some jewellery on his own credit, for their use, enabled them to return to their native country. These difficulties appear to have been in part occasioned by the troubles attending the rebellion in Ireland. On their arrival in England, they first received the intelligence of their father's death. Their connections, however, made it easy for them to obtain protection for their estates; and in the following year, Mr Robert Boyle, having obtained permission from Parliament, made an hasty visit to France, probably with a view to the discharge of his pecuniary obligations to his late tutor.

In the beginning of the year 1645, we first find him, now master of his time and actions, and well provided for, living in philosophical retirement on his manor at Stallbridge. Natural philosophy and chemistry were here his chief pursuit; and with what reputation for success may be inferred, from his being chosen, though so young a man, one of the first members of that learned body, then in its infancy, which was assembled in weekly meetings, first at Oxford, and afterwards at London, and was called at that time the Philosophical College, and after the Restoration was incorporated under the title of the Royal Society. Some treatises, which were not published till after an interval of many years, were composed by Mr Boyle at about this period, before he had reached his twentieth year. Of this number are his *Seraphic Love*, his *Essay on Mistaken Modesty*, and his *Free Discourse against Customary Swearing*,—productions of an early age, and possessing no extraordinary merit above the age at which they were produced. Subjects connected with theology divided his time and labour with philosophical research, during this part of his life; and though he was probably never a very critical scholar, he now applied himself with considerable assiduity to the examination of the writings of the Old and New Testament in the original tongues. The first of these studies was an *Essay on the Scripture*, begun about the year 1652, an extract from which, entitled *Considerations on the Style of the Holy Scriptures*, appeared separately. Thirty years after this period, he presented the world with the following treatises, also of a theological complexion: in 1681, a *Discourse of Things above Reason*; in 1683, a *Treatise on the high veneration Man's intellect owes to God*, particularly for his *Wisdom and Power*; in 1686, a *Free Inquiry into the Vulgar and received notion of Nature*. But whatever ingenuity may be displayed in some of his serious and miscellaneous productions, the literary reputation of the author is not at present much indebted to them;

the debt is indeed on their side, as they owe to his reputation that they are known at all. The last of his theological essays, and which bears, as might be expected, a deeper stamp of philosophy than some of his earlier pieces, is the *Christian Virtuoso*: the first part was published by himself; the second appeared in an imperfect state, as he left it, after his decease.

Whatever direction the inquiries and studies of Mr Boyle may have taken at different times, it is as a philosopher alone that he is entitled to the gratitude and admiration of posterity. So early and complete was his conviction that science was not to be promoted by conjectural hypotheses, nor in any other way than that of actual experiment, that he is said, when a young man, to have refused exposing himself to the seduction of the ingenious theories of Descartes, and to have abstained from reading his works, when they were in the hands of almost every student of philosophy in Europe.

Between the years 1652 and 1654, Mr Boyle's studies suffered considerable interruption from the necessity of repeated visits to Ireland; in one of which he found means to carry on some anatomical dissections, with the assistance of doctor, afterwards Sir, William Petty. From the latter date to the year 1668, his principal residence was at Oxford, in the house of Mr Cross, an apothecary of that city, and founder of an hospital, near Amptill, in Bedfordshire. His inquiries were now animated, and assisted by the society of the most eminent philosophers of that day in England, who held their meetings in Mr Boyle's apartments, and there, as has been remarked, laid the foundation of the Royal Society. If the names of Franklin, Priestly, and Black, are respectively associated with the great discoveries in electricity, ærology, and chemistry, that of Boyle must be honoured by every lover of pneumatic philosophy. He was not indeed the inventor of the air-pump; but, in conjunction with Mr Robert Hook, at that time his chemical assistant, he improved the construction of it, so as to render it a more manageable machine, and capable of more successful application. This important service was rendered to science about the year 1659. Long before this improvement was made, Mr Boyle stood high as a philosopher in the estimation of his countrymen, and had been chosen by Dr Nathaniel Highmore as the man to whom his *History of Generation* might be most fitly dedicated. But his first philosophical publication was subsequent to the improved construction of the air-pump.

In the year 1660, he published his "*New Experiments Physico-mechanical, touching the spring of the air.*" This work was translated into Latin, and attacked by Franciscus Linus, and Thomas Hobbes, and defended by himself in a second edition. From this time, few if any years passed, in which the world was not indebted to the labours of Mr Boyle. A catalogue of his works, in the order of publication, would afford no common proof of assiduity and success in prosecuting inquiries into nature; and this evidence, though ample, is defective, as many of his papers were lost; some in the fire of London, some stolen, and others injured by corrosive liquor, from a

phial which his servant unfortunately let fall among them. Of the importance of his annual communications, no just estimate can be formed from a cursory notice of the subjects: the Philosophical Transactions are enriched with many of them, and for the entire catalogue, reference must be made to his works. Though Mr Boyle engaged in controversy, in vindication of his first discoveries, he appears rather to have shunned than sought occasions of that sort. In the conflict betwixt the members of the Royal Society, and the adherents to the old school of philosophy, he took no greater share than was unavoidable, from the nature of his pursuits, and the necessity of justifying the results of them when they were given to the public. This was a duty which he owed to himself and to science; and in the discharge of it, his candour, love of truth, purity, and simplicity of motive, were so apparent, that none of the acrimony, of which the combatants were sufficiently liberal, fell upon him personally. In the controversy that was occasioned by the pretensions of Mr Valentine Greatraks, he did not think fit to stand forth as a public disputant on either side, though, as appears from his correspondence with Mr Henry Stubbe, his thoughts were much occupied about it. Mr Greatraks was the forerunner of those ingenious gentlemen, who have more recently persuaded themselves that they had the power of effecting cures without the aid of medicine, by means of certain sympathies, whose action they have named animal magnetism. His integrity was undoubted; his disinterestedness could not be questioned, as his practice was gratuitous; and many facts, said to be well-attested, were produced in evidence of his extraordinary powers. Mr Boyle was prepared, by his habits of thinking, and his chemical pursuits, not to reject any fact, however new to his own experience, which offered itself to his notice, with sufficient credentials of its truth, for no better reason than his own inability to explain the natural process on which it depended; and his sentiments on the present occasion ought to be considered as the consequence, not of the credulity either of ignorance or superstition, but of the habitual modesty of the philosopher. His opinion on the subject of alchemy should be regarded in the same light. Having steadily opposed the theoretic philosophy, it is not surprising, that, at the dawn of chemical discovery, he did not think himself warranted in pronouncing the transmutation of metals impossible, because irreconcilable with any of the crude theories of which he had shewn the futility. That he was far from a conviction of the impossibility of such a transmutation may be inferred, from his having employed his influence in procuring the repeal of the statute of Henry IVth. against the multiplying of gold and silver.

Mr Boyle continued to reside at Oxford during the Protectorate; and though after the Restoration he was distinguished by many flattering attentions, both from the king and his ministers, the lords Southampton and Clarendon, he declined making any use of their patronage with a view to power or emolument; and though he might confidently have looked forward to the possession of the highest ecclesiastical honours, he refused to comply with press-

ing solicitations to enter into holy orders. His resolution on this subject remained fixed; though, upon the death of Dr John Meredith, he was nominated, by the king, Provost of Eton College. He chose rather to decline an appointment for which he thought taking orders a necessary qualification. The piety of his character leaves no doubt, that this reluctance proceeded from his high sense of the importance of clerical duties, his devotion to scientific labours, and his opinion of the unlawfulness of becoming a member of such a profession, without proposing to resign himself to its service.

After a residence of 14 years at Oxford, Mr Boyle removed to London, in the year 1668, and established himself in the house of his sister, lady Ranelagh, in Pall Mall, with whom he remained till her death, and survived her only one week. Notwithstanding his resolution to accept no situation of high trust, either in church or state, he was induced, in several instances, by his zeal for the promotion of Christian knowledge, to accede to several appointments of less distinction. In 1662, a grant of the forfeited impropriations was obtained in his name, but without his knowledge, which he applied to the service of learning and religion. He was also appointed Governor of the Corporation for propagating the Gospel in New England. With a view to furthering the same design in the East, he was many years a Director of the East India Company.

In 1664, he was elected into the Society of Royal Mines; and, in 1680, he was elected President of the Royal Society, but declined the honour; and, in a letter to Mr Hooke of Gresham College, assigned his particular feeling on the subject of oaths as the reason of his refusal.

Mr Boyle did not possess a firm constitution. In his eleventh year, his studies were interrupted by ague; as early as his 21st year, he had a severe fit of the stone, from which disease he suffered much in the course of his life; and in his 44th year, he was shaken by a paralytic distemper, which was at length subdued by strict regimen. The general state of his health was indeed such, that he found it necessary to adjust his clothing by the varying states of the thermometer. Notwithstanding every precaution, at the age of sixty, he became sensible of a rapid decay of strength, and judged it therefore necessary to make a more economical arrangement of time, and to concentrate his labours. With this view, he made known, by public advertisement, his reason for declining the greater number of visits with which he was honoured, and caused a board to be fixed to his door, which expressed the hours on which visits were received. And such was the simplicity and modesty of his character, that this singularity drew upon him no imputation of vanity and ostentation. Mr Boyle had the satisfaction of seeing the liberties of his country placed upon a lasting basis; he survived the æra of the Revolution about two years. His sister, to whom he was very warmly attached, and with whom he principally lived for nearly 47 years, died on the 23d of December, and himself on the 30th, 1691. His body was interred near that of his sister, at the south side of the chancel of St Martin's in the Fields.

Of his person, which was tall and slender, with a pale and sickly countenance, two portraits remain, one taken in his 38th year, which is copied in the title-page of the quarto edition of his works; the other was executed in the latter part of his life. It was in the collection of Dr Mead, and is supposed to be the same that is now placed in the meeting-room of the Royal Society.

Mr. Boyle, regarded as a philosopher, appears entitled to a place in the very first rank. He shone as the morning star of physical science; and not only were several important discoveries the result of his very accurate experiments, but machines of the greatest value, and of constant use in experimental philosophy, were either invented or improved by him. Of this number were the air pump, the thermometer, and the hydrometer.

As a man of letters, his attainments were considerable. Dr Burnet, who preached his funeral sermon, declares, that his knowledge was of prodigious extent; that he was master of the learned and of several oriental languages, and deeply versed in mathematical science. If we may judge, however, from his publications at a more advanced period, of some of his juvenile productions, written in a very faulty style, his taste never reached the true point of refinement. If, indeed, as Mr Evelyn pretends, his *Seraphic Love* was composed when his imagination was kindled with the love of a mortal, the daughter of the Earl of Monmouth, as he informs us, its production is very well accounted for. His "Occasional Reflections on several Subjects," which were written in his youth, were published when he was near forty, and furnished Swift with an occasion of satire, in his *Meditations on a Broomstick*, in the manner of Mr Boyle. Swift has been severely censured for this attack by many of Boyle's admirers; but if the authority of the name of Boyle was great, it was the more necessary that a false and puerile taste should not find protection in his example. Mr Boyle, whose income was liberal, was a generous and disseminating patron. Dr Robert Sanderson, afterwards Bishop of Lincoln, was among the number of his beneficiaries. In consideration of the losses which he had sustained in the royal cause, Mr Boyle settled upon him an annual stipend of 50*l*. A condition was annexed, that he should prepare a number of cases of conscience for the public, and ten lectures were in consequence published, which had been delivered in Latin, and were now in their present form dedicated to his patron. The piety of Mr Boyle was fervent and active, and its operation was always liberal and benevolent. It has been remarked, in proof of the strength of his religious feelings, that a short pause always preceded his expression of the name of God. It may be doubted, however, whether he thought it necessary to make such a punctilious indication of that veneration of his Maker, which was better displayed in every action of his life; and it is not unlikely that this report originated in a mistake, which is very well accounted for by the habitual pauses and impediment in his speech; the letter *g* was probably one of difficult enunciation.

The manners of this great man are described, such as his letters would lead us to suppose, mild, amiable,

and unassuming, displaying an unwillingness to inflict pain himself, and a disposition to protect the defenceless from rude and unfeeling raillery. Such was the delicacy of his constitution, that, notwithstanding every aid of regimen and strict abstinence, he was often very seriously indisposed, subject to great depression of spirits, and did not survive the 65th year. He lived, however, long enough to leave to posterity a lasting monument of his industry, fidelity, and success, in the pursuits of science; of his zeal and consistency in the service of religion, and of a character adorned with the best social virtues.—See Birch's *Life of Boyle*, (London 1743) the materials of which were taken principally from Mr Boyle's account of himself, under the name of Philocetus, and Burnet's Funeral Sermon. (J. M.)

BOYSE, SAMUEL, a man not more distinguished by his poetical genius, than by his vices and misfortunes, was born in Dublin in the year 1708. His father, Joseph Boyse, was a dissenting clergyman in that city, revered for his piety and learning, and beloved by all who knew him for the native simplicity and dignity of his manner, and his genuine benevolence of heart. After receiving the first rudiments of his education at a private school in Dublin, young Boyse was sent, at the age of eighteen, to the university of Glasgow, probably with a view of studying for the clerical profession. He had scarcely been a year in Glasgow, however, when his studies were interrupted, and his views in life entirely changed, by an unfortunate attachment which he formed for the daughter of a tradesman in that city, whom he married before he had attained his twentieth year. This connection, instead of reclaiming him to habits of virtue, seems only to have opened new temptations to his natural dissipation and extravagance. He became involved in pecuniary difficulties, which obliged him to quit the university abruptly, and to return to Dublin along with his wife, and a sister whom she carried along with her. His follies had produced no change in the affections of the good old man, who, with an indulgence more amiable than prudent, not only relieved him from his present necessities, but continued to support him and his family, without appearing to have urged him to one exertion to procure an independent livelihood. The son was as mean as the father was indulgent. His time, instead of being employed in the pursuit of any useful profession, was lost in the most frivolous trifling; and his thoughtless extravagance at length reduced his father to such indigence, that, during his last illness, he was supported entirely by presents from his congregation; and, after his death, was buried at their expense. Deprived by his father's death of his usual support, he repaired to Edinburgh, where his poetical genius soon procured him some respectable patrons. His first publication was a volume of *Poems on several occasions*, which gained him considerable reputation, and recommended him to the favour of the Countess of Eglinton, a lady of extensive accomplishments, and the avowed patroness of men of genius. Upon the death of the Viscountess Stormont, who was likewise a lady of taste in the sciences, and a lover of poetry, he wrote an elegy, which he entitled *The Tears of*

the Muses. With this mark of respect to his deceased lady Lord Stormont was so highly pleased, that he directed his agent in Edinburgh to give the author a very handsome present. Through the friendship of this nobleman, and the Countess of Eglinton, he was introduced to the Duchess of Gordon, a lady whose acquirements and love of literature led her to cultivate a correspondence with the most eminent poets then living. The prospects of Boyse now began to brighten; his reputation as a poet was established; and the warm interest which his illustrious patrons took in his welfare might have raised him to high respectability, had not their kind intentions been frustrated by his own indolence and infatuation. The Duchess of Gordon procured the promise of a situation for him, which would have placed him beyond the reach of indigence, and gave him a letter, which he was next day to deliver to one of the commissioners of customs at Edinburgh. Unfortunately, however, he happened to be then at some distance from town; and the day on which he was to have delivered her Grace's recommendatory letter happening to be rainy, Boyse declined exposing himself to the weather, and never waited on the commissioner till the place was given away. The indigence and distress, which were the necessary consequence of such imprudence, compelled him to leave Edinburgh, and having communicated to his noble patrons his design of going to London, he received recommendatory letters from the Duchess of Gordon to Pope, and to Lord Chancellor King; and from Lord Stormont to his brother the Solicitor General, afterwards the Earl of Mansfield, and to other persons of rank and distinction. Pope happened to be from home when Boyse called upon him to deliver her Grace's letter, and the visit was never repeated. Though he himself declared that he waited upon the Lord Chancellor, by whom he was well received, and with whom he occasionally dined, the truth of this assertion was doubted by those who knew him best; for he was so overawed by the glare of rank, that he could scarcely lift his eye in the company of the great, or take any part in their conversation. It is certain that his indiscretion prevented him from enjoying the benefit of his recommendations; and his miseries soon became so great, as scarcely to be paralleled in the records of literary history. Even those miseries could rouse him to no other exertion than the writing of mendicant letters. Respect to the memory of his father induced some of the dissenting clergymen to relieve him with occasional benefactions. Yet never, perhaps, was there a more unworthy object of charity; for his indolence and indiscretion were even exceeded by his low selfishness and gross sensuality. With the money which he sometimes extorted by a supplicatory letter, he would go into a tavern, order an elegant entertainment, drink of the most costly wines, and thus squander all the money which he had received, without a single companion to participate the luxury, and while his wife and child were starving at home. It cannot be wondered that his friends, wearied out by his perpetual applications, at length withheld contributions, which they found to be so ill bestowed. His wretchedness accordingly became so extreme, that he had no clothes in which he could appear abroad; even

the sheets on which he lay were sent to the pawnbroker; and he was forced to confine himself to bed, with no other covering than a blanket. His mode of writing in this situation was singular enough: He sat up in bed wrapped in his blanket, through which he had cut a hole large enough to receive his arm, and placing the paper on his knee, scribbled, as well as he could, the verses he was obliged to make. He occasionally supplied the want of a shirt, by tying white slips of paper round his neck and wrists; and in this plight he appeared abroad, with the additional inconvenience of wanting breeches. In this state of misery he continued for several weeks, preserving himself from absolute starvation by writing verses for the magazines, or procuring occasional benefactions by abject petitions, and the vilest arts of deceit. On one occasion, Dr Johnson collected a sum of money to redeem his clothes from the pawnbroker, and in two days after they were pawned again. He translated well from the French, an employment in which he would have been frequently engaged; but by the time one sheet was finished, he generally pawned the original: if his employer redeemed it, another sheet would be completed, and the book again be pawned; and this perpetually. After spending some years in this forlorn and contemptible state, he was invited to Reading, in 1745, by Mr David Hervey, the late proprietor of the Gentleman's Magazine, to compile *An historical Review of the Transactions of Europe, from the commencement of the war with Spain in 1739, to the insurrection in Scotland in 1745, with the proceedings in Parliament, and the most remarkable domestic occurrences during that period.* To which was added, *An impartial History of the late Rebellion, interspersed with Characters and Memoirs, and illustrated with Notes.* For this work, which was by no means despicably executed, his necessity obliged him to accept the trifling compensation of half-a-guinea a week. About this time he lost his wife, who is described by Cibber as one of the most profligate and abandoned of women; yet, in a letter to a friend, he affectionately laments her death. After his return from Reading, his behaviour became more decent than formerly, and hopes were entertained of his reformation. The liberality of some of his friends had furnished him with a new suit of clothes, and he appeared to pay some regard to his character. He was employed in translating Fennel's Discourse on the existence of Deity, when he fell into a lingering illness, which terminated in his death. During this illness, he had the satisfaction to observe his principal poem, entitled *The Deity*, recommended by Fielding and Hervey; the latter of whom, touched by the story of his misfortunes, deposited two guineas with a friend, to be given to him as his necessities required. For this favour, he expressed his gratitude in a letter to Hervey, in which are strongly marked the humility and contrition of a chastised and penitent transgressor. His whole life, indeed, had been a kind of conflict between his depraved inclinations and those religious principles, which, in his early youth, had been impressed on his mind so deeply as never to be effaced. The remorse which he felt towards the close of life, from the remembrance of his former profligacy, is finely descri-

bed in his interesting poem, entitled *The recantation*. Perhaps the return of these better feelings may be ascribed, in a great measure, to a second matrimonial connection, which he formed, after returning from Reading, with a woman of low condition, but respectable for her prudence and virtue. Under her care, his character and circumstances were just beginning to improve, when he died, in the 51st year of his age, in such poverty as to be buried at the expense of the parish. We have been led into this detailed account of the life of Boyse, not so much from his claim to our estimation as a poet, as from the striking lesson which his history affords,—that no powers of genius will save the victim of indolence and imprudence from merited indigence and disgrace. “The relation,” to use the language of Dr. Johnson on a similar occasion, “will not be wholly without its use, if it remind those, who, in confidence of superior capacities or attainments, disregard the common maxims of life, that nothing can supply the want of prudence; and that negligence and irregularity, long continued, will make knowledge useless, art ridiculous, and genius contemptible.”

The poems which Boyse wrote for magazines and other periodical works are extremely numerous; but, from the haste in which most of them were produced, are scarcely worth collecting. His principal poems are, “The Deity,” “The Vision of Patience,” “Ode to Mr. William Cuming,” “An imitation of Horace and Lydia,” “An Epistle to Henry Brooke, Esq.” “A Recantation,” and “Albion’s Triumph.” All of these, except Recantation, and Albion’s Triumph, are to be found in Dr. Anderson’s Collection of the Poets of Great Britain. Nor were the genius or acquisition of Boyse confined to poetry alone. He had likewise a taste for painting, music, and heraldry, with the latter of which he was well acquainted. Had the talents which he naturally possessed, instead of being shrouded in indolence, or prostituted to vices, been employed according to the dictates of reason and virtue, he might have risen to eminence and respectability, and have escaped the almost unparalleled miseries which marked every period of his literary career. (k)

BRABANT, formerly a duchy, and one of the provinces of the Catholic Netherlands, now forming three departments of the French empire, is bounded on the north by Holland and Guelderland, on the east by Guelderland and Liege, on the south by Namur and Hainault, and by Flanders and Zealand on the west. It was originally divided into four quarters, viz. Louvain, Brussels, Antwerp, and Bois-le-duc. Its circumference is estimated at 80 French miles, and it contains 28 walled towns, with about 700 villages. It is watered by several considerable rivers and tributary streams, the principal of which are the Meuse, the Scheldt, the Dyle, the Demes, the Nethe, and the Aa. The Demes, after receiving the waters of the Ghete, the Dyle, the Senne, and the Nethe, takes the name of Rupel, and discharges itself into the Scheldt. It has also two canals, one near Brussels, which reaches from the Senne to the village of Willebroeck, near which it communicates with the Rupel; and the other joins the Rupel with the city of Louvain.

Brabant has always held the pre-eminence among the provinces of the Low Countries. It was anciently the seat of government, and the residence of the sovereign; and when the general assembly of the states was convoked, the first place and voice belonging to the deputies of Brabant. This province was the original residence of the family of Charlemagne, and was first erected into a duchy by that monarch in the beginning of the 9th century. It continued to be governed, as a separate state, by princes of his family until 1003, when it devolved to Lambert II. Count of Louvain, by his marriage with Gerberge, the sister and heiress of Otto, the last Duke of Brabant. After remaining three centuries in the house of Louvain, it descended by the female line to the dukes of Burgundy, and when united to the other possessions of these princes, formed one of the richest domains in Europe. Under the government of Philip the Good, Brabant soon rose to opulence and distinction: and had it not been drained of its wealth by the ambitious designs of Charles the Bold and his successors, in their wars against Switzerland and France, it might have continued, for a long time, the most opulent country of Christendom. Its fairs were crowded with merchants from every nation, and its manufactures of woollen and linen cloths were in great demand over all Europe. The shout of the Brabanders in the day of battle gave to their sovereign the title of *the rich Duke*; and Philip de Commines likened the prosperity of this country to the plenty of the land of promise. About the end of the fifteenth century, the sovereignty of Brabant, with the other provinces of the Netherlands, was transferred to the house of Austria, by the marriage of Mary of Burgundy with the Archduke Maximilian. But neither its privileges nor prosperity were affected by the change. The same love of liberty and spirit of industry actuated its inhabitants; and it continued to equal, if not surpass, its ancient grandeur under the Dukes of Burgundy. Antwerp had become the great magazine of the northern nations. The Scheldt was covered with numerous fleets, that kept their course to this celebrated port; and, according to Guicciardini, a writer of that age, Antwerp, where all languages were spoken, seemed to be the common city of all nations. But upon the abdication of Charles V. when Brabant came into the possession of Philip II. its disasters and fall commenced. After having deluged it with blood, and despoiled it of those privileges which so many princes had respected, he reduced it to the most degraded state, by civil and religious despotism. Under his successors, commerce and the arts rapidly declined. Its deserted cities shewed only, in their wide extent, the remains of their former prosperity; and the people, dispirited by oppression, scarcely retained the semblance of their ancient greatness. The numerous branches of the Scheldt were seized by Holland, who now, triumphant in war, extorted this humiliating concession from the weakness of Spain, that Antwerp, whose competition she dreaded, should hold no communication with the ocean by the navigation of that river. The commerce of this city, languishing before, was now extinguished. Her exchange was forsaken, her warehouses were empty; and the Scheldt wafted no ves-

sels to her port, but small trading barks from the rivers and canals of Holland. In the 17th century, the United Provinces took possession of the northern part of this duchy, which they called Dutch Brabant, and which formed an eighth state of the republic; and after the battle of Ramillies, in 1706, the remaining part was ceded by Spain to the house of Austria in the treaty of Utrecht. During the last century, under the auspices of the Austrian emperors, a commercial spirit began to revive, and an attempt was made to animate this and the neighbouring provinces, by opening a trade to the East Indies; but the Brabanders have never been able to rise from their degradation. Their name has seldom been mentioned among the nations, except when, like absolute property, they were transferred from one princely family to another; and though the insurrections occasioned by the arbitrary, but wise, measures of the emperor Joseph II. promised them liberty and independence, yet, by the revolution in which they terminated, they fell into the more intolerable despotism of an absolute aristocracy. When the French passed the Rhine in the revolutionary war, they established themselves in this country; and by the treaty of Campo Formio in 1797, and that of Luneville in 1801, Austrian Brabant was ceded to France, when it was formed into the departments of the Deux Netes, and the Dyle; and since the annexation of Holland to the French Empire, Dutch Brabant has been converted into the department of the Scheldt.

The inhabitants of this province, though now lost to all sense of political independence, yet possess many good qualities. They are remarkably phlegmatic, but humane, good natured, and friendly; and, even amidst the violence of passion, they are neither cruel nor implacable. But however insensible to their present degradation, this people once possessed high notions of liberty, and enjoyed, under their first princes, personal freedom and security beyond any other state in Europe. Even so early as the 9th century, the constitution of Brabant affords an example of civil liberty, which is scarcely surpassed at this day by any nation in the world. The *Blyde Inkomste van Brabant*, the joyous entry of Brabant, which was the great charter of their freedom, was so named, because the sovereign, when he entered upon his government, bound himself by an oath to govern according to this charter. In it the conditions are declared, on which the people consented to yield obedience, and on which the prince was willing to reign; and a remarkable clause is added, that if the sovereign should infringe any article of the Joyous Entry, his subjects should be released from all duty and service, until due reparation should be made. By this instrument, no arbitrary mandate could deprive a citizen of his liberty; his dwelling was sacred, and if suspected of a crime, the officers of justice could not enter his house unless two magistrates were present. If apprehended, he had a right, after a limited time, to call upon his judges to determine whether there were sufficient grounds for his detention. Without the consent and authority of the states, (which consisted of three orders, the clergy, the nobles, and the commons,) no taxes could be imposed,

or subsidies granted, and in the latter case the commons could not agree, until they collected the sense of their constituents in the different cities which they represented. The dukes of Brabant and Burgundy, and in later times the princes of Austria, governed according to this charter. But, in addition to the many privileges which the Brabanders enjoyed, by a decree of the emperor's, called the *Golden Bull of Brabant*, it was forbidden to all the princes of the empire, within or without their dominions, to exercise any jurisdiction over the natives of Brabant, unless justice should be denied by their own sovereign. Their personal liberty was equalled by their ingenuity and industry; and while the neighbouring nations knew no other business but that of war, the inhabitants of Brabant were trained to the diligence of trades and crafts. The woollen manufacture, in particular, was held in very great esteem. It gave occupation to vast multitudes, and brought great wealth into the country. But while commerce and the arts flourished here, at a very early period, beyond those of any other country, agriculture was not forgotten, and while these were precipitated in the fall of its independence, this last still retains its vigour. Swelling into hills of a gentle ascent, and covered with rich country seats, woods and lakes, inclosed grounds, and champaign fields, Brabant presents a beautifully diversified appearance, and in the greatest part of its extent is both populous and fertile. Every species of agriculture which is common to the country is in as high perfection as in England, and the best parts of England are even sometimes surpassed. It produces, in great abundance, rye, barley, oats, buck-wheat, potatoes, carrots, turnips, and a species of grass called *sporée*, which is cultivated in no other country except in Guelders and Cleves, and of which they make most excellent hay. Brabant is still famous for its drabs, and other woollen stuffs, as also for its camblets, carpets, and lace. See Shaw's *Sketches of the History of the Netherlands*. Holcroft's *Travels from Hamburgh to Paris*. Foster's *Travels*. Peuchet's *Dictionnaire Universel*. See also NETHERLANDS. (h)

BRABEJUM, a genus of Plants of the class Polygamia, and order Monœcia. See BOTANY, page 345. (w)

BRACCIOLINI, Poggio, a celebrated restorer of literature in the fifteenth century, was born in the year 1380, at Terra Nuova, a small town in the territory of the republic of Florence. From his father, Guccio Bracciolini, he inherited no advantages of rank or fortune; but for those literary attainments, in which he afterwards became so eminent, the circumstances of his birth were peculiarly favourable. The writings of Petrarca and Boccaccio were now read with avidity; and the zeal of these great men for the revival of literature had kindled throughout Italy an ardent spirit of emulation. The city of Florence was particularly distinguished by the enthusiasm, with which its principal inhabitants cultivated and patronised the liberal arts. It became, of course, the favourite resort of the most learned men of the time; some of whom were induced, by considerable salaries and rewards, to undertake the task of

public instruction. Among other eminent scholars, whom these advantages attracted to Florence, were Giovanni Malpaghino, better known by the name of John of Ravenna; and Manuel Crysoloras, who had been deputed by Palæologus, emperor of the East, to solicit the assistance of several European states against the growing power of the Turks; but who, tired of a commission so troublesome and unprofitable, had exchanged the office of ambassador for the humbler occupation of reading lectures on the Grecian classics. Poggio studied, under Malpaghino, the admired productions of ancient Rome. Crysoloras was his preceptor in the Grecian language;—that divine language, which, as Mr Gibbon finely expresses it, “gives a soul to the objects of sense, and a body to the abstractions of philosophy.” The literary fame, which Poggio afterwards acquired, is the best proof of the proficiency which he made under these celebrated masters.

After completing his studies, he repaired to Rome, probably about the year 1402, and was introduced to the notice of Boniface IX., who appointed him writer of the apostolic letters. He was then about 22 years of age; of a lively fancy, and an ardent constitution. The scantiness of his revenue, however, preserved him from the dissipation and licentiousness which prevailed at the Roman court; and his leisure hours were either devoted to study, or spent in the company of learned men, from whose conversation he could derive improvement and delight. He was soon deprived of the patronage of Boniface, who died about two years after Poggio's arrival in Rome; but was fortunate enough to procure the favour of Innocent VII., who succeeded Boniface on the Papal throne. The most gratifying fruit of his influence with Innocent was, the opportunity of advancing the fortune of his friend Leonardo Aretino, whom he introduced to the notice of the pope, and whose abilities obtained for him, in defiance of competition, the dignity of apostolic scribe.

During the violent dissensions which followed the death of Innocent, Poggio removed from the scene of contention, to enjoy, at Florence, the society of his literary friends. On this occasion he was honoured with particular regard by Nicolo Niccoli, an eminent scholar, and a distinguished patron of literature. Notwithstanding his retreat from the pontifical palace, Poggio still seems to have retained his office in the chancery, and continued to act as apostolical scribe, both to Alexander V., and to his successor John XXII. The death of Manuel Crysoloras, who was a member of the council of Constance, called forth a warm funeral panegyric from his accomplished pupil, who likewise perpetuated his praises in an appropriate Latin epitaph.

When John was deposed by the council, and his household was of course dispersed, Poggio remained at Constance, with the view of embracing any opportunity that might occur, of promoting his own interest, or that of his friend Leonardo Aretino. The mortifications which all the adherents of John experienced in Germany rendered him extremely dissatisfied with his situation, and seem even to have relaxed the vigour of his mind. Literary pursuits ceased to afford him amusement, and for a time his

studies were totally suspended. From this uneasy and listless state of mind, he sought relief in an excursion to the baths of Baden; his description of which, in a letter to Niccolo Niccoli, exhibits a most interesting picture of what a fashionable watering place was in the fifteenth century. Soon after his return to Constance, he witnessed the trial and execution of Jerome of Prague, which he describes with a degree of feeling, highly creditable to his candour and humanity. So deep was the interest which he felt and expressed for this great, unfortunate man, that his friend Leonardo became concerned for his safety, and advised him to speak and write more guardedly on that subject in future.

Poggio employed the leisure given him by the vacancy of the pontifical chair, in an expedition of the highest importance to the interests of literature. He had received information that many ancient manuscripts of classic authors were scattered in various monasteries, and other repositories, in the vicinity of Constance; and determined to rescue them from the hands of their ignorant possessors, who allowed them to remain buried in obscurity. In a visit to the convent of St Gallo, he had the happiness to discover a complete copy of Quintilian's works, which had hitherto appeared in a mutilated and imperfect state. He found, at the same time, the three first books, and part of the fourth, of the Argonautics of Valerius Flaccus, and Asconius Pedeanus's comment on eight of Cicero's orations. “Some ideas,” says Mr Roscoe, “may be formed of the critical state of these works, from the account that Poggio has left. Buried in the obscurity of a dark and lonely tower, covered with filth and rubbish, their destruction seemed inevitable.” Of this happy discovery, Poggio gave immediate notice to his friend Leonardo Aretino, who, in a highly flattering letter, full of the most extravagant expressions of joy, admonishes him to proceed with fresh diligence in his researches. In a monastery of the monks of Clugny, in the town of Langres, he found a copy of Cicero's oration for Cæcina, which he transcribed for the use of his Italian friends. In the course of subsequent journies through France and Germany, he discovered several other orations of Cicero, the loss of which had long been deplored by the learned. These orations were *De Lege Agraria contra Rulum liber primus—ejusdem liber secundus; Contra legem Agrariam ad populum; In L. Pisonem*. To a copy of these orations, preserved in the abbey of Santa Maria, at Florence, is affixed a memorandum, which records the fact of their having been discovered by Poggio. This memorandum, indeed, makes mention of seven orations which he had found in his researches; and, in the catalogue prefixed to the manuscript, besides the works already mentioned, he is allowed the credit of discovering the oration *pro C. Rabirio Pisone; pro C. Rabirio perduellionis reo; and pro Roscio Comedo*. At that time only eight of the comedies of Plautus were known to the classical student. The first complete copy of that author was brought to light by Nicholas of Treves, whom Poggio employed to continue the researches in the German monasteries. It was purchased from Nicholas by the cardinal Giordano Orsini, who refused to per-

mit Poggio, or indeed any of the literati, to transcribe it. On the warm interference of Loronze de Medici, the cardinal was, at length, induced to entrust the volume to Niccolo Niccoli, who, after copying it, returned it to the cardinal, and thus it came into the general possession of the learned. In the archives of the monastery of Monte Passino, Poggio found a copy of *Julius Frontinus de Aquæductis*, and eight books of a treatise on the mathematics, by Firmicus. From Cologne, he procured the fifteenth book of *Petronius Arbitræ*, a small fragment of which he had before discovered in Britain. With the assistance of Bartolomeo de Montepulciano, he discovered the exquisite poem of Lucretius, the poem of Silius Italicus, Lactantius's treatise, *De Ira Dei, et Opificio hominis*, Vegetius *De Re Militari*; Nonius Marcellus, Ammianus Marcellinus, and Tertullian. To his sagacity and diligence in these important researches, we owe likewise the entire works of Columella, the preservation of Calpurnius's *Bucolic*, and the recovery of the works of Manilius, Lucius Septimius, Caper, Eutychius, and Probus.

Poggio remained for some time at Constance, in expectation of preferment in the Roman chancery. It does not appear that he was employed by the new pontiff, Martin V., though he travelled in his suit to Mantua. Here he quitted the Roman court, probably in disgust, with a determination to spend some time in England, whither he had been invited by Beaufort, bishop of Winchester. The coldness of that prelate, however, and the savage manners of the inhabitants, then sunk in the grossest barbarism, rendered him extremely dissatisfied with his situation, and impatient to return to his native land. While thus chagrined with disappointment, he received an invitation to become secretary to the Roman pontiff, an office which the unpleasantness of his situation in England induced him, though somewhat reluctantly, to accept. For some time after his return to Rome, the pontifical court was agitated and alarmed by home dissensions, and foreign wars. An interval of peace at length succeeded, which Poggio employed in the assiduous prosecution of his studies. His first literary production, entitled *A Dialogue on Avarice*, appeared in 1429, and met with considerable approbation. The severe censures, however, which it contained against a new order of Franciscan friars, called *Fratres Observantia*, who were as popular with the vulgar for their empty and wild harangues, as they were despised and hated by all sensible people for their ignorance and their vices, provoked the keen indignation of the fraternity. Poggio was not to be daunted by their menaces, or silenced by their expostulations. He retained, to his latest breath, his detestation of these knavish impostors; and in a *Dialogue on Hypocrisy*, published when he had declined far into the vale of years, he again attacks them with the most sarcastic wit, and with the shrewdest observations on the human character. The freedom with which he censures the vices, not of individuals merely, but of whole classes of religious hypocrites, indicates a boldness of spirit, and a warmth of virtuous feeling, in the highest degree creditable to his character. It is on account of this freedom, that the Italian editors of his works have suppressed the Dialogue on

Hypocrisy, which Protestants have preserved and circulated with industrious zeal.

Soon after Eugenius IV. succeeded to the papal throne, a contest took place between him and the council of Basil, during the whole progress of which Poggio continued firm to the interests of the pontiff. The contest terminated in the deposition of Eugenius, and his flight to Florence; and Poggio, in attempting to accompany him, fell into the hands of his enemies, who detained him for a considerable time in captivity. Finding the exertions of his friends insufficient to procure his release, he, at length, purchased his freedom by a ransom, which the narrowness of his circumstances rendered extremely oppressive; and immediately on his enlargement he continued his route to Florence. On his arrival in that city, he found it agitated by violent factions. Cosmo de Medicis, who was the idol and the patron of the people, had been banished by the aristocracy; and the literati, according to their views and connections, espoused the quarrels of the different parties, and waged against each other a war of rancorous invective. One of the most violent of these literary combatants was Filelfo, an avowed enemy of the house of Medicis. Poggio, who had always been warmly patronised by Cosmo, grappled with this fierce adversary, and the contest was long maintained, not with the refined and pointed satire which might have been expected from men of ingenuity and learning, but by the forging of atrocious falsehoods and calumnies, equally disgraceful to themselves and to their cause. Poggio, tired at length of the bustle and contention of public life, determined to spend the rest of his days in retirement; and, with this view, purchased a villa in the pleasant district of Valdarno in Tuscany. The Tuscan government, as a mark of respect to so distinguished a character, who enjoyed no opportunities of amassing much wealth, passed a public act, exempting him and his family from the payment of all public taxes. To compensate for the want of magnificence, Poggio was anxious to dignify his humble mansion, by the taste displayed in its decorations. His library was particularly valuable; and he had a small but exquisite collection of statues, disposed in such a manner, as to constitute a principal ornament of his garden, and the appropriate furniture of an apartment, which he intended to dedicate to literary conversations. An enthusiastic admiration of ancient sculpture had prompted him to search out its relics with no less ardour, than he displayed in rescuing from obscurity the precious remains of Greek and Roman literature. He had diligently surveyed the ruins of ancient Rome; and has inserted, in the preface to his dialogue *De Varietate Fortunæ*, a catalogue of the relics of Roman Architecture, which Mr Gibbon has thought worthy of being introduced into his *Decline and Fall of the Roman Empire*. Nor were his researches confined to the precincts of Rome. Crypta, Ferrata, Tusculum, Ferentinum, Alba, Arpinum, Alatrium, and Tiburtum, were ransacked by him for the recovery of monuments of ancient sculpture; and by means of friends, his inquiries were extended to the various countries of Greece. While engaged in these researches, he was requested by a friend to give his opinion whether Cæsar or

Scipio Africanus were the greater man. In compliance with this request, he drew up an elaborate comparison between these two eminent men, and gave his decision in favour of Scipio.

He had not lived long in retirement, when he formed a matrimonial connection with a Tuscan young lady, of the name of Vaggia; a step, which, however proper or commendable it might otherwise have been, the circumstances in which he was then situated, rendered highly disgraceful. His treatise on the important question, *An seni sit uxor ducenda*, might satisfy his friends of the propriety of marrying, at the age of fifty-five, a young woman, who had not yet seen eighteen summers. But we cannot conjecture what arguments could justify him in paving the way for such a marriage, by dismissing a woman who had borne him twelve sons and two daughters, four of which children were still alive, and who were thus deprived of an inheritance, which he had secured to them by a bill of legitimation, and doomed to all the hardships of penury and disgrace. Yet, if we may credit his own assertions, the forlorn situation, into which he plunged the objects of his former attachment, occasioned him but little remorse, and he enjoyed, with his young consort, a happiness unalloyed by the disparity of their years.

The literary reputation of Poggio was now completely established, and widely diffused. His works were eagerly sought after; and several eminent scholars, who had been gratified by the perusal of some of his letters, requested him to prepare a collection of them for publication. The request was too gratifying to be resisted. A volume of his epistles was soon submitted to the inspection of the public; a copy of which is still preserved among the manuscripts of the Riccardi library at Florence. This volume had scarcely been prepared for publication, when he experienced a severe loss in the death of Niccolò Niccoli, to whom most of the letters it contains had been addressed. Poggio paid the last tribute of gratitude to his earliest and steadiest friend, in a funeral oration, replete with the eloquence and pathos of true affection.

Amidst the duties and the cares of domestic life, Poggio still found leisure to cultivate his favourite studies. In 1440 he published a *Dialogue on Nobility*, a work which greatly increased his reputation, by its clear arrangement, its elegant diction, and the abundance of classical allusions and references with which it is enriched. This dialogue was soon followed by another, *On the unhappiness of Princes*; in which, says his biographer Shepherd, "Poggio dwells with so much energy on the vices of exalted rank, that it may reasonably be suspected, that resentment and indignation had at least as much influence in its composition, as the suggestions of philosophy. His literary spleen is discernible in the sarcastic observations which he introduces, on the indifference with which the rulers of Italy regarded his researches after the lost works of the writers of antiquity; in the detail which he gives of the neglect and scorn which Dante, Petrarch, and Boccaccio, experienced from the great men of their times; and, in the general observations which he makes upon the contempt with

which mighty potentates too frequently regard the labours of the learned. The effusions of moroseness, which occur in this dialogue, are however interspersed with precepts of sound morality, and the historic details with which it abounds, are at once entertaining and instructive."

The prudence, or the merits, of Poggio had enabled him to retain his office as secretary, under seven successive pontiffs; yet he had never been promoted to any of the superior departments in the Roman chancery. But when Tommalo de Sarzano, his particular friend, ascended the pontifical chair, with the name of Nicholas V. new prospects of promotion opened upon him; and, in a congratulatory oration which he addressed to his friend on his preferment, he took care to remind him, that it would be the greatest glory of his pontificate to become the patron of men of genius, and that he himself, with whom he was connected by a similarity of studies, and who had become a veteran in the service of the Roman court, had a peculiar title to expect from his munificence the means of an honourable retirement. His hopes were more than realized by the generosity of Nicholas, who enriched him by liberal presents, and seemed to take pleasure in distinguishing him by peculiar marks of regard. The elation of prosperity appeared to give new energy to the mind of Poggio, and to inspire him with fresh ardour in the prosecution of his studies. These happy effects of his change of fortune, were soon displayed in his *Dialogue on the vicissitudes of Fortune*, which, for sublime philosophical maxims, illustrated by a detail of striking historical events, is by far the most interesting of his compositions, and may well challenge a comparison with any production of the age in which he lived. This dialogue was introduced with a dedicatory epistle to his new patron; and, as a fresh proof of his confidence in that enlightened and liberal pontiff, he soon after published his *Dialogue on Hypocrisy*, already mentioned; the boldness of which, in lashing the vices and follies of the clergy, had it appeared in the time of Eugenius, would probably have cost him his life. His talent for satire was again exerted, at the request of Nicholas, in an invective against Amadæus of Savoy, who, under the title of Felix, persisted in arrogating the honours of the pontificate. Nicholas soon assigned him the more honourable task of translating into Latin the works of Diodorus Siculus, and the *Cyropædia* of Xenophon. The plague, which raged in various parts of Italy, during the celebration of the jubilee in 1450, dispersed the members of the pontifical court, and, during this period of danger, Poggio paid a visit to his native place. It was on this occasion he published his *Facetie*, a work which, though the general dulness and indelicacy of its jokes be relieved by some lively sallies and entertaining anecdotes, is as unworthy of the talents of Poggio, as it is discreditable to the taste and the principles of the officers of the Roman chancery, whose "pointed jests and humorous stories" are registered in the *Facetie*. In 1451, he published his *Historia disceptativa Convivalis*, with a dedication to Cardinal Prospero Colonna. In this work he institutes a comparison between the professions of medi-

cine and civil law, both of which he holds up to ridicule.

In the April of 1453, the death of Carlo Aretino produced a vacancy in the chancellorship of the Tuscan republic, to which Poggio was elected by the unanimous suffrage of his fellow-citizens. He accordingly quitted the Roman chancery, in which, for fifty-one years, he had held situations of confidence and dignity, and removed his family to the Tuscan capital, where he applied himself, with uncommon assiduity, to the duties of his new office. As an additional proof of the esteem of his countrymen, he was elected, soon after his arrival in Florence, one of the *Priori degli arti*, or presidents of the trading companies; associations similar to those into which the citizens of London are at present subdivided. Neither his advanced age, nor the dignity of his exalted station, could raise the mind of Poggio above that tendency to low and indecent abuse, which had already thrown so deep a shade over the splendour of his talents and his learning. At the time of his removal from Rome, he was engaged in a violent quarrel with Lorenzo Valla, a scholar of distinguished eminence. A young Catalonian nobleman, who had been Valla's pupil, happened to possess a copy of Poggio's epistles. Having got this book, by some means, into his hands, he found on its margin several animadversions on alleged barbarisms in his style. Taking it for granted that Valla must have been the author of these animadversions, he immediately resented the fancied insult in a fierce invective. This attack Valla endeavoured to repel by an equally violent philippic, which he addressed to Nicholas V. under the title of *Antidotus in Poggium*. Poggio replied, and the contest was carried on for some time, on both sides, with all the coarse weapons of falsehood and vulgarity. This disgraceful quarrel, however, did not so completely occupy the mind of Poggio, as to prevent him from devoting a considerable portion of his time to studies of a more agreeable and useful nature. Soon after his final establishment in Florence, he published a dialogue, *De miseria humanæ conditionis*; which was immediately followed by his version of Lucian's *Ass*, his object in publishing which was, to establish a point of literary history till then unknown, that Apuleius was indebted to Lucian for the idea of his *Asinus Aureus*. His last literary work was his *History of Florence*, divided into eight books, and comprehending the transactions of the Florentines, from the year 1350, to the peace of Naples in 1455. His son Jacopo translated this history into Italian, and the translation almost superseded the original, till it was republished in a splendid form by Recanati, and afterwards found a place in the magnificent historical collections of Grævius and Muratori. He had not given the last polish to this valuable work, when death terminated his labours on the 30th of October 1459. The Florentines testified their respect for his memory, by having his portrait hung up in their public hall, and by erecting his statue on the front of the church of Santa Maria del Fiore.

The character of Poggio, though clouded with considerable stains, is upon the whole respectable and amiable. His violent quarrels with some of his literary

contemporaries evince a heart susceptible of keen resentment, yet it was equally susceptible of the more generous feelings of warm and enthusiastic attachment; nor did any spirit of jealousy ever prevent him from proclaiming the merits of his literary friends. The politeness of his manner, the extent of his information, the strength of his judgment, and the playfulness of his fancy, rendered his conversation extremely engaging; and his company was courted by the most distinguished of his countrymen. For the laxity of his morals, and the licentiousness of his conduct, it is but a poor apology, that, in the general depravity of the age, his vices attracted little notice, and gave little offence. His literary accomplishments entitle him to distinguished praise. In the Greek language he acquired considerable proficiency, and with all the Roman classics he was intimately conversant. His Latin composition, though not entirely free from barbarisms, is flowing and graceful; and, when compared with the works of the preceding age, its purity is truly astonishing. See Shepherd's *Life of Poggio*. (μ)

BRACELET, (*Brachiale*, *Braceletum*, Lat. *Bracelet*, Fr.), an ornament worn round the wrist. This ornament was worn at first as the badge of royalty. It was afterwards used by persons of inferior power, till it at last became a decoration for all ranks. (j)

BRACHMANS, BRAMINS, or BRAHMINS, called *Brāhmanas*, by the Greeks, constitute the first of the Hindoo casts. The Hindoos have, from all antiquity, been divided into four great tribes, or casts, which do not intermarry, eat, drink, or associate with each other, except when they worship at the great temple of Juggernaut, in Orissa, where they reckon it a crime to make any distinction. The lowest of these casts is that of the Soodra, who, in allusion to their degraded situation and menial occupations, are said to have been produced from the feet of Brimha, when he created the world. The next cast in the ascending scale is that of the Byse, consisting of merchants, bankers, and shopkeepers. They are called Banians, from their occupation, and being those with whom Europeans are chiefly conversant. This latter appellation was, by the early writers on Indian affairs, sometimes understood as applying to all who professed the Hindoo religion. The Byse were said to have been produced from the belly of Brimha, in allusion to the nourishment and provision which commerce diffuses through the state. The next in order of precedence is the Ketri tribe, or military cast. This may also be called the royal cast, for all their kings and rulers should belong to it. It was produced from the heart of Brimha, as indicative of the prudence and courage which should distinguish statesmen and soldiers. The highest of all the casts is that of the Bramins, who were said to have been produced from the head of Brimha, to vindicate their superiority over all the other tribes.

Like the Levites amongst the Jews, the Bramins alone can officiate in the priesthood; and the judgments denounced by the Mosaic law, against intruders into the sacred office, are not more terrible than those which the Bramins fulminate against any one, who may seem to invade the privileges of their order. They alone have permission to read the Ve-

das, or sacred books, containing the mysteries of their philosophy and religion. The Ketri, alone, have the distinguished honour of hearing (for they dare not read) these supposed oracles of wisdom: and if a Soodra were convicted of so much as hearing a passage from the Vedas or the Shasters, he would have boiling lead poured into his ears as a punishment for his presumption. It is curious thus to mark the congenial policy of priestcraft in every age, and to observe the analogy between oriental and western superstition. No object in nature is so sacred, in the estimation of a pious Hindoo, as the person of a Bramin: it is regarded as the greatest impiety to fail in the prescribed rules of respect and reverence; and to cause his death is an inexpiable crime. This inviolability of the Bramins has given rise to gross abuses, and has latterly called for the interference of the British legislature. When a Bramin supposes himself aggrieved, he has been known to take his mother, or his child, and, going into the presence of the person who has injured him, to stab them to the heart, unless he received immediate reparation. The person who has driven him to this extremity is henceforth considered as profane, and viewed by the superstitious multitude with horror and detestation. Sometimes the Bramin chooses to sit in Dhurna, as it is called; that is, he takes his station before the house of his enemy, and threatens to take away his own life if he offers to come out of his house before he has given him the satisfaction which he demands: and as the Bramin never takes such a step without a determination to persist in his resolution, and carry his threats into effect, the unfortunate prisoner is either obliged to submit to perhaps a lawless exaction, or to incur the insupportable odium of having occasioned a Bramin's death. The British government has had the courage to check this absurd practice; and wherever a Bramin is discovered sitting in Dhurna, he is seized, notwithstanding the inviolability of his person, and thrown into prison.

All the learning in India is in the hands of the Bramins; and they were so celebrated for their literary and philosophical attainments in ancient times, that many of the most famous of the Grecian sages travelled into India to perfect themselves in knowledge. However this may be, India does not appear to be the storehouse of knowledge in modern times, and few would visit it, unless they had the prospect of bringing home something else than wisdom. It perhaps would be going too far, to affirm, that we might as well look for the learning and refinements of ancient Egypt among the modern Copts and Manichæes, as expect the knowledge of the ancient Gymnosophists among the modern Bramins: but certainly we do not meet with any of their literary or scientific productions, which can in any degree command our respect; nay, even their most ancient and venerable records, to which some have been disposed to ascribe an almost unfathomable antiquity, are of very little worth in a literary point of view, consisting of a tissue of incomprehensible allegories, and extravagant fables, which no human sagacity can unravel.

Of their science, we have few or no remains, ex-

cept their astronomical tables and trigonometrical methods which have made so great a noise in Europe. Respecting their tables, we have already ventured to give our opinion, (see *ASTRONOMY*, p. 585,) and have claimed for them a high antiquity, upon grounds which we think will not easily be overturned. The Bramins cannot be allowed the credit of the observatory at Benares, as, according to the best accounts, it was erected by the celebrated Mahometan emperor Ackber. It is now pretty well ascertained, that the arithmetical characters now employed in Europe, are of Indian, and not of Arabian origin, as was long supposed. The only learning which seems to be held in any degree of estimation amongst the Bramins, in modern times, is metaphysical subtlety and argumentation. This, indeed, seems, to have been the species of crudition in which they have always delighted, as corresponding best with the indolence of their habits, and the acuteness of their genius. Accordingly, we find regular systems of logic and metaphysics, with all the niceties, distinctions, and classifications, which are to be found among the Grecian dialecticians; and it is doubtful whether Aristotle, the father of logic, did not derive both his materials and arrangement from India. A Mahometan historian, as quoted by Sir William Jones, records a curious anecdote corroborative of this conjecture. He mentions, that Callisthenes procured a regular treatise on logic, in the Panjab, and transmitted it to Aristotle; and perhaps curiosity may yet be gratified by discovering, that the Grecian philosopher did not invent, but translate and compile a system of dialectics. One thing is certain, that there is scarcely a notion which has been advanced by metaphysicians, in ancient or modern times, but may be found asserted and illustrated in some of the Braminical writings. We meet with materialists, atomists, pantheists, and intellectualists, if we may so denominate the followers of the subtle and ingenious system of Berkeley. There can be very little doubt that Pythagoras borrowed most of his mystical philosophy, his notions respecting the transmigration of the soul, and the unlawfulness of eating animal food, from the ancient Bramins; for we find all these things particularly explained and enforced by the modern Bramins. They still abstain from all kinds of animal food, except that in some provinces they eat a little fish, but so disguised with rice and condiments, as scarcely to be discerned. The most sacred of all their animals is the cow, and to touch its flesh in the way of food, is regarded as the highest pollution, and involves a forfeiture of cast, even in the case of those who have been involuntarily guilty of this offence. Hence the tyrant Tippoo forcibly converted a great many of his Hindoo subjects to the Mussulman religion, by sprinkling them with cow broth: by this means they were for ever rendered unclean in the eyes of their countrymen, and were glad to seek an asylum from reproach, by embracing Mahometanism.

This veneration for the cow, points out an evident connection between India and Egypt, in which latter country, it is well known that the cow was the principal object of religious adoration: nay, in the account which Bartolemeo gives of a certain Indian festival which he witnessed, we recognize all the

rites of Apis. We are at a loss, however, to know what conclusion we are to draw from this fact; and it must still be matter of conjecture, whether India has borrowed from Egypt, or Egypt from India; or whether both have not drawn from one common source.

The Bramins formerly made a great mystery of their tenets; and there was nothing that they shunned so much as communicating their dogmas in philosophy and religion to strangers. The celebrated Ackber, the wisest of all the princes who ruled the Mahometan empire in India, was extremely anxious to get acquainted with the doctrines of the Bramins: for this purpose, he made use of every argument which policy could suggest, to draw from them their hidden stores of knowledge: finding, however, all his efforts unavailing, he at last adopted the expedient of imposing on a celebrated Bramin, at Benares, a youth of the name of Feizi: this he accomplished by persuading the Bramin that Feizi belonged to the cast of Bramins. The youth was joyfully received, and instructed in all the mysteries of Sanscrit literature; when the time, however, approached, that he should depart, and communicate to Ackber the secrets which he had gained, he felt himself detained by a violent attachment to the Bramin's daughter: the ancient sage threw no obstructions in the way of their mutual passion; he even offered his daughter in marriage to Feizi. The young man thinking it ungenerous any longer to deceive his benefactor and instructor, fell down on his knees, and confessed the imposture which had been practised upon him. The Bramin, without uttering a word of reproach, drew a dagger, and was on the point of plunging it into his own breast, when Feizi prevented him, protesting that he would do whatever he required of him; upon this, the Bramin imposed a solemn oath, that he should never translate the Vedas, nor divulge the information which he had clandestinely obtained.

This jealousy with regard to the mysteries of their religion, as far as it is contained in their sacred books, is now completely at an end; and they may be explored by any one who has sufficient curiosity to impel him to the task, and sufficient learning to execute it successfully. But the most unfortunate circumstance in the business is, that, with all these facilities of information, the subject is still as mysterious as ever, and though curiosity has been highly gratified, we are as far as ever, from any facts that can lead to a certain or useful result.

It is pretty generally asserted, that no alteration has taken place in the Braminical system for many thousands of years; we, indeed, recognize many of the features described by Strabo and Arrian; but we find others as completely altered. It is no longer true, that the offices of the Bramins are confined to devotion, sacrificing, and philosophy. They engage in all the offices of civil life, and, in many cases, nothing appears so foreign to their habits as literature and philosophy. The Paishwa of the Mahrattas is a Bramin; his troops are composed principally of Bramins; and it has been remarked, that throughout his extensive territories, scarcely any thing is

safe from violence and rapacity, but a cow and a Bramin.

It is also universally admitted, that the modern Bramins are grossly ignorant and immoral. Nothing is more common in India, than to meet with a fellow infinitely inferior in point of intelligence to the rudest English clown, yet assuming all the grimaces of sanctity and wisdom, and exacting, as his due, a respect bordering on adoration. This is, indeed, the natural effect of the Braminical system; when a man is sure of honour and respect, independent of merit or exertion, as every Bramin is by his birth and character, it is not easy to see what can stimulate the mind to useful efforts: and it would be in vain to expect moral purity, where ignorance is methodized into a system, and where this order of men is raised, if not by law, at least by the superstition of their countrymen, beyond the reach of justice, and the fear of penal inflictions. Accordingly Mr Holwell, who stickles as keenly for the pretensions of the Bramins, as if he had been a convert to their faith, allows an observation to escape him near the close of his work, which completely oversets his preceding theory; for he admits, that there was scarcely a murder or a robbery committed in the country, but a Bramin was found to be at the bottom of it. He is careful, however, to observe, that he speaks only of the lowest and most ignorant race of Bramins, and that the higher and more learned orders are to be exempted from the charge. It would perhaps be unfair to include a whole order of men in the sweeping charge of ignorance and profligacy, but we have an unfortunate fact to state, which would lead us strongly to suspect the purity and honesty of any order of Bramins. A learned pundit at Benares, who had been engaged by captain Wilford to translate one of the Puranas, imposed on his employer, by the interpolation of the memorable story of Satyavrata and his three sons, corresponding exactly with the story of Noah. After captain Wilford had completely detected the trick, he sent for the pundit, to upbraid him, who swore, by all that was sacred, that it was no imposition; and in proof of his assertion, brought ten of the most celebrated pundits at Benares, who were ready to swear to the falsehood.

The Bramins, indeed, seem to have degenerated in every respect from their ancestors. Clemens of Alexandria quotes a passage from Megasthenes, a historian who lived in the time of Seleucus Nicator, in which he affirms, that the physical sciences among the Greeks were taught by the Bramins among the Indians. Indeed, the physical sciences amongst the Greeks and Indians seem to be much on a par, consisting entirely of absurd cosmogonies, and theories altogether unsupported by experiment. Eusebius, in his *Preparatio Evangelica*, l. 6. c. 10., states a fact very inconsistent with the present practice of the Bramins; he expressly affirms, that they worshipped no images: *χιλιades πολλαι των λεγομενων βραχμανων οιτινες, κατα παραδοσιν των προγονων και νομων, οτι φανεινται, οτι ζωντα σιβεωσι*. At present there are not grosser idolaters on the face of the earth, nor are the visible objects of adoration any where so absurd, and ob-

scene. It is true, indeed, that in the Vedas and Shasters the unity of God is often expressly asserted, and illustrated in very sublime and beautiful language: at the same time such a complicated machinery of inferior agents is employed, and the whole is so involved in allegory, that polytheism may be said to be taught in the Vedas themselves. This is the case with the purest systems of ancient mythology: whilst they admit the doctrine of a supreme God as the source of power, and the author of all existence, they uniformly admit the existence of subordinate deities, dependent on the supreme, and employed by him in the government of the universe. This opinion necessarily leads to polytheism: people will always be most ready to worship those deities with whom they consider themselves as most closely connected: and the supposed agents will be adored, as the most likely means of recommending them to the notice of the supreme divinity. In this way the worship of saints in the Roman church almost entirely superseded the worship of the Most High: and in the Indian mythology, Brimha, the chief deity, has not a temple erected to his service, whilst thousands of splendid pagodas are raised in honour of inferior gods.

It has sometimes been said, that religion is merely a political device, invented by statesmen, for the purpose of enforcing obedience to the laws. Without stopping to controvert an opinion which has been so often refuted, we merely observe, that the Braminical religion has evidently not had its foundation in the policy of princes: it is in all its parts a complete system of priestcraft: it claims for its ministers a dignity and respect far superior to that of kings; and the highest monarchs have been content to bow before them, and to acknowledge their pretensions. This circumstance sufficiently indicates the high antiquity of the order. It was only in the earliest times that the priestly office had such influence in society, as to be able to mould the government and manners of a state. In the remotest antiquity, we are informed, the same person was priest and king. The Braminical system is evidently an improvement on this plan; for by it, the framers have contrived to reserve to themselves the highest place in respect and dignity, whilst they have devolved the cares and business of government on an inferior order, which must act in all respects according to their directions. The great extent of Hindostan, and its remoteness from the scene of European politics and conquest, preserved this system unimpaired for perhaps several thousands of years. India remained almost entirely undisturbed by the inroads of conquerors, till the period of the Mahometan invasion. Alexander the Great scarcely made the slightest impression upon it, and we make no account of the fabulous exploits of Bacchus. But dreadful was the shock which it received from the Mussulman invaders: they swayed the sceptre, which, in their hands, was a rod of iron, over the greatest part of Hindostan, and they left no art unemployed, which bigotry, policy, or cruelty could devise, to establish Islamism on the ruins of the Braminical religion. By these means the Braminical institutions were considerably affected, and their influence has been still farther impaired by the inter-

course with European settlers: they still exhibit however, a gigantic system of superstition, whose overthrow is rather an object of distant hope, than of sanguine expectation.

See Maurice's *Ancient Hist. of Hindostan and Indian Antiquities* passim; *Asiatic Researches* passim, particularly the papers by Sir William Jones, Mr Colebrooke, and captain Wilford; *Universal History*, vol. vi.; *Phil. Trans.* No. 268, p. 729; Bartolomeo's *Voyage to India*; Bernier's *Travels*; Lord's *Religion of the Bramins*; Ayeen Akberry; *Institutes of Menu*, translated by Sir W. Jones. Dow's *Hindostan*, Preliminary Dissertation; Foster's *Travels*; Kendersley's *Hindoo Literature*; *Sketches of the Hindoos*, anonymous, but giving a very clear and satisfactory statement; *Edin. Phil. Trans.* vol. ii. p. 135; and *Edinburgh Review*, vol. x. p. 455, and vol. xii. p. 41. (g)

BRADFORD, from the Saxon *Bradenford*, or Broad ford, a considerable manufacturing town of England, in Wiltshire, beautifully situated on the declivity of a hill, on the Lower Avon, which divides it into two parts, the Old and New Town, and which is crossed by two stone bridges, one of nine arches and the other of four. The principal public buildings are the church, a free school for boys, and two charitable establishments for old men and women. About ten or twelve hundred pieces of fine broad cloth are manufactured here annually, and in one manufactory there are no fewer than 1500 persons employed. Number of houses in 1801, 1288. Population 7302, of whom 4648 are employed in trade and manufactures. (H)

BRADFORD, an ancient manufacturing town of England, in the West Riding of Yorkshire, situated on a rising ground, from which excellent stone for building is obtained. The chief public buildings are, the church, and the Piece Hall, in which various articles of manufacture are exhibited for sale. The principal manufactures of Bradford are worsted stuffs, shalloons, calimancoes, broad and narrow cloths, wool cards, combs, and leather boxes. There are three iron foundries in the town, and one in the neighbourhood, all of which are advantageously supplied with iron ore and coal. A cut from the Leeds and Liverpool canal conveys the manufactures of Bradford to the great marts of trade. Number of houses in 1801, 1368. Population 6393, of whom 1300 were employed in manufactures. (H)

BRADLEJA, a genus of plants of the class Monœcia, and order Monadelphia. See BOTANY, p. 322.

BRADLEY, JAMES, a celebrated astronomer, was born at Shireborn, in the county of Gloucester, in 1692. He received the first rudiments of his education at a boarding-school in North Leach, kept by Mr Egles and Mr Brice; and being intended by his parents for the church, he was sent to Oxford, and was admitted a commoner of Baliol College, on the 15th of March 1710-11. After having taken the degree of B. A. in 1714, and that of M. A. in 1717, he was admitted to deacon's orders by the bishop of London, on the 24th of May 1719, and a few months afterwards, he obtained priest's orders from the bishop of Hereford, who not only appointed him his chaplain, but presented him to the vicarage of Bridstow, in the county of Hereford. The fondness

which Bradley had already shewn for his favourite science, and the talents which he had already displayed in the pursuit of it, introduced him to the notice of the honourable Mr Molyneux, then secretary to the Prince of Wales, and distinguished for his successful cultivation of the sciences of optics and astronomy. This patron of learning was not satisfied with paying to our young astronomer that general and unsubstantial attention, which checks oftener than it invigorates the blossom of youthful genius. He saw that science could only be cultivated with success, when the mind was free from the anxieties of dependent circumstances, and he exerted himself, with zeal, in procuring for Bradley the sinecure rectory of Landowry Welfry, in Pembrokeshire, to which he was admitted in 1719.

The taste for astronomy, which Bradley had cherished from his earliest years, was encouraged by the instructions of his maternal uncle, the Rev. Dr. Pound, who is well known as an astronomical observer, and who resided at his living of Wanstead in Essex, where his nephew was for some time curate.

It was in this scientific retreat, during the intervals which he stole from his professional avocations, that our author commenced those astronomical observations which afterwards conducted him to some of the finest discoveries of which astronomy can boast; and though at this early period he exhibited no other merit but that of an accurate observer, he was honoured with the notice of the Lord Chancellor Macclesfield, Sir Isaac Newton, Dr Halley, and of many of the illustrious men who were at that time the ornaments of the Royal Society.

In consequence of the death of Dr Keill, he was appointed Savilian Professor of Astronomy in the university of Oxford, on the 31st October 1721; and thus had the felicity of being associated with the illustrious Dr Halley, who was at that time Savilian Professor of Geometry. In this new situation, Bradley seems to have abandoned all views of ecclesiastical preferment. He saw that his fame was now to depend on his astronomical labours, and perceiving that his progress would be retarded by the duties of a profession, which it would be sinful to neglect, he cheerfully resigned all his livings in the church, and bent the undivided vigour of his mind to the cultivation of his favourite science.

In the year 1724, he communicated to the Royal Society his observations on the comet of 1723; and in 1726, his observations on some eclipses of Jupiter's satellites were laid before the same learned body; but none of these papers were distinguished by any other merit but the accuracy with which the observations were made.

About the end of 1725, when on a visit to Mr. Molyneux at Kew, Mr. Bradley's attention was directed to the subject of the parallax of the fixed stars, by which he was led to his two brilliant discoveries of the aberration of the celestial bodies, and the nutation of the earth's axis. The theory of the aberration of the fixed stars, of which we have already given a very full account under the article *ABERRATION*, was published in the Transactions of the Royal Society for 1728, and extended the fame of Bradley, not only as an accurate observer, but as

a profound philosopher, over the whole of Europe.

In the year 1730, Mr Bradley was appointed to succeed Mr Whiteside as lecturer in astronomy and experimental philosophy in the university of Oxford, an office which he held during the remainder of his life; and in 1737 he published his observations on the comet which appeared at the beginning of that year. From the situation which our author held at Oxford, he was intimately acquainted with Dr Halley, who soon perceived and appreciated the excellence of his character, and the extent of his attainments. Worn out with the labours of study, and sensible that his health was rapidly declining, this veteran philosopher was solicitous that Dr Bradley should succeed him as astronomer royal at Greenwich, — a situation for which he was, above all others, so eminently qualified. He accordingly made frequent applications for the reversion of this office to his young friend, and even offered to resign it in his favour, if such a step were necessary to his success. Death, however, put an end to the friendly solicitations of this venerable man, before they had been crowned with success; but through the influence of the Earl of Macclesfield, the president of the Royal Society, Bradley was appointed to the office of astronomer royal in 1742; an appointment which the university of Oxford very properly distinguished, by conferring upon Bradley the degree of doctor in divinity.

In the year 1744, Dr Bradley married Mrs Susanah Peach, the daughter of Samuel Peach, Esq. of Chalford in Gloucestershire. The result of this marriage was only one daughter, who survived her father.

In the course of his observations on the declinations of the fixed stars, Dr Bradley was led, in 1745, to the discovery of the nutation of the earth's axis, of which he communicated a detailed account to the Royal Society, in 1747, in a letter addressed to the Earl of Macclesfield. In this admirable letter, which is equally remarkable for its philosophical precision, and for the simplicity and modesty with which it is written, Dr. Bradley takes an opportunity of expressing the obligations which he lay under to Mr. George Graham, by whom his instruments were principally made; and we cannot help contrasting his conduct, in this respect, with that of many modern mathematicians, who are too apt to overlook the high claim to reputation, which the makers of philosophical instruments most undoubtedly possess. "I am sensible," says Dr Bradley, "that if my own endeavours have, in any respect, been effectual to the advancement of astronomy, it has principally been owing to the advice and assistance given me by Mr George Graham, whose great skill and judgment in mechanics, joined with a complete and practical knowledge of the uses of astronomical instruments, enable him to contrive and execute them in the most perfect manner." The important discovery of the nutation of the earth's axis was rewarded with the gold medal, which was annually given by the Society.

From the numerous observations which Dr Bradley had now made, he became more and more sensible of the necessity of having instruments even more accurate than those which he had used; for, to use his own

words, "as we advance in the *means* of making more nice enquiries, *new* points generally offer themselves, that demand our attention." He therefore embraced the opportunity presented by the annual visit which the Royal Society made to the observatory, and he pointed out to the learned deputation from that body, the necessity both of repairing the old instruments, and of obtaining several new ones. In consequence of this representation, the Society obtained from George II. in 1748, a grant of 1000*l.*, to be expended on astronomical apparatus, under his superintendence. With the assistance of Mr George Graham and Mr John Bird, the observatory was soon furnished with those admirable instruments, by which all his subsequent observations were made.

In the year 1751, when the living of Greenwich became vacant, Mr Pelham offered it, in the king's name, to Dr Bradley, as a token of respect for his important services to science. The same conscientious motives, however, which induced him to resign his livings in the church, prompted him, on the present occasion, to decline an offer, which would have set at variance the duties which he owed to religion and science. The king was so much pleased with the disinterestedness of our author, that he granted him a pension of 250*l.* during pleasure, which was continued till the end of his reign, and renewed on the accession of his present majesty.

In 1752, Dr Bradley was admitted into the Council of the Royal Society; and in 1757, he published his observations on the comet of that year. The remainder of our author's life was not distinguished by any events which are worthy of being recorded. He continued to prosecute his observations, with a diligence too great for his constitution, till he was afflicted with a lowness of spirits of the most distressing kind: he was in constant terror of mental derangement, and though the vigour of his faculties suffered no abatement, yet the fear of losing them altogether never ceased to haunt him till the end of his life. In 1760, his bodily strength began to experience a decline, and in consequence of an inflammation of his kidneys, he was attacked with a total suppression of urine, which terminated his existence, at Chalford, in Gloucestershire, on the 13th of July, 1762, in the 70th year of his age. His remains were deposited at Mitchim Hampton, in Gloucestershire, in the same grave with his wife and mother.

The fame of Dr Bradley was widely extended during his life, and gained him the particular notice of most of the learned societies of Europe. The Academy of Sciences at Paris enrolled him among their number, in 1748. In 1754, he was elected a member of the Academy of Sciences at St Petersburg. In 1757, he was chosen a fellow of the Academy of Sciences at Boulogne; and he obtained the same honour from the Academy of Sciences at Berlin.

The private character of Dr Bradley was marked by all those virtues which are estimable in domestic society. He was mild and gentle in his temper, compassionate and liberal to the poor, and kind and generous to his relations. Though he spoke well, and expressed himself clearly, yet his silence was so proverbial, that he was said never to have spoken but when it was absolutely necessary. The attention and kindness which were shewn to him, from persons of

VOL. IV. PART I.

the first rank and talents in the kingdom, were not extorted by that bustling activity and self applause, with which some philosophers have attempted to force themselves too rapidly into public notice. Bradley was too modest for this species of philosophical empiricism, and too sure of fame to take the trouble of courting it.

The writings of our author were extremely few. A valuable paper of his, on Micrometers, was published in the Transactions of the Royal Society for 1772. His catalogue of 389 fixed stars appeared in the Nautical Almanack for 1773. His numerous and accurate observations on the moon led to the perfection of the lunar tables. He constructed, from his own observations, new tables for finding the places of Jupiter's satellites; and he determined, with great accuracy, the atmospherical refractions, and gave an elegant formula for computing the corrections due to a variation in the density and temperature of the air. His observations, which occupy no less than thirteen folio volumes, were presented to the university of Oxford in 1776, on condition that they should be printed. The first volume has been recently published by Dr Hornsby; but, in consequence of his ill health, the remainder are now in the hands of the learned Mr Abraham Robertson, to whom they have been entrusted for publication. (β)

BRADNINCH, a town of England, in Devonshire, situated on the river Collumb. It consists of one irregular street, about a mile long. The principal manufacture of the place is paper-making, which is carried on to a great extent in the neighbourhood. Number of houses 253. Population 1187. (j)

BRAGA, or BRAGUE, the *Bragara* and *Augusta Bracharorum* of the ancients, a city of Portugal, the capital of the province of Entre Douro e Minho, is situated in a broad open valley of the same name, on the small river Cavado. Braga is said to have been built by the Bracares, the ancient inhabitants of the country, and was ranked by Ausonius among the four chief cities of Spain.

Quæque maris sinu jactat se Braccara dives.

When Galicia and Portugal were invaded by the Suevi, Braga became the seat of their kings, and continued so for 170 years, when it was taken by the Goths. When Alphonso I. took this city from the Moors, in 1240, all the Spanish bishops submitted themselves to its church; and hence the archbishops of Braga stiled themselves the primates of Spain, an honour which was disputed with them by the prelates of Toledo. The ruins of an aqueduct, of an amphitheatre, and several Roman coins, evince the antiquity of the city.

"Braga," says that intelligent traveller, Mr Link, "is subject to the archbishop of the place, who enjoys a revenue of 100,000 crusades; and appoints judges and two tribunals, the one spiritual, the other temporal; so that this is the only city where the king does not appoint a corregidor, or a *juiz de fora*. In the coutos (*loca cauta*, or asylums or places where a priest has jurisdiction) round the town, his sentence is final in criminal affairs, but not on the inhabitants of the town.

"Braga contains five parishes, and seven monasteries. Several of the streets are broad, light, and

3 D

open, but most of the houses are small, as in all inland towns in Portugal. Among the objects of curiosity here is the large old Gothic built cathedral, with its antiquities and treasures; also the church and monastery of St Fructuosa, containing a miraculous picture of the virgin, and rich in treasures and relics, stand on a hill with the town, so situated as to form a fine object, as seen from a broad ancient street.

"Braga was a more considerable place in the 15th century than now. It has a hat manufactory, which supplies a great part of Portugal with hats for the common people, nor are the hats bad, though they do not equal the English. There is also a manufactory of knives, which is inconsiderable. The women are every where seen knitting, sewing, or making linen, and signs of industry and activity every where appear. The rich inhabitants of Braga have a bad name in the other very social towns of Minho. They are accused of being quarrelsome, fond of scandal, and their manners are very much disliked." Population 13,000. The diocese includes 1200 parishes, and 150 convents. W. Long. $8^{\circ} 5'$, N. Lat. $41^{\circ} 33'$. See Link's *Travels in Portugal*, p. 334. (π)

BRAGANTIA, a genus of plants of the class Gynandria, and order Hexandria. See BOTANY, p. 313 (ν)

BRAGANZA, *Berganca*, *Brigantia*, and *Brigentium* of the ancients, supposed by some to be the *Coeliobrigia* of the ancients, is a town of Portugal, in the province of Tralos Montes, situated in a spacious plain near the river Fervença, on the borders of Leon and Galicia. Braganza consists of a city, defended with towers and a castle, and a town under the protection of a fort. Two parish churches, two hospitals, and four convents, are the principal public buildings. Stuffs of silk, velvet, and program, are the only manufactures of the place. The Oyder of Braganza comprehends the city itself, and twelve other towns, and contains about 75,000 inhabitants. There were mines of silver in the Duchy. Population of the town, 2,700. W. Long. $6^{\circ} 25'$, N. Lat. $41^{\circ} 44'$. (o)

BRAHE, TYCHO, a celebrated astronomer, was born on the 14th December, 1546, at Knudstrop, a small lordship, near Helsingborg, in Schonen, and was descended from a noble Swedish family that had for some time been settled in Denmark. Blessed, or burdened, perhaps, with a large family, his father, Otto Brahe, was anxious to educate his sons at the least expense, and therefore chose for them the honourable and easy profession of a soldier. His son Tycho, however, had the good fortune to be adopted as the heir of his uncle, George Brahe, who, perceiving the capacity of his nephew, and his fondness for study, got him instructed in the Latin language, without the knowledge of his father.

At the age of twelve, after the death of Otto Brahe, his uncle sent Tycho to Copenhagen to complete his studies, preparatory to his entering upon the profession of the law. After he had spent two years at this university without exhibiting a predilection for any particular branch of knowledge, his passion for astronomy was excited by one of those accidental circumstances, to which science has so often been indebted

for her most able cultivators. The great eclipse of the sun on the 21st of August 1560 attracted his notice, and he was struck with astonishment, when he perceived that it happened at the precise time at which it was predicted. From that moment he determined to understand a science so correct in its principles, and he immediately purchased a copy of the *Tabula Bergenses* by Jo. Stadius, from which he acquired some information respecting the planetary motions.

After finishing his studies at Copenhagen, he was sent to Leipsic, to acquire a knowledge of the law: but the attractions of astronomy withdrew his attention from every other subject, unless when his tutor urged him, by his remonstrances, to prepare for the profession to which he was destined. The pocket money allowed him by his uncle was uniformly expended in the purchase of astronomical books; and with a little celestial globe, he studied the names of the stars, when sleep had disarmed the vigilance of his preceptor.

After remaining three years at Leipsic, he was preparing to make the tour of Germany; but, in consequence of his uncle's death, in 1565, he returned, to inherit the fortune which had been bequeathed to him. His relations seem to have seized this opportunity of making their last effort to subdue his love of science, and to bend his mind to the level of his profession. They loaded him with reproaches for having neglected his studies: and they treated his astronomical knowledge as useless, and even degrading, till his situation became so uncomfortable, that he left the country, with the design of travelling through Germany.

At the beginning of his travels, when Tycho had arrived only at Rostoch, an accident occurred, which had nearly terminated his career. At a wedding feast to which he was invited, he quarrelled with a Danish nobleman about some subject in geometry, and being both of impetuous dispositions, the mathematicians resolved to settle the difference in the field. In this duel Tycho lost a considerable portion of his nose, a loss which he very dexterously supplied with a substitute made of gold and silver, and fastened by means of glue, so as to resemble the real member.

During his visits to the principal cities of Germany and Italy, Tycho became acquainted with the most illustrious astronomers of the times, and neglected no opportunity of improving in his favourite study. Among these were the Landgrave of Hesse, one of the most accurate observers of his age, who contributed much to the future comfort of Tycho.

During his stay at Augsburgh, he formed an intimate acquaintance with the celebrated Peter Ramus, and he inspired with a love of astronomy Peter Hainzell, the consul or burgomaster of the city. This public-spirited magistrate built an excellent observatory at his own expence, under the direction of Tycho, in which they made many valuable observations before Tycho left Augsburgh. Hainzell continued to observe the heavens with great assiduity, and afterwards published his observations on the new star which appeared in 1572.

In 1570, Tycho returned to Copenhagen; but from the fame which he had already acquired, he was invited to court, and harassed with the visits and

attentions of his friends and admirers. To avoid the serious interruptions to his studies which he thus suffered, he retired to Herritzvold, near his native place, where his maternal uncle, Steno Bille, offered him every accommodation for the prosecution of his studies. In this sequestered spot, the mind of our astronomer was at that same time distracted with the study of alchemy and the passion of love; but he found it much more difficult to obtain the philosopher's stone, than the object of his affections. The young girl with whom he was so violently enamoured, was the daughter of a neighbouring peasant; and though he endeavoured, by several ingenious arguments to convince his relations, that the inferiority of her rank would make her a more suitable wife to a philosopher, yet his marriage produced an animosity among the parties, which nothing but the personal interference of the king was able to compose.

During Tycho's residence at Herritzvold, he discovered the new star in Cassiopeia, which appeared in 1572, and which was one of the most remarkable phenomena in the history of astronomy.* The observations which Tycho made on this singular body, were published at Copenhagen, in quarto, in 1573, under the title of *De nova stella, anno 1572, die Nov. 11. vesperti, in asterismo Cassiopeie circa verticem existente, annoque insequentis conspicua, sed mensis Maio magnitudine et splendore jam diminuta.*

About this time Tycho seems to have returned to Copenhagen, and was requested by King Frederick II. to deliver a course of lectures on astronomy, in which he gave a copious view of the science, and did not hesitate to defend the reveries of judicial astrology. The coldness which still existed between Tycho and his friends, notwithstanding the king's interference, induced him to think with seriousness, of settling in some distant country, where he might pursue, without interruption, the quiet researches of science. He accordingly left Denmark, and after travelling through Germany, and as far as Venice, he at length fixed upon Basle, in Switzerland, as a suitable retreat for himself and his family. But when he returned to Denmark to prepare for the removal of his family and his instruments, he found that Frederick had been informed of his views by the Prince of Hesse, and was resolved to detain within his kingdom a philosopher who was one of its great ornaments. He settled upon him a pension of 1000 crowns a year; he presented him with the canonry of Roschild, with an annual income of 2000 crowns; and he made over to him the island of Huen, and promised to erect in this sequestered spot an observatory, completely furnished with the choicest instruments. Elated with the munificence of his sovereign, Tycho gratefully accepted the generous offer: The foundation stone of the observatory, which he called Uraniburg, was laid on the eighth of August, 1576, and a building, 60 feet square, containing a commodious suite of apartments, and a subterraneous laboratory, was speedily completed at the

expence of nearly 20,000*l.* A detached building, called Stjernberg, or the Mountain of the Stars, was afterwards constructed by Tycho himself†

In this situation, so congenial to his wishes, Tycho continued to observe the heavens for nearly 21 years. He gave instructions in astronomy to a number of scholars, several of whom were sent at the king's expence, while others were supported and educated by himself; and though at a distance from society, he was honoured with frequent visits by many princes, as well as philosophers. Ulric, Duke of Mecklenburgh, accompanied with his daughter, the Queen of Denmark, and William, Prince of Hesse, were among the number of his guests.

In the year 1588, Tycho printed and distributed among his friends, a new work, entitled, *Tychonis Brahe Dani, de mundi atheri recentioribus phenomenonis liber secundus, qui est de illustri stella caudata anno 1577, conspecta.* This book, which contains the new positions of the stars, several methods of calculation, and details of astronomical observations and also discussions on the works which had already been written on this famous comet, was not finished till 1603, and bears on the title-page the date of Frankfurt, 1610. The cause of this delay in its publication was owing to some additions which Tycho was anxious to make to his work.

When James VI. of Scotland went to Copenhagen, in 1590, to conclude his marriage with the Princess Anne, he spent no fewer than eight days under the roof of Tycho, at Uraniburg. On his departure from Huen, James presented Tycho with a magnificent present; composed a set of Latin verses in honour of the astronomer; and accompanied his royal license for the publication of Tycho's works, with the following compliment to the talents of their author:

"Nor am I acquainted," says he, "with these things on the relation of others, or from a mere perusal of your works, but I have seen them with my own eyes, and heard them with my own ears, in your residence at Uraniburg, during the various learned and agreeable conversations which I there held with you, which even now affect my mind to such a degree, that it is difficult to decide whether I recollect them with greater pleasure or admiration; which I now willingly testify by this license to present and future generations," &c.

In consequence of an attack upon Tycho's treatise on the comet of 1577, by a countryman of our own, Tycho published a reply in 1591, entitled, *Tychonis Brahe apologetica responsio ad cujusdam periphetetici in Scotia dubia, sibi de parallaxi cometarum opposita.*

The death of Frederick II. was a severe blow to the fortunes of our author. His son, Christian IV., indeed, before his mind was poisoned by the advice of his wicked ministers, not only continued the pension of Tycho, but repaired to Uraniburg, in 1592, in the 15th year of his age, to visit the friend of his father, and the greatest astronomer of the age.

* See the article ASTRONOMY, page 679

† A plan of the Isle of Huen, and a view of the buildings, will be found in Hoffmann's *Portraits Historiques des hommes illustres de Danemarck.* See also the *Gentleman's Magazine* for November, 1789.

During the few days which he spent in the company of Tycho, he examined, with the curiosity natural to youth, all the apparatus of the observatory; and having shewn a particular fondness for a gilt tin globe, containing a representation of the starry heavens, Tycho presented it to the young king, and received in return a gold chain, as a token of his unalterable attachment. But the favour of princes was on this occasion what it always has been,—a gift during the pleasure of those who surround and flatter them. The envy of Tycho's great reputation, and perhaps a personal feeling, excited by the violence of his temper, or the keenness of his satire, instigated the advisers of the young king to forget the hospitality which he received at Uraniburg, and to deprive Tycho of his pension, and of the canonry of Roschild. The minister Walchendorf, a name blackened in the eye of science, will descend to posterity loaded with the execrations of every wise and virtuous man.

Being thus deprived of the means of supporting his establishment in Huen, Tycho quitted that favourite retreat, endeared to science by the importance of his labours, and removed to Copenhagen, where he waited for the earliest opportunity of leaving for ever an ungrateful country.* With his wife and children, and instruments, he landed at Rostock, and spent a year at Wansbeck with his friend Henry Rantzau or Ranzovius, who published in 1600 a treatise on astrology, and who was intimately acquainted with the Emperor Rodolph II. a great amateur of alchemy and astrology. Before our author left Uraniburg, he completed his work, entitled *Tychonis Brahe Dani Epistolarum astronomicorum libri, quorum primus hic illustriss. et landatiss. principis Gulielmi Hassie Landtgravii, ac ipsius mathematici literas unaque responsa ad singulas, complectitur. Uraniburgi ex officina typographica authoris 1596*; and during his stay with Rantzau, he published his *Astronomiæ instauratæ Mechanica*. Fol. Wandesburgi 1598 †

The last of these works was dedicated to the emperor Rodolph, as a preparatory step to the personal introduction to that monarch, which Tycho was promised by his friend Rantzau. The wishes of our author, however, were anticipated by a flattering invitation from the emperor, which Tycho gratefully accepted; and he repaired to Prague in 1599, where he met with the most welcome reception. This generous patron of merit erected, in the neighbourhood of Prague, a commodious observatory for his friend, and settled upon him an annual pension of 3000 crowns. Tycho now looked forward to better days. He renewed with delight, the labours which he had so unwillingly relinquished, and had the singular felicity of having for his pupils two such celebrated men as Kepler and Longomontanus. His spirits, however were broken with sufferings and disappointment; and neither the continued kindness of his be-

nefactor, nor the society of such able pupils, could sooth his agitated mind. The severity of his studies had begun to affect his bodily strength; and finding himself encircled with new friends in a distant land, the melancholy remembrance of former attachments, which even the ingratitude of his country could not extinguish, contributed to prey upon his mind. The most trifling occurrences were magnified by his diseased imagination into prodigies sent from heaven; and from his sallies of wit and pleasantry, his mind frequently turned to the contemplation of his latter end. A suppression of urine, attended by the most agonising pains, induced a violent fever and a temporary delirium, during which he often exclaimed "*Ne frustra vixisse videar*." These violent paroxysms left him in a state of extreme debility, but in the full possession of his mental powers. He saw that death was inevitable: He composed an extempore copy of verses: He exhorted his pupils to persevere in their labours: He conversed with Kepler on some of the profoundest points of astronomy; and he mingled with these amusements frequent acts of piety and devotion. In such a frame of mind he expired, without the least symptom of pain, on the 24th of October, in the 55th year of his age. A monument, containing the figure of a knight, in rude sculpture, was erected to his memory in the Tein church at Prague, where his remains were deposited; and his wife, with two sons and four daughters, were left to lament his loss.

Tycho was a man of the ordinary size, with light red hair, and a pleasing manly countenance. In his temper he was irritable and passionate, and even sullen and unbending. He possessed an unfortunate turn for satirical invective, without the power of bearing the raillery of others. The misfortunes of his life were perhaps owing to this unhappy propensity, which frequently exposed him to the enmity of those who suffered from his wit. But we have no means of ascertaining whether this licence which he gave to his tongue was a foible, or a vice. His religious principles were too well founded, we think, to permit the supposition, that malice was in any case mingled with his satire.‡

The merits of Tycho as an astronomer have already been fully estimated in another part of our work.§ His miscellaneous labours have not yet fallen under our notice. That a philosopher like Tycho, addicted to the study of the most demonstrative of the sciences, should have indulged in the pursuits of alchemy, and in the study of judicial astrology, must be ascribed, not only to the character of the times in which he lived, but to a natural love of the marvellous, which seems to have been predominant in his mind. Even at Uraniburg, in the midst of his glory, his greatest delight was to astonish his visitors, by making his pupils appear before them without any apparent communication. If he met with an old woman or a hare, he durst not prosecute his journey;

* It is said by some of his biographers, that he resumed his observations at Copenhagen; and that Walchendorf intimated to him the king's order to discontinue them:—an order equivalent to a sentence of banishment.

† M. Messier has at present in his possession the copy of this work which Tycho sent to Rantzau. It is covered with satin, and the portrait of Tycho is illuminated.

‡ "*Nihil fictum; nihil simulatum in ipso; sed scaphum scapham appellabat; unde omne quod sustinuit odium*." JESSENIUS, *Fun. Orat.*

§ See *History of ASTRONOMY*, p. 595, 596.

and he kept an idiot constantly beside him, whose incoherent expressions were stored up and examined by Tycho as the predictions of some supernatural being. A desire to be consulted as a fortune-teller was another of the failings of this extraordinary man. He calculated the nativity of his patron Rodolph, and having predicted that some wicked designs would be practised against him by his relations, the timid emperor was seized with alarm; and when the bad conduct of his brother seemed to verify the prediction, he confined himself to his palace, and actually fell a prey to the fear which it inspired.

From these facts, we cannot be surprised at his attachment to alchemy and astrology; but we can find no explanation of the deceit which he must have practised, when he made an apology for not publishing his chemical experiments. "On consideration," says he, "and by the advice of the most learned men, he thought it improper to unfold the secrets of the art (of alchemy) to the vulgar, as few people were capable of using its mysteries to advantage, and without detriment."

Medicine was also a favourite study with Tycho. He gave his medicines and his advice gratis; and he published an account of the composition of an elixir for the plague, which was addressed to the Emperor Rodolph.

Tycho was likewise a worshipper of the muses. He wrote Latin verses, and composed a poem on his exile, which was published at Rostock in 1614. His taste for architecture seems to have been good. He drew the plan of the castle of Cronberg, and sketched the design for the mausoleum of Frederick the Second, which was executed in Italy, and erected in the cathedral of Roschild.

Beside the works which we have mentioned, Tycho wrote the following: *Astronomiæ instauratæ Pro-gymnasmatæ: quorum hæc prima pars de restitutione motuum solis et lunæ, stellarumque inerrantium tractat*, 1602, 4to; — *De mundi ætherei recentioribus phenomenon tiber secundus*, 1603, 4to; — *De disciplinis mathematicis oratio, in qua simul astrologia defenditur, et ab objectionibus dissentientium vindicatur*, Hamburg, 4to, 1621. The works of Tycho were published at Frankfort in 4to, in 1648. In 1657 a collection of his observations was published at Vienna in folio, under the title of *Lucii Baretii (Alberti Curtii) Sylloge Ferdinandeæ, sive Collectanea historię celestis e commentariis MSS. observationum Tychonis Brahe ab anno 1582 ad annum 1601*; and afterwards in 2 vols folio, at Augsburg, under the title of *Historia Cælestis complectens observationes Tychonis*. The last of these works, which is a most valuable collection of observations, occupies more than 1000 folio pages; and was afterwards reprinted at Augsburg and Vienna in 1668; at Ratisbon in 1672, and at Dillingen in 1675, &c. &c. The Rudolphine Tables, which Tycho left unfinished, were published at Ulm in 1627, in folio, entitled *Jo. Kepleri Tabulæ Rudolphinæ, quibus Astronomiæ scientiæ, temporum longinquitate collapsæ, restauratio continetur, a Tycho Brahe primum animo concepta et destinata anno Chr. 1564, exinde observationibus siderum accuratissimis post annum præcipue 1572, serio affectata, tan-*

dem traducta in Germaniam inque aulam et nomen Rudolphi Imp. anno 1598.

The instruments of Tycho were purchased by the Emperor Rodolphus for 22,000 crowns of gold.— During the troubles of Bohemia, the army of the Elector Palatine destroyed the greater part of them; but the great celestial globe of brass was preserved, and deposited with the Jesuits of Neyssa in Silesia. In 1633, Udalric, the son of Christain, king of Denmark, carried it to Copenhagen, and placed it in the hall of the Royal Academy.

See Gassendi *Vita Tychonis Brahe*, &c. Paris. 1654: Coxe's *Travels in Denmark*, vol. v. p. 191; *De vitæ et mortis illustris. et generosi viri TYCHONIS BRAHEI, oratio funebria Joh. Jessenii à Jessen*. Pragæ 1601; and a *Life of Tycho* by Weistriss, published in Danish and in German. The German translation appeared at Leipsig in 1756, in 2 vols. 8vo. (ß)

BRAIN. See ANATOMY, PHYSIOLOGY, and SURGERY.

BRAINTREE, a market town of England in Essex, situated on a rising ground, and chiefly remarkable for its baize manufactory, which was introduced here by the Flemings, who were expelled from the Netherlands by the cruelties of the Duke of Alva. The streets are narrow and inconvenient, and many of the buildings are very old, and formed of timber. The church is a large building erected on a high piece of ground, which seems to have been once occupied by a camp. This church underwent several alterations in the reign of Henry VIII., the expense of which was defrayed from the profits of three plays acted in the church. The first of these, called *St Swithun*, was performed in 1523; the second, entitled *St Andrew*, was performed on the Sunday before Relique Sunday in 1525; and the third, called *Plucy Dacy* alias *St Ewestacy*, in 1534. After the Reformation, the church wardens sold the contents of the players wardrobe for 50 shillings, and the play books for 20 shillings. The number of houses in this town in 1801 was 454, and the population 2821. The village of Bocking, consisting of one long street, forins now a part of the town, and contains no fewer than 623 houses and 5680 inhabitants, of whom above 600 were employed in the manufacture of baize. See Morant's *History of Essex*. (j)

BRAMAH'S MACHINE, or PRESS FOR PRINTING BANK NOTES. Contrary to our usual practice, we have been obliged to introduce a description of this ingenious machine under the name of its inventor. It was out of our power to obtain a drawing and description of it when we were engaged in that part of our work which contains the word BANK, and we have therefore thought it more advisable to insert our account of it in this place, than to refer it to some more distant article, where the insertion of it would be equally inconsistent with our general plan.

In many other parts of our work we shall have occasion to direct the attention of the reader to the inventions of Mr Bramah, which are no less creditable to his genius, than they have been useful to society. His improvements upon locks; his rotatory engine for raising water; his hydrostatic press, ap-

plied to cranes, and to the sluices of canals; his improvement on the steam engine; his planing machine, for producing parallel surfaces on wood; his method of cutting screws and turning spheres; his equalising tool, or apparatus for turning cylinders at one operation; his method of introducing steam into the upper coppers of Breweries; his contrivance for locking carriages; his improved pens, by which no part of the quill is lost; and his new plug and sliding cocks; will all come under notice in the course of this work.

It was formerly the custom in the Bank of England to fill up the numbers and dates of their notes in writing till the year 1809, when the machine invented by Mr Bramah was adopted for this purpose. By this contrivance, the numbers and dates were inserted not only in a more uniform and elegant manner, but the labour was diminished to less than one-sixth of what it was before.

The copperplates, from which the words of the notes are printed, are double; that is, they throw off two notes at a time upon one long piece of paper. This piece of paper, containing two notes, is then put into the machine, which prints upon them the number and dates in such a manner, that the types change to the succeeding number, and that the whole operation is performed without any attention on the part of the clerk. If one of the notes, for example, is No. 1, No. 1, and the other on the same paper No. 201, No. 201, when these are printed the machine alters itself to No. 2, No. 2, and No. 202, N. 202; and in printing these, the types again change to No. 3, No. 3, and 203, 203. The date, and the word London, are cast in stereotype, and each machine is furnished with one of these for each day in the year, and they of course are changed every day.

The Bank of England have upwards of 40 of these machines the greater part of which are in constant use. It was formerly considered sufficient labour for each clerk to fill up with the number twice repeated, and date twice repeated, 400 notes per day; but since the introduction of the machines, one clerk has printed 1300 double notes, which are equal to 2600 single ones; for though in the machine the double notes do not require more labour than single ones, yet to fill up the blanks by writing, would occupy twice the time.

The mechanism by which this is effected is extremely ingenious, and the principle is not limited to the numbering of notes, but is equally applicable to the purpose of printing any series of numbers which require continual alteration. In Plate LXXVI. we have represented one of these machines, which is not, however, precisely the same as any of those in use, being only a single one, and adapted for printing one note at once; but we have only to suppose it extended to twice the length, and furnished with a double set of types, in order to fit it for printing two notes at the same time. In Fig. 2. of Plate LXXVI., a perspective view of this machine will be found, and a section of its parts at Fig. 1. in both of which the same letters of reference are employed. A solid piece of mahogany, A A,

forms the base of the machine, and to this two iron plates B B are screwed, forming the sides of a box, the front of which is removed in Fig. 2. to exhibit the interior, and the back is concealed behind the mechanism. Across this box, an axis D is placed, having its pivots fitted into sockets, which are fastened in the sides of the frame, as is evident from the figure. This axis carries the tympan E, which gives the pressure to print off the note attached to it by screws; and a lever F is also fixed to the axis, by which the operator forces down the tympan. The moveable types, in which the principal novelty of the invention consists, are fitted into a series of brass circles, mounted upon an axis G, extending across the centre of the frame. These circles are sufficiently pointed out in the perspective view, by the numerals on the types fixed in them; they are ten in number, arranged in two lots of five each. Each circle (shewn more plainly at I, Fig. 1.) is divided into 11 parts, and at each a rectangular notch is cut, to receive the types 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. and a blank type. Five of the circles, thus prepared, being placed side by side, upon a fixed axis, G, on which they revolve freely, are sufficient for printing any number less than 100,000; because, as the circles can be turned about on their axis independent of each other, it is obvious, that any combination of the above figures may be produced, by bringing them to the highest point of the circle, which is the situation in which they are placed when an impression is to be taken. This will be more easily understood, if we consider that the brass plate, which covers up the circles, is put in its place, as represented in Fig. 1. at a. This brass plate has two apertures through it, to receive the two series of types which project up a little above its surface when at the highest. In Fig. 2. this plate is removed, to exhibit the interior mechanism. The circles are made to revolve by means of wheels H, upon an axis, called the back axis, parallel to the axis of the circles. The end of it is seen at I, Fig. 2. projecting through the frame, and it carries three of the wheels H, two of which are at the same distance apart as the two series of figure circles to which they apply. The third wheel is placed at an intermediate distance between the other two, and is acted upon by a catch or pallet b, Fig. 1. attached to the axis of the tympan, by means of a joint, in such a manner, that it will strike against the highest tooth of the wheel H, and turn it round one tooth. When the handle is lifted up rather beyond the perpendicular, where a stop d, Fig. 2. upon the axis, meeting a projection d, Fig. 1. on the cover of the box, prevents it from moving farther; but when the handle is returned down into the position of Fig. 1 the pallet, though it again meets the tooth of the wheel, gives way upon its joint, and passes by without moving the wheel. In this manner, it will be seen, that every time the handle is pressed down to take an impression, in raising it up again, to place a fresh paper upon the tympan, the pallet moves the wheels H one tooth, and as the teeth of these wheels engage the teeth of the figure circles, a similar motion is communicated to them, bringing a fresh number beneath the tympan, ready for printing.

It is to be observed, that the wheels H are of such

a thickness, as to engage only one of the five type circles at once, and their distance from each other is such, that they take the same circle in the one series as they do in the other. Now, by moving the back axis a small quantity endwise, it is obvious that the wheel H can be brought to act upon any of the five circles, or be placed in such a position as to be clear of them all. It is for this purpose that the head I, Fig. 2, comes through the frame of the machine; for by means of this the axis can be moved on end, and by proper marks upon it, it may be set to any of the five circles. In these positions it is confined by a semicircular clip, which enters grooves turned round on the axis, and deprives it of longitudinal motion, unless when the clip is raised. This can be done by a nut coming through the back of the frame at K, Fig. 1. It has a short lever on the inside of it, which, when the nut is turned round, raises up the clip, and releases the axis while it is set to the required circle, and the clip being let fall into the proper groove, confines it from any farther motion. In order that all the circles may stop at the exact point, when the figure is at the highest, and consequently when the surface of the figure will be horizontal, an angular notch is made on the inside of the figure circles, in the intermediate spaces between each figure; and at the lowest point of the circle *c*, Fig. 1, a moveable pin is fitted into the fixed axis, with a spring, which gives it a constant pressure downwards. The end of the pin is formed spherical, and well polished, so that when the circle is turned round, it is forced into its hole in the axis; but when another notch in the circle presents itself, the pin presses out into it, and retains the circle with a moderate force in its proper position, until the raising of the tympan, as before described, overcomes the resistance of the pin, and turns the circle round. By this contrivance, the types always arrange themselves into a straight line, after being turned round, without which the impression would have a very disagreeable and irregular appearance. The tympan E, Fig. 1, is composed of two parts: a solid brass plate, against which a few folds of cloth are placed and secured by the second part, which is a brass frame, covered with parchment, and attached to the former by four screws, two of which appear at *f f* in Fig. 2. The brass plate of the tympan is fastened to the leaf L, Fig. 1, projecting from the axis, by means of six screws. Two of these, only one of which, *h*, can be seen in the figure, tend to throw the tympan from the leaf, while the other four, which are arranged one on each side of the two former, draw the tympanum and leaf together. By means of these screws thus acting in opposition, the tympan can be adjusted so as to fall exactly parallel upon the type, and communicate an equal pressure to all parts of the paper, which is held against the tympan by means of a frisket of parchment, stretched on a frame which surrounds the tympan, and is moveable on joints at *k, k*, Fig. 2. The frisket is cut through, as represented by the shaded parts in Fig. 2, in order to expose the paper where it is to receive the impression of the figures, and the N^o before the figures, and also the impression of the date, year, and place. The type for these are formed in stereotype, and fastened down upon the surface of the brass cover *a*,

the piece containing the day and month being changed every day. In order to find the proper position which the paper should occupy upon the tympan, two fine pins are fixed to project from it, and are received into holes made in the brass cover: Two dots are printed upon the note from the copper plates, and the pins being put through at these dots, ensures the figures, &c. coming on their proper places.

The manner of using the machine is as follows: Suppose the back axis put so far on end as to be detached from all the circles;—the figure circles arranged by hand, so that the blanks are all uppermost; and the proper stereotypes put in for the date; the back axis is then first set, so that its wheels H may take the first of the five circles towards the right hand, and, by moving the handle down almost to touch the type, and returning it up again, the pallet moves the wheels H, and turns the two right hand circles, bringing up figure 1. The clerk now inks the type with a printer's ball, opens the frisket sheet L, Fig. 2, on its hinges, and places the note, (already printed in the copper-plate press), against the tympan, the proper place being determined by the two pins and the dots printed on the note, as before mentioned. He now shuts up the frisket sheet, in order to confine the paper and to keep it clean, except in the places where it is to be printed; then, by pressing down the handle F, the impression is given; and on lifting it up again, it moves the circles and brings up figure 2. The note is now removed, a fresh one put in, and so on, the figure always changing every time. During this operation, the two right hand circles act as units, and advance one each time. When 9 are printed in this manner, and 0 comes up, the handle is moved twice successively without printing, which brings up a blank and then 1. The back axis is moved, to act upon the second circle from the right hand, which now becomes the units, the first circles representing tens; by moving the handle *a*, without printing, figure 1 in the second circle comes up, making 11, the next time 12, and so on to 19. The first circle is now put forwards by hand, bringing up 2 and 0, on the second 20, then moving the handle to pass the blank, produces 21, 22, &c. to 30, when the first circle is again advanced, bringing up 4; in this manner the business proceeds to 99. The back axis is now shifted to the third circle, which becomes units, the second tens, and the first hundreds; the 0 and blanks of which are advanced to bring up 1 0; is brought up in the second; and the machine itself brings up 0 in the third; after printing this, it changes to 101. The process now continues through the successive hundreds in the same manner as before, till 999. The back axis is now shifted to the fourth circle, and the three first must be advanced by hand when they require it. At 9999 the back axis is shifted to the fifth circle, and will serve to 999,999, beyond which it is not required to print.

BRAMPOUR. See BURHAMPOUR.

BRAMPTON, a market town of England, in Cumberland, situated on the river Irthing, in a narrow and deep vale. It consists chiefly of a wide street very irregularly built, and carries on no manufacture of any importance. Camden supposes it

to be the *Bremeturacum* of the Romans, and the station of the first cohort of the Tunguri. At the east end of the town there is a huge mount of a conical form, and about 360 feet in perpendicular height. A rampart and trench encircle the moat at its summit, which is a plane about 120 feet in diameter, defended by a breastwork. Number of houses in 1801, 346. Population 1682. (π)

BRANCH. See BOTANY, p. 55.

BRANCHIOPODA. See ENTOMOLOGY.

BRANDENBURG, MARQUISATE OF, a country of Germany, bounded on the north by Mecklenburg and Pomerania; on the east by Poland; on the south by Lower Lusatia, and the electorate of Saxony; and on the west, partly by the duchy of Magdeburg, and partly by the duchy of Lunenburg. This important province, which forms the basis of the possessions of the House of Brandenburg, is divided into the departments of the *Old Mark*, the *New Mark*, the *Middle Mark*, the *Ukraine Mark*, the *Vor Mark*, or the *Mark of Priegnitz*; and the lordships of *Beeskow* and *Sterkow*. The *Old Mark*, which is about eleven German miles long by nine in breadth, contains thirteen cities, the chief of which is Stendal, and about 8058 hides of taxable land. The *New Mark* is a tract of land about forty geographical miles in length, and only ten in breadth. It consists of seven original, and four incorporated circles, besides Custrin the capital; and has a regency of its own, courts of justice, and other colleges. It contains thirty-nine cities, and 16,738 hides of taxable land. The *Middle Mark*, which is the largest of all the departments of Brandenburg, contains about forty-eight cities and towns, the principal of which are Berlin, Brandenburg, and Potsdam; and has about 24,901 hides of taxable land. The *Ukraine*, or *Ucker Mark*, about thirteen German miles in length, and eleven in breadth, is divided into the two circles of *Ucker Mark* and *Stolp*, and contains fifteen towns, the chief of which is Prenzlau. The hides of land that are taxable are about 6379. The *Vor Mark*, or *Mark of Priegnitz*, ten and a half German miles in length, and seven and a half in breadth, contains twenty towns, the principal of which is Perleberg, and has 5211 hides of taxable land.

The whole country of Brandenburg is, in its greatest extent, about 200 miles from west to east, and about 110 miles from north to south. The soil, though in general inclining to sand, varies considerably in quality. Even in the most sandy and barren parts of the country, the industry of the inhabitants has been able to raise considerable crops of rye, barley, and oats; nor is this kind of soil found at all unfavourable to the culture of the vine, and the productions of the garden. Pines, and other resinous trees, are likewise planted here, and their growth fully answers the most sanguine expectation. A great proportion of this marquisate, particularly on the banks of the Oder, is extremely fertile; and the high perfection to which agriculture has been carried, through the judicious exertions of Frederic William, and his successor Frederic II. has produced the most beneficial change on the general appearance of the country. Tracts of land, which formerly

were mere sandy deserts, now bear luxuriant crops of wheat, spelt, and barley; unwholesome marshes have given place to rich and smiling fields; and places over which extensive but unprofitable forests once threw their dismal shade, are now enlivened by large and handsome villages. Yet agriculture, highly improved as it is, is by no means the principal object of attention in the Marquisate of Brandenburg. The greater part of its inhabitants depend for subsistence upon the rearing of cattle, particularly of sheep, whose wool, being of a very fine quality, forms the basis of the beautiful woollen manufactures which abound in that country. Their breed of sheep was much improved by the care of Frederic II., who procured a number of rams from England and Spain. Silk-worms are likewise cherished here with such success, as to become daily an object of more attention and importance. Nor among the advantageous productions of this country must we forget its woods, which not only supply the inhabitants with fuel for domestic use, as well as for their glass and iron furnaces, for charcoal, tar, and wood-ashes, but likewise with large quantities of timber for house and ship-building, a great proportion of which is exported to France, Holland, Hamburg, and other parts of the continent. Yet notwithstanding this immense consumption of wood of every description, the forests are managed so judiciously as never to be exhausted.

The mineral productions of Brandenburg, though not distinguished by their variety, are of considerable importance. Among these we may reckon a white earth well adapted for pottery, and a very fine porcelain clay; also various kinds of earths capable of being converted into colours, alum, saltpetre, amber, and ironstone. Petrifications, and other fossil curiosities, are likewise to be met with in various parts of Brandenburg.

Before the reign of Frederic William, the grand elector, manufactures had made but little progress in this country, or rather had been altogether extinguished by the ruinous war of thirty years. His wise and paternal exertions in behalf of his native dominions soon changed the scene; and Brandenburg became, as it were, a new country, peopled by a mixture of colonies from many different nations, who brought along with them the arts and the manners of their respective countries. The Dutch, who took the lead in this system of colonization, renewed the order of tradesmen and artisans; conceived the project of felling the lofty trees, which, as the war of thirty years had converted the whole country into one vast forest, were now found in great abundance; and thus established one of the most lucrative branches of the commerce of Brandenburg. The elector likewise permitted some families of Jews to settle in his dominions, as the vicinity of Poland rendered their services useful for vending in that country the refuse of Brandenburg merchandise. But no event was more favourable to the enlightened projects of the great elector, than the revocation of the edict of Nantes by Louis XIV. Upwards of four hundred thousand Frenchmen were driven, by that measure, from their native kingdom, the most affluent of whom emigrated to England and Holland; while the poorer, but more

industrious, taking refuge in Bradenburgh, to the number of about twenty thousand, helped to repeople deserted towns, and taught the natives those manufactures of which they were yet ignorant. On the accession of Frederic William to the government, neither hats, nor stockings, nor serges, nor, in short, any woollen stuffs whatever, were fabricated in his dominions. The industry of the French soon enriched them with these manufactures. They established fabrics of broad cloths, serges, strainers, small stuffs, druggets, crape, bonnets, and stockings woven in the loom; hats made of the fur of beavers, hares, and rabbits; and dyes of every kind. Some of these refugees became merchants, and sold by retail the products of the labour of others. Some of them settled in the capital, as goldsmiths, jewellers, watchmakers, or engravers; and those who took up their residence in the flat parts of the country, cultivated tobacco, and reared fruits and excellent pulse in the sandy districts, which, through their fostering industry, were converted into admirable kitchen gardens. The elector, to encourage so useful a colony, assigned it an annual pension of forty thousand crowns, which it still enjoys.

These beneficial projects were adopted and improved upon by Frederic II., the son and successor of Frederic William, who reaped the full advantage of his father's labours. The tapestry of Brandenburg now rivalled that of Brussels; its galloon-lace equalled that of France; the mirrors of Neustadt surpassed in their clearness those of Venice; and the Prussian army was arrayed in cloth of home manufacture. To give new energy to that spirit of industry which the foreign colonies had excited, Frederic prohibited, by a severe edict, the exportation of wool; he established a public magazine, named the Lagerhaus, from which quantities of wool were advanced to poor manufacturers, who repaid it by the produce of their labour; the army, which was newly dressed every year, ensured a ready sale for their cloths; they even found their way into foreign markets; and in the year 1733, the manufactures of Brandenburg were in such a flourishing state, that they furnished for exportation forty-four thousand pieces of broad cloth, each twenty-four ells long. With these improvements, a spirit of frugality, scarcely less beneficial, was introduced among all orders in the state. During the preceding reign, many of the nobles had sold their lands, to be enabled to purchase gold-cloth, and lace; now that abuse was done away, and the proudest grandees were contented with such articles of dress as the manufactures of their native country could afford. This regard to economy was the more necessary, as in most of the Prussian states the right of primogeniture is disclaimed; and fathers, who have a numerous family, can procure, only by rigid parsimony, a respectable establishment for those, who, after their death, are to divide their family into new branches.

Amidst these important arrangements, one great deficiency remained yet to be regretted. As if every mind had been engrossed by the grand concern of encreasing the opulence and multiplying the comforts of the community, scarce a thought was bestowed on those more elegant, but less essential arts, which "exalt, embellish, and render life delightful." While agriculture and manufactures were carried to the highest degree of improvement, literature and science, with all the kindred accomplishments which tend at once to refine the taste and to polish the manners of a people,

VOL. IV. PART II.

were left to languish for want of encouragement. Even commerce was checked by the narrow views of a government, more anxious to guard against poverty by repressing extravagance, than to extend the public resources, by opening new channels for superfluous commodities, and thus offering new incitements to industry. It was reserved for Frederic II. to introduce a more liberal and enlightened policy. Aware how much commerce contributes to the power of a state, he favoured and prosecuted it by every practicable method; awarding premiums to those who were most active or successful in its various branches, and forming some considerable commerical establishments. His passion for literature, science, and the fine arts, being caught by many of his subjects, gave new life to the universities, academies, and seminaries, which had been formerly almost wholly deserted; and the crowds of learned men and accomplished artists, which his liberality attracted from every country in Europe, effected the happiest change in the taste and manners of the native inhabitants. For a more ample account of the commerce and literary institutions of Brandenburg, we must refer our readers to the articles PRUSSIA and BERLIN. We may only observe, that the Transactions of the Berlin Academy, of which many volumes have been published, do much credit to Prussian science; and that the specimens of painting, statuary, and engraving, which are occasionally produced in Potsdam and Berlin, might be acknowledged without a blush by the first artists in Europe.

There is no country on the continent, where the internal intercourse is more facilitated by excellent roads and regular stages than in Brandenburg. The rates of postage, and even the fare of postilions, are regulated by government; so that travellers can calculate their expenses to the minutest item, without being teased by incessant importunities, or vexed by arbitrary impositions.

The posts are likewise managed with much order in Brandenburg, and letters are conveyed with the utmost regularity and expedition. The two grand mails which go from Wesel to Memel in Prussia, and thence throughout Russia, and from Hamburg, by the way of Silesia, into Poland and Hungary, meet at Berlin, and are regulated in such a manner, that all these posts arrive and depart at eight o'clock in the evenings of Tuesday and Saturday.

The internal communication is still farther facilitated by the two great rivers, Elbe and Oder, which traverse the country in different places. The Elbe enters the Old Mark at Polke, and forms its boundary on the west. It receives the stream of Tanger, near Sangermunde, and the Havel, a navigable river, near Werber. Thence it flows between the Old Mark and Priegnitz, till it comes nigh Wittenberg, when it is joined by the Stepenitz, a river so considerable as to be navigated by boats. The Elbe leaves the Old Mark near Wancter, but continues to flow along the side of Priegnitz, from which it receives another river named Aland near Schnackenburg, and last of all the tributary stream of Elde, in the country of Mecklenburg. The Havel issues likewise from the country of Mecklenburg, forming, in a certain part of its course, the boundary between the duchy of Mecklenburg and the Ukraine Mark, and is navigable to large wherries from Fursenberg to Tchelenich. At Spandau it is swelled by the Sprée and the Dosse, and thus becomes navigable

3 E

to vessels of considerable burden till it falls into the Elbe. Its tributary river Sprée, issuing from Lusatia, is large enough at Krasnich to bear rafts and floats, and becomes navigable at Cossenblatt. It receives another stream named Wendische Sprée, at Kopenich, and loses itself, as we have already mentioned, on the Havel at Spandau. In its course it traverses several lakes, and is divided, at different places, into several branches. The Oder, a fine navigable river, flowing from Silesia, penetrates the New Mark; receiving in the circle of Crossen the tributary river Ober, which issues from Poland; the stream Bober, below the town of Crossen; and above Küstrin, the Waste, which is itself swollen by the waters of the Notze and the Drague. Below Writgen it is joined by the Old Oder, which takes its rise in the circle of Lobus; next by the Finow, and last of all by the Welze; after which it penetrates into the country of Pomerania.

Brandenburg enjoys, also, the advantage of many excellent canals. One of these, named the canal of Planen, was executed by Mahistre, a celebrated engineer, at the command of Frederic II. By this canal, which was begun and completed in the interval between the first of June 1743, and the fifth of June 1745, the navigation from Berlin to Magdeburg is shortened by one half. It commences near Parei, upon the Elbe, and crossing the rivers Ihle and Stremna, proceeds to join the Havel near Planen, over a line of 8655 perches. This canal is twenty-two feet wide at the bottom of its channel, twenty-six at the surface of the water, and from forty to fifty between its banks. It has nine bridges at various intervals; and three sluices, which, keeping the water at the height of twenty-one feet, give a singular facility to navigation from the Elbe to the Havel.

A similar navigation has been effected between the Sprée and the Oder, by means of a small canal, by order of the elector Frederic William, whose name it retains. It is about three German miles in length, and its depth is five Rhenish yards. At Mülrose, a town near the middle of the canal; the stream of Schulabbe falls into a lake, from which the canal is supplied with water. It passes through ten sluices placed at regular intervals, and its fall, throughout its whole length, is supposed to be not less than sixty-two feet. Another canal, called the canal of Finow, unites the Havel with the Oder, taking its direction from Licbenwalde towards Oderberg, after having crossed the river Finow: it has thirteen sluices, and was cut by order of king Frederic II. about the same time with the canal of Planen. In a course of about twelve thousand Rhenish miles, it has a fall of 130 feet.

Another canal was made in the year 1753, called the new canal of the Oder. It draws its waters from that river near Gustebiese, and pours them into it again about a mile below Oderberg. There are likewise in the Marquisate of Brandenburg a number of lakes, some of which are united by canals, or natural channels. Neither the Elbe nor the Oder abound so much with fish as the Havel, the Sprée, and the other small rivers: and the same analogy holds with regard to the lakes.

Brandenburg is said to have been occupied by the ancient Suevi, of whom there were several colonies or subdivisions. This country must have been known to the Romans, who, about the commencement of the Christian æra, pursued their conquests as far as the

Elbe. Their progress in this direction was checked by the barbarous but valiant inhabitants, by whom it continued to be occupied till the fifth century, when they pushed farther to the south, abandoning their own country to the Veneti or Wendi, a Sarmatian tribe, whose language corresponds to that of the Poles, Russians, Bohemians, and other Sclavonian nations, and who, under the general name of Sclavi, occupied not only Brandenburg, but the whole tract of country situated between the Elbe and the Vistula. With these people, who were inveterate enemies to the Christian religion, the kings of the Franks waged perpetual war; and to reduce them to subjection was always a grand object with Charlemagne and his successors. They maintained an obstinate struggle for their independence till the year 927, when they were finally subdued by Henry the Fowler, who compelled them to adopt the Christian religion, and bestowed their country on his brother-in-law Sigefrid, a Saxon Count, with the title of Margrave, or lord warden of the marches or borders. Sigefrid newpeopled his dominions from the Netherlands, Westphalia, Franconia, and Saxony; and soon after this conquest, the Saxon emperors established the four Margraviates of AUSTRIA, of the EAST, (or Misnia and Lusatia) of the NORTH, and of SCHLESWIG, to defend the frontiers of Germany against the Huns, Sclavonians, and Danes. The Margraviate of the north was established for the purpose of opposing the Sclavonians of Brandenburg; and the dignity of Margrave continued to be conferred by the emperors at pleasure, till Albert, of the house of Anhalt, surnamed the Bear, obtained possession of Brandenburg, the capital, about the beginning of the twelfth century, and as a reward of his valour, was made by Conrad II. hereditary Margrave of the kingdom, which he had subdued. Albert conquered all the country between the Elbe and the Oder, converted the Sclavonian inhabitants to Christianity, peopled the country with a numerous colony of Germans, whom a great inundation had compelled to emigrate from Holland, and thus became the true founder of this Margraviate, which was possessed by his descendants till the year 1340, when the family became extinct. The emperor Louis of Bavaria, then reigning, conferred the Margraviate of Brandenburg on his son Louis. It remained in the house of Bavaria only till the year 1373, when Otto of Bavaria sold it for 100,000 florins of gold to the emperor Charles IV., king of Bohemia, of the house of Luxemburg. The emperor Sigismund, the son of this Charles, after having alienated the New Mark and other valuable parts of Brandenburg, sold the remainder, for the enormous price of 400,000 ducats, to Frederic, Count of Zollern, and burgrave of Nuremberg, an able prince, who had established the weak Sigismund on the imperial throne, and supported him there by his valour, his prudence, and his treasures. This Frederic is the ancestor of the present royal family of Prussia. The princes of this house soon recovered the alienated territories of Brandenburg, and enlarged them by the gradual accessions of Pomerania, Prussia, Silesia, the duchy of Magdeburg, the principality of Halberstadt, the duchy of Cleves, the countries of Minden, Marck, Ravensberg, Lingen, Meurs, Ostfrisia, Neufchatel, Glatz, part of Lusatia, and of the palatinates of Posnania and Uladislav. These were the component parts of the Prussian monarchy, which under the illustrious Frederic II. per-

formed so brilliant a part in the transactions of Europe. The glory of this kingdom, however, was but short-lived; and the failure of the Prussian arms in France and Poland during the reign of his nephew, soon convinced the world, that the machine owed all its energy to the great Frederic's mighty and animating soul. See PRUSSIA.

The king of Prussia, as elector of Brandenburg, possesses the seventh place among the electors of the empire; and has five voices in the college of princes at the diet of the empire, independently of his voice in the electoral college. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water in a silver bason. He enjoys, likewise, the right of levying customs, in virtue of a particular privilege granted by the emperor Frederic III. in 1456, by which that emperor assigns to the electors of Brandenburg, an unlimited power of raising and establishing customs and tolls.

The states of Brandenburg consist of the nobility and towns, who assemble at Berlin, and who still retain some shadow of their ancient privileges. The hereditary officers of the marquisate are a marshal, chamberlain, cup-bearer, purveyor, sewer, treasurer, and ranger.

The inhabitants in general follow the Lutheran religion, but the religion of the coast is Calvinism. There are likewise a considerable number of Roman Catholics; and all enjoy the most perfect liberty of conscience. Population 755,577. See *Memoires de la Maison de Brandebourg*; Busching's *Geography*; and Peuchet's *Dictionnaire*, &c. (k)

BRANDENBURG, an ancient city in Germany, and formerly the capital of the marquisate to which it gives name. It is situated in the middle Mark, upon the banks of the Havel, which divides the old town from the new, and is here large enough to be navigated by boats of considerable size, which ply hither from the Elbe by means of the canal of Planen. The streets of the new town are straight and beautiful. The principal curiosities and public buildings are, the House of Invalids, the barracks, the bridge over the Havel, the church of St Catherine, remarkable for its antiquity, its library, and its baptismal founts; the cathedral at Bug-Brandenburg, and the pictures of Lucas Kranach; the college of the nobles, and the antiquities of the cloister. This town carries on a considerable commerce both by land and by water; and it reaps considerable benefit from the fishery on the Havel and the other streams and lakes by which it is surrounded. A great proportion of the inhabitants procure subsistence by the culture of hops, with which they brew an excellent beer, which is in great request not only in the town, but in the neighbourhood. There is besides a colony of French refugees in this town, who have established manufactures of woollen cloths, hair cloths, serges, stockings, canvass, linen cloths, fustians, &c. Brandenburg was erected by the emperor Otho I. into an episcopal see under the jurisdiction of the metropolitan of Magdeburg. This see was abolished, however, at the Reformation in 1563. The chapter, which has been since secularized, and which still subsists, is composed of a Lutheran provost, deans senior, sub-senior, and three other canons. The members of this chapter are distinguished by a cross of gold, enamelled with violet, and terminating in eight points; an honour conferred by Frederic II. In a fort, which is separated from the town by the Havel, there is a cathedral church, with re-

sidences for the members of the cathedral; and a riding school for the instruction of young noblemen. The municipal revenues of this town amount to about 60,000 rix dollars. Population about 1200. See Reichard's *Guide des Voyageurs*, v. 2. p. 311. (k)

BRANDON, a market town of England in Suffolk, situated on the banks of the lesser Ouse, which is crossed by an ancient bridge, on which there was a hermitage in 1406, belonging to the bishop of Ely. It carries on a considerable trade in corn, malt, timber, iron, bricks, &c. which is much facilitated by the river being navigable from Lynn to Thetford. There are very extensive rabbit warrens in the vicinity of the town. Number of houses in 1801, 203. Population 1148, of whom 1058 were employed in trade and manufactures. (j)

BRANDY, a spirituous liquor produced by the distillation of wines, is prepared in most of the wine countries of Europe. The principal manufactures of this spirit are in France, particularly in Languedoc and Anjou, from whence comes the well known Cogniac brandy. The apparatus for the distillation of brandy is extremely simple, and is composed of three parts: the *alembic*, a cylindrical copper boiler for containing the fermented wines, is enclosed in brick-work in the usual manner of fixed boilers, and furnished with a proper fire place, with a flue and dampers. It is about 28 inches in height, and 23 in diameter, and holds nearly 320 quarts. It is flattened at the bottom to present a larger surface to the fuel, and is drawn out into a neck about 2 inches high and 9 in diameter. To this neck is fitted the *capital*, which receives the spirituous vapour. It has the form of a flattened cone with the apex downward, and is about 17 inches wide at the base. It is truncated at the place where it joins the alembic, and where it has also a projecting tube of $1\frac{1}{2}$ inch in diameter, which conveys the vapour into the *worm*. This is a convoluted pipe immersed in a large tub of water to condense the vapour, and makes six or seven turns before it reaches the bottom. The diameter of this pipe gradually lessens from where it joins the capital to its mouth, where the liquor runs out, which is about one inch wide.

The liquor, from the time it begins to run off, gradually decreases in strength till the wine is entirely exhausted of spirit, and then it becomes almost tasteless, and is little better than water. From this inequality, a distinction is always made between the good spirit and the *petite eau*, as the French call it, or what is termed *feints* by the British distillers, which last is kept in separate casks, and redistilled in the next process. The precise time, however, of collecting the *feints*, is altogether arbitrary. In some places it is determined by the specific gravity of the spirit already run off. In Spain and Portugal, the sinking of olive oil in the liquor is the established proof; and others determine it by the proportion of brandy obtained to the quantity of wine put into the alembic. But this last proof, though frequently used, must be far from being correct, as the quantity of good spirit depends entirely upon the quality of the wines, and the produce varies from a third to a fifteenth of their weight. Strong heavy wines give the most spirit, and light thin wines, though well fermented, yield the least; and if the quantity of brandy be less than a sixth, it is supposed not to be worth the expense of distillation. In the extensive brandy distilleries of Catalonia in Spain, the wines generally used yield about a fifth part of olive-oil proof, and as much of feints for redistillation, and the general ave-

rage of product from the wines of the south of France is about a fourth.

The burnt taste which is common to most exported brandies, and considered by many as an excellence, is much disliked by the most delicate judges in the wine countries, and is supposed to be produced by boiling the wine with too much vehemence, or, according to Chaptal, by the decomposition of the *malic* acid contained in almost all wines, and which partly rises with the distilled spirit.

Brandies, distilled from the richest and fullest bodied wines, have in general a very unpleasant flavour, which is supposed to arise from an essential oil found most abundantly in such wines; and the most effectual method of destroying it is by adding a quantity of water, which separates the oil from the spirit, and a cautious redistillation.

Brandy of an inferior kind is also made from the *marc*, or refuse of the grapes after the wine has been extracted. This refuse still retains enough of grape juice to be brought into a state of fermentation, and it is estimated, that 32 cubic feet of it will yield about ten gallons of spirit. Considerable difficulties however, have been experienced in the distillation from *marc*; and great precautions are necessary in the regulation of the heat, to prevent the *marc* from adhering to the bottom of the alembic, which not only hurts the flavour of the spirit, but greatly injures the alembic itself. As a remedy for these difficulties, M. Beaume, in his experiments on distillation, recommends the immersion of the alembic in a water bath, which prevents every possibility of the *marc* being scorched; or, which is more convenient, the interposition of a wicker cradle between the *marc* and the alembic, about two inches from the bottom.

Though the juice of the grape has always been considered as the only fermented liquor from which this spirit could be properly distilled; yet it was discovered a few years ago by professor Proust, that brandy of an excellent quality might also be extracted from the fruit of the carobe tree, (*caroubier*.) This tree is very common in the eastern provinces of Spain, and has been

hitherto cultivated along all the coast of the Mediterranean merely as food for cattle. The spirit retains a slight odour of the fruit, but is in no way disagreeable to the taste; and the Professor found, that five pounds of dried fruit produced a quartillo (about the bulk of a pound of water,) of very good brandy.

Brandy, when it comes from the worm pipe, is pure and colourless as water; and the colour, which is given it by the merchants, is produced partly by the oaken casks in which it is kept, but chiefly by the addition of saunders wood, burnt sugar, and other colouring matters. These, however, do not in the least affect the quality of the spirit.

Various methods have been invented for proving the strength of brandy; but as all of them are of a general nature, and apply to other spirits as well as to brandy, they will be more properly introduced under the article DISTILLATION. One test, however, we may mention, which is confined entirely to this spirit, and was long considered by the brandy merchants, both in England and on the Continent, as the most infallible proof of the genuineness of brandy. By this they could not only distinguish French brandy from malt spirits, but likewise what was genuine from what was adulterated. The experiment is made by introducing two or three drops of a certain liquor into a glass of brandy; if the brandy be genuine, a beautiful blue colour immediately appears at the bottom of the glass, and when stirred tinges the whole of an azure; but if it be malt spirits, no such tincture is to be seen. By this means they also pretend to judge, by the various hues which it assumes, of the different degrees of adulteration. This liquor, which was considered as a grand secret, was discovered by M. Neuman, to be merely a solution of iron in a vitriolic acid; and he has shewn, by numerous experiments, that, as a test, it is both false and fallacious; as the effect is produced entirely upon the colouring of the spirit, not upon the spirit itself. See Aikin's *Dictionary of Chemistry and Mineralogy*; *Philosophical Transactions*, vol. xxxiii. p. 398; and Nicholson's *Journal*, vol. ix. p. 302. (p)

BRASIL.

A VAST region of South America, extending from the equator to the 33d degree of south latitude, and from the 35th to about the 56th degree of west longitude from London. It is bounded on the north by the river of the Amazons, which separates it from Portuguese Guiana; on the south by the Spanish settlement of Buenos Ayres, which prevents it from absolutely reaching the Rio de la Plata; on the east by the Atlantic Ocean; and on the west by the Spanish back settlements of Peru and Paraguay, from which it is separated by a rude and ill-adjusted boundary. So far as can be calculated from its imperfectly defined limits, it is 2300 miles in length and 1500 in breadth. This vast region is endowed by nature with the most exuberant fertility, and capable of every production by which the finest climates of the world are adorned and enriched. Its forests produce every variety of timber which can be employed either for ornament or use; and the bowels of the earth contain treasures more glittering, though less truly valuable. Gold and diamonds, the first of

the metals and of the precious stones, are produced more abundantly in Brasil than in any other region of the world.

Notwithstanding these vast capacities, however, Brasil, when first visited by Europeans, was almost a desert. Its vast plains were covered with impenetrable woods; and its subterraneous treasures were known only by the grains of gold dust occasionally washed down by the rivers. Over its wide extent wandered a multitude of scattered tribes, without agriculture, without arts, without government, and exhibiting human society in almost the rudest of possible forms. As it has always, however, been considered by philosophers an interesting object to trace the progress of man even in its earliest stages, the condition and character of these nations have attracted general attention, and may deserve to be exhibited at some length.

The physical constitution of the native Brasilians is generally represented as excellent. Open air, continual exercise without exhausting fatigue, and a simple diet, preserve them from most of the diseases to which Eu-

Europeans are incident. Notwithstanding continual exposure to the sun, the colour of their skin was not darker than that of the southern nations of Europe. It was very rarely that persons are to be seen among them with any bodily defect; but this circumstance, which is common to most savage tribes, may perhaps be accounted for in a way little flattering to their condition. The hardships and rapid migrations to which they are liable might be such as persons originally infirm could not survive; hence those only, whose constitution was originally sound and entire, were enabled to arrive at the age of manhood. In one respect, they were the rudest of all the American tribes. They went without any clothing whatever, even on those parts of the body which modesty most required should be concealed. They removed also all the hairs from their body, even those of the eye-brow and eye-lids, though the women retained that which grows on the head. To these habits they were so much attached, that all the efforts of Europeans to persuade them to make use of clothes proved uniformly fruitless. Even those who had been taken prisoners and employed in labour, though compelled by severe whipping to put on some articles of European dress, never failed, as soon as they were set at liberty for the evening, to throw them off as shackles, and enjoy themselves for some time in their original freedom. Although, however, they rejected all covering, they were not the less attentive to the embellishment of their persons. They painted their bodies with various colours, and covered them with grotesque ornaments of bone, shells, and feathers. The men painted their whole body except the face black, either for the purpose of concealment, or for rendering their appearance terrible to their enemies. Upon this ground, however, they drew layers of various ornamental colours. Among their favourite ornaments were necklaces and bracelets, made of bone or polished wood, which hung down upon their shoulders, and even their breast. War, or feasting, were the two great occasions on which they arrayed themselves in all this splendour.

This love of dress, as is usual among nations completely savage, was chiefly conspicuous in the male sex. The women, who were treated as inferior beings, and on whom most of the labour was devolved, had little opportunity or temptation to spend their time in adorning themselves. They used, however, the same species of ornaments as the men, with the exception of plumes, which are peculiar to the latter; and they shewed a peculiar avidity for every thing out of which necklaces could be made.

Their agriculture, though entirely rude, was however, from the excellent fertility of the soil, sufficient to maintain them in abundance. The day's work of one man is said often to have produced as much as would supply him with food during the whole year. The manioc, and other roots resembling it, were the substances chiefly cultivated. These, after being dried and reduced to powder, were boiled into a thick substance, which, after being cooled and preserved, bore a great resemblance to bread. When setting out on a war or hunting excursion, they boiled it till it became hard, and could thus be kept for a considerable time. All these offices fell to the lot of the females; and they too had the care of preparing that fermented liquor, in which these people were accustomed to indulge with the utmost avidity. The preparation was made in a manner sufficiently disgusting. After the roots had

been softened by fire, the women seated themselves round the pot, put the different pieces successively in their mouth, chewed, and then spit them into another vessel. This delicious pulp was afterwards boiled a second time, and being poured into earthen vessels, speedily fermented, and produced that liquor which formed the principal delight of savage banquets.

It has been currently asserted by travellers, that the Brazilians, differing from the most barbarous people, are wholly destitute of religious ideas. They are said to have no idea of a Divinity, no tradition respecting the origin of the human race, and no expectation of a future state of rewards and punishments. These assertions, however, are positively contradicted by the very travellers who make them, in other parts of their narrative. The Brazilians had, indeed, no temples, no sacrifices; none of that pageantry with which religious belief is usually accompanied among civilized nations. Neither had they ideas of the Deity, or of a future state, exactly corresponding to ours. Hence, to a superficial eye, they might appear destitute altogether of principles so deeply rooted in the human mind. But, on a closer examination, it soon appears, that they were fully impressed with the belief of powers and beings superior to man, and with that of a certain mode of existence beyond the grave. Their notions on these subjects were, doubtless, extremely rude and uncouth; but on this ground, the most civilized nations, unenlightened by revelation, could have little room to reproach them. The first objects which excite in untutored minds the idea of a superior power are, the great and active phenomena of nature, particularly those which move in the higher regions of visible space. Thunder, whose effects are every where striking, and peculiarly so in a warm climate, had attracted, in a remarkable degree, the adoration of the Brazilians. They had endowed it with mind, and viewed it, not only like other nations, as a formidable, but also as a beneficent, power. To it they considered themselves as indebted for whatever they knew of the science of agriculture. The sun and moon, almost universal objects of idolatrous worship, had also attracted their attention. At certain periods, they raised their hands to them in a suppliant manner, with gestures and cries expressive of the profoundest veneration. They had conjured up to themselves a race of evil beings, called Aignans, by whom they often fancied themselves to be beaten and scourged with the utmost severity. They entertained also notions of a future state. Some they believed were transported after death into plains of inexpressible beauty, where they spent their time in dancing, and were lavishly supplied with every means of enjoyment. The same traveller (Lery), who so inconsistently represents them as entirely devoid of religious ideas, mentions elsewhere his having heard one of their songs, in which, after lamenting the death of their ancestors, they console themselves with the hope of a future and joyful meeting beyond the lofty mountains. Others, on the contrary, are shut up in gloomy abodes, where the Aignans torment them without intermission. They were not even entirely destitute of a priesthood, some offices of which were performed by their jugglers or conjurers, who are supposed to possess powers more than human, and to hold intercourse with invisible beings. At their dances, which, at the same time that they afforded one of their highest enjoyments, were considered as religious ceremonies, several of these jugglers always presided.

During the intervals of dancing, the conjurer carried about wooden poles stuck round with fruits, and having a hollow filled with tobacco, which he set fire to, and breathed upon all present, pretending that through this medium the *spirit* infused force and vigour into them. Ridiculous as was this custom, it still seems to intimate a belief, not only of a superior, but of an immaterial being, with whom these uncouth ministers held intercourse. Besides presiding at these ceremonies, the conjurers were also believed to have the power of foreseeing, and even of producing future events: in cases of diseases, their aid was particularly sought. These supernatural powers, which they were believed to possess, made them be courted and caressed by all who laboured under any distress; but when the event did not correspond with the expectation of their votary, the failure was attributed to the conjurer, and he suffered often severe vengeance from his disappointed dupe.

Besides being without religion, they are represented also as having been without government; and this last allegation seems to have rested on a better foundation than the other. No nation seems ever to have subsisted in a more perfect state of equality, or with fewer outward marks of subordination. They had chiefs; but the small degree of obedience which they paid seems to have been so entirely voluntary, as hardly to imply any degree of subjection. To secure success in their warlike enterprizes, a leader was indispensable; and the bravest and wisest was naturally selected for that high office. As their expeditions were carried on rather by skill and stratagem than by open force, prudence and judgment were important qualities; and in a society where there was no other mode of acquiring information, except by experience, age necessarily involved a superiority; hence their old men were the chief objects of their respect. A peculiar reverence was paid to those who had distinguished themselves in war, by the number of men whom they had slain, or of the captives whom they had taken. These old men supported their influence by the arts of oratory, which made a powerful impression on savage minds. Their speeches were chiefly animating them to valour, and to revenge the death of their countrymen. They were particularly eloquent on their march to the scene of action, when the party often stopt for whole hours to listen to these rude harangues. With war, the slender portion of authority which its exigencies had conferred entirely ceased; and every one lived in his cottage, in a state of entire independence.

It thus appears, that war was the tie which united them in the bonds of political society: it was also their grand and favourite occupation; the object for which they existed. The inhabitants of Brasil were divided into a number of small communities, inflamed with the most deadly hatred against each other; the most ardent wish of each being the utter extermination of its immediate neighbour. The object of these wars, however, was not to extend their territories, which were already wide beyond their power to occupy; neither did the miserable plunder which a savage village afforded enter at all into their calculation. It was pure and deadly hatred; it was the raging thirst of vengeance, which nothing could appease, but the torture and destruction of its devoted objects. Enmities were propagated in an interminable series; for every act of vengeance called for new vengeance in return; every

instance of savage cruelty left an indelible recollection in the mind of the whole tribe to which *he* belonged, against whom it had been committed. This propensity was doubtless aided by that restlessness and desire of activity, which, in such fierce minds, could be gratified only by occupations of the most turbulent and tumultuous character. The love of military glory also, that favourite passion among all rude nations, entered largely into their motives to war. It was still subordinate, however, to their thirst of vengeance, and the desire of doing execution: the latter passion so far prevailed, as to make them adopt a mode of warfare, which has generally been deemed dishonorable by more civilized nations. They avoided to meet their enemies in the field; they never courted that single combat, which, in a nation governed by honour, is considered as bringing bravery to the fairest test. They conducted their wars by stratagem, by surprise, by ambuscade; they chose the dead hour of midnight to fall upon their unsuspecting enemies; they sought to destroy them, without exposing themselves to danger. This system, however, did not imply the want of courage; when perils met them, however formidable, they faced them with intrepidity; they endured, with the most dreadful constancy, those horrors, to which savage war exposes the vanquished. This care of themselves seems to have been dictated by the necessity of not diminishing the numbers of their tribes, since it was in numbers that its whole strength consisted; and these numbers being slender, would be materially diminished by the loss even of a very few members. This method had also the effect of rendering the blow struck against their enemies more sure and effectual; it prevented flight or resistance; it rendered their destruction sudden and entire. When one of their expeditions was determined upon, the old men arranged the time and mode of procedure; they gave the signal for setting out, and were followed by the rest, with the most rapturous acclamations. Having laid up provision sufficient to last for a considerable time, they proceeded by the most unfrequented paths, in profound silence, till they arrived at the hostile frontiers. There they left the women, children, and all those who were unfit for service; and the chosen warriors of the nation proceeded to the scene of action. When they approached the village on which the attack was to be made, they concealed themselves more carefully than ever. Taking their station in the thickest woods, they watched the opportunity of finding the enemy completely unprepared. The time favourable for this purpose was of course the night, when the enemy were buried in sleep, and unconscious of impending danger. Notwithstanding dreadful and continually repeated examples, these nations had never adopted the obvious precaution of stationing a centinel to warn them of an approaching enemy. The attack, therefore, proved generally successful; the inhabitants were roused from profound slumber by the yells of their destroying foe. A scene then ensued, the horrors of which no pen can describe. The victims, unprepared, unarmed, defenceless, fell unresisting into the hands of their enraged and unrelenting enemies. In vain did their cries rise to heaven; vain was all supplication; neither age nor sex afforded shelter from the utmost excesses of cruelty, and the victors exhausted themselves in inventing new forms of inhumanity; they devour in their fury portions of the mangled victims, while they reserve the survivors for a more lingering

fate. The number of prisoners taken was, indeed, the criterion by which their warlike exploits were chiefly valued. The arrival of a numerous band, doomed to destruction, secures them a joyful reception from that part of the community who had been left at home, and who were eagerly waiting their return. These unhappy men were reserved for a festival, the most horrible and the most disgraceful to human nature. To devour the flesh of their enemies, amid savage pomp and acclamation, was considered as the utmost height of human triumph. They did not, however, proceed immediately; nor did they, unless to a small extent, in the first frenzy of battle, feed on the bodies of enemies slain on the field. They reserved the living captives for an august solemnity, at which the whole nation was called to assist. Previous to this awful day, the prisoner was treated with every mark of kindness and favour. His wants were liberally supplied; he was allowed to accompany them in the exercises of hunting and fishing; and the person to whom he belonged hesitated not to give him one of his own nearest relations as a wife, during the short period that he had yet to live. All this previous kindness, however, seemed to be bestowed only to render his fate, when it arrived, more dreadful. Immediately previous even to the fatal moment, several days were devoted to feasting and profuse conviviality, in which the captive was admitted to share. All his study, then, was to shew the most entire indifference to his approaching fate, and the proudest defiance to the enemies among whom he was seated. He was the gayest of the company; he boasted aloud of his warlike exploits, and particularly of such as have been performed against those by whom he was surrounded. He was then fixed on a scaffold, and, by a whimsical indulgence, a number of stones were placed beside him, with which he was allowed to do all the mischief in his power. Then the person who was to execute his doom stepped forth. This office was considered as peculiarly honourable, and was assigned to the most distinguished character in the nation. This person comes in his most splendid war dress, waving with varied coloured plumes, and with a large club in his hand. He then addresses the captive: "Here am I, that have killed many of thy nation, and will kill thee:" to which the other replies, "You do well, I have slain a multitude of your countrymen and have devoured them; you do well, but my death will be revenged." After this mutual defiance, the fatal blow is instantly struck; and after the necessary preparations, the inhuman feast begins, amid universal delight and triumph. The bones are carefully preserved, and are fashioned into various ornaments of necklaces, bracelets, and musical instruments. The heads are also preserved, and piled up in a corner, to be shewn to every stranger, as testimonies of their prowess and success.

Their arms were necessarily imperfect, from their ignorance of iron; yet they had called forth the utmost exertions of savage ingenuity. The most important was, a species of club, called *tacape*, formed of Brasil wood, or of a species of black ebony, very weighty, round at the extremity, and sharp at the sides. It was six feet long, and about an inch thick. They had shields made of skins, broad, flat, and round. For missile weapons, they had arrows, composed of the same hard wood with their clubs. The strings were made of a particular species of grass, and twisted so strongly, that a

traveller declares a horse might draw by them. Their arrows were six feet long; the head and point formed of black wood, the middle of common wood, and these different pieces are very neatly joined with thin bark of trees. They had two pennons, each a foot long, neatly tied with cotton thread. They were pointed, either with bone, with hard and dried canes in the form of a lancet, or with the tail of the ray fish, which has a strongly poisonous quality. They had also a certain species of military ensigns, and drew a warlike music from flutes made of the bones of their enemies.

Although they preferred the mode of warfare by ambuscade, yet, in case of necessity, they hesitated not to meet their enemies in the open field; and a most extraordinary spectacle then ensued. A French traveller, who was an eye witness of one of these combats, has given a very curious and lively description of it, which we shall translate for the use of our readers, preserving, as much as possible, the *naïveté* of the original.

"Having been myself a spectator," says Lery, "I can speak with truth. Another Frenchman and I, though in danger, had we been taken or killed, of being eaten by the Margajas, had once the curiosity to accompany our savages, then about four thousand in number, in a skirmish which happened on the sea coast; and we saw these barbarians combating with such fury, that people mad or out of their senses could not do worse. First, when our people had perceived the enemy at about half a quarter of a league's distance, they took to howling in such a manner, that though it had thundered in heaven we should not have heard it. According as they approached, redoubling their cries, sounding their drums, stretching their arms, throwing out dreadful threats, and showing to each other the bones of the prisoners whom they had eaten, and even their teeth strung together hung round their neck: it was horrible to see their countenance; but it was much worse when they came near each other; for, when at the distance of two or three hundred paces, they saluted each other with great showers of arrows; and by the first discharge, you would have seen the air entirely loaded with them. Those whom they struck tore them from their body with wonderful courage, broke them, bit them with their teeth, and failed not to make head in spite of their wounds; upon which we must observe, that these Indians are so furious in their wars, that so long as they can stir legs or arms, they cease not to combat, without retreating or turning their backs. When they were joined in battle, you might then see them wielding, in their two hands, wooden clubs, and charging so furiously, that he who met the head of his enemy, not only threw him on the ground, but felled him, as butchers do oxen. You will ask what my companion and I did during this rough skirmish? To conceal nothing, I answer, that, satisfied with our first folly, which was to risk ourselves with these barbarians, and keeping in the rear, we were only occupied in viewing the blows. But though I had seen men at arms in France, both on foot and horseback, I must say, that the polished movements, and glittering armour of our Frenchmen, never gave me so much pleasure as I had then in seeing the savages combat. Besides their leaps, their hissings, and their skilful thrusts, it was a wonderful spectacle to see flying in the air so many arrows, with their great pennons of plumes, red, blue, green, carnation, and other colours, amid the rays of the sun, which made them glitter, and to see also

so many helmets, bracelets, and other ornaments, made of these natural plumes, with which the combatants were covered.

"After the combat had lasted about three hours, and that there had been a good number killed and wounded on both sides, our Topinamboux having at last gained the victory, made prisoners of more than thirty Margajas, men and women, whom they carried away into their country; and although we two Frenchmen had done nothing but hold our naked swords in our hands, and fire some pistol shots in the air to encourage our men, we saw that it was impossible to do them a greater pleasure than to go to war with them; for they esteemed us so much afterwards, that, in the villages which we frequented, the old men always testified more friendship to us.

"The prisoners having been placed in the middle of the victorious band, bound, in order to secure them the better, we returned to our river of Janeiro, in the neighbourhood of which these savages inhabited. As we had gone twelve or fifteen leagues, ask not, if, in passing through the villages of our allies, they came not out to meet us, dancing, leaping, and clapping their hands, to applaud and caress us. The poor prisoners were obliged, according to their custom, when they were near the houses, to sing and say to the women, 'here is the food which you love so much coming to you.' To conclude, when we were arrived before our isle, my companion and I went into a bark, and the savages went away, each to their residence."

In order to guard against the attacks with which they were constantly threatened, the Brasilians were accustomed to fortify their villages. The interior inclosure was composed of a strong pallisade, before which was thrown up a wall of loose stones. The houses were pierced with holes, through which arrows could pass. A Portuguese force which attacked one of these forts found its reduction extremely difficult. In consequence of the furious sallies of the Indians, they were obliged to entrench themselves, and wait the arrival of succours from the metropolis. Having covered themselves, however, with hurdles of canes, which secured them against arrows, they at last forced the walls, and became masters of the place.

This desperate ferocity, with which the wars of these savages were conducted, might naturally lead to the expectation, that their domestic intercourse would present a similar scene of violence. Here, however, a remarkable contrast was presented. Although there existed no regulations for securing internal tranquillity; although the chiefs possess no power, unless in war, and never interfere in private quarrels; yet no bad consequences are felt; the most perfect peace, the most profound harmony, reigns in all their villages. A traveller, who resided more than a year among one of the fiercest of these tribes, was witness, during that time, only to two quarrels. In their sickness, they received from each other the most tender attention; and all the offices of friendship were mutually performed with zeal and fidelity. This internal union, so remarkably superior to what would be found among the most polished nations, if freed from the restraint of law, seems derived, in a great measure, from the fierceness of their animosity against their neighbours and enemies, and the continual danger to which they were exposed from them. A common sentiment of fear and hostility, diffused through all the members of the society, proves the most powerful

bond of union between them. In these wild and ardent natures, the sentiments of attachment and tenderness are as strong as those of hatred and vengeance; and all the force of the latter being turned in another direction, the former alone are felt towards their kinsmen and countrymen. To avenge such of these as had been the victims of the barbarous ferocity of their enemies, was the motive which, rankling continually in their minds, impelled them to such incessant and dreadful warfare. When the orators wished to animate their valour, it was by reminding them of their relations, who had been slain and devoured by the tribe against whom their arms were directed.

The laws of hospitality have always been held in peculiar veneration among rude nations. The rare appearance of travellers, the helplessness of their situation, and the absence of all motives to enmity against them, excited that natural disposition to kindness which exists in these tribes, when not embittered by the belief of real or imagined wrongs. This law of hospitality was established in full force among the Brazilian tribes. The stranger was received, not only with kindness, but with rapture, and was loaded with every distinction which it was in their power to bestow. When a stranger arrived at a village, he chose the person with whom he was to lodge, who was called his *moussacat*; and, in all future visits, he must choose the same person, by whom his going to any other would be considered as a serious affront. As soon as he entered, the women crowded round him with the most flattering expressions of kindness and of gratitude for his having taken up his abode in their house. The master of the dwelling then stepped forward, and received him with a graver welcome. Was he hungry or thirsty, the best that the house contained was prepared and set before him; and his hosts stood round in a circle, to keep off the children, or whatever could occasion disturbance. At night, the best hammock was spread for him; and, with even superfluous attention, small fires were kindled near it, and kept up during the night; on the morning, the host was at hand to inquire how he had slept. In short, a traveller declares, that he felt more secure among the savage Brasilians, than among his countrymen at home, who were then torn with religious dissensions.

In their domestic manners, and the intercourse between the sexes, the Brasilians were far from being disolute. The unmarried females, indeed, were under little restraint, though this we suspect to have been chiefly in regard to Europeans, to whom the same rules of morality were not, among the inhabitants of the New World, supposed to apply, as to their own countrymen. After marriage, however, the most rigid propriety of behaviour was observed. A savage custom required of every man, as a necessary preliminary to his entering into that state, to have first taken a captive, and given him to the nation to be devoured. Marriage could be dissolved at pleasure, and polygamy was considered lawful, though it was practised only by a few of the chiefs. Notwithstanding the entire want of covering, the utmost decency was observed in their outward deportment.

The vice of intoxication is very general among savages. The vacuity of their minds, the want of regular amusement and occupation, makes them eagerly grasp at whatever can give an impulse to the animal spirits. The Brasilians had invented a species of fermented liquor, the manner of preparing which we have described

above; and they indulged in it with an excess and fury of which civilized nations can with difficulty form an idea. Days and nights were consumed in the gratification of this propensity; and so long as a drop remained, they never desisted. Lery, after enumerating all the nations most noted for drinking, calls upon them to yield the palm to the Brazilian savages.

On fixed days, they assembled for the purpose of dancing, which, as formerly observed, served at once as an amusement, and as a religious ceremony. It was practised in a manner extremely singular and uncouth. The men, women, and children, formed three separate parties, who were each placed in a house by themselves. They began with wild howlings, which were soon followed by softer and sweeter notes; they then arranged themselves into circles, and without moving from the spot, placed themselves in a variety of attitudes, mixed with leaps and gestures. In the midst of each circle stood a juggler, who performed a multitude of superstitious ceremonies, which have been described under the head of religion. They were continued usually for six or seven hours.

The Brazilians lived in villages, two or three of which constituted a nation. In each village there were only three or four houses; but these structures were extended to a great length, and contained sixty or seventy families. Each family had a certain space allotted to it, but without any partition to separate it from the rest. One village, seen by a traveller of the name of Knivet, though consisting only of four houses, arranged in the form of a square, was estimated to contain 4000 inhabitants. The interior of these houses presented a singular spectacle, from the multitude of human beings crowded together, with their arms, implements, and grotesque ornaments, irregularly disposed. The outside was covered with grass and shrubs.

A traveller has given us some specimens of their language, which, like all savage dialects, is extremely concise. The tenses of their verbs are as numerous as those of most other languages; and they have even the optative mood, which is wanting in the Latin, and in the languages of modern Europe. These tenses, however, are formed, not by inflexions of the verb, but by particles added. Thus *Aiont*, I come; *Aiont aquoémé*, I came (*veniebam*); *Aiont aquoéméne*, I came (*veni*); *Aiont vien*, I will come; *Aiont momen*, would I could come. They had no names for numbers above five; if they wished to express any higher, they pointed to their fingers; or, if these were insufficient, collected the fingers of the bystanders, till they amounted to the proposed number.

The Brazilians were divided into an immense variety of tribes, many of which have been enumerated by different travellers. Our readers, however, would not, we presume, think themselves obliged to us for calling over a roll of barbarous appellations. There were several races, however, which, while they retained a common name, had branched out into a variety of different tribes. Of these the most noted were the Taperyas and Topinamboux. The former were chiefly found on the northern frontier, though they had extended themselves along the whole coast of Brasil; the latter had their chief settlements in the bay of St Salvador. The Molopagues and Motayes had established themselves on the river Paraiba, in the captainship of Spiritu Santo. There were minute shades of difference in the character and habits of all those people; but the general as-

VOL. IV. PART II.

pect which they all presented was very nearly the same.

Brasil was not among the first discovered countries of the new world. Columbus, in his search after the East Indies, then accounted the grand source of wealth, landed first among the islands in the Gulf of Mexico; and having once formed an establishment there, he made it the centre of his farther discoveries. He contented himself therefore with exploring the coasts of the continent around that gulf; and when, in his third voyage, he had proceeded as far as the Oronooko, and had landed on the island of Trinity, he immediately measured back his steps. After the golden treasures of Mexico and Peru had opened themselves to Spanish avidity, the efforts of adventure were entirely turned in that direction; and it was left to chance to discover all the other regions of the new continent. Chance accordingly led Europeans into Brasil. There are some intimations of Vincent Yanez Pinzon, one of the companions of Columbus, having touched on the coast in 1499; where, however, he was prevented from landing by the ferocity of the inhabitants. The solid discovery of Brasil, however, was made in the following year by Pierre Alvarez Cabral, a Portuguese navigator. Vasco de Gama having, by doubling the Cape of Good Hope, opened a new way to the East Indies, Cabral was dispatched with a considerable squadron to improve this discovery, and to form a settlement in these celebrated regions. The discovery of the compass had now emboldened navigators to venture far into the open sea; and Cabral, wishing to avoid the calms which reign along the coasts of Africa, steered so far west, that on the 24th April 1500, he came in sight of an unknown coast; and after sailing along it for a considerable space, reached a harbour, the commodious appearance of which tempted him to land. He called the country Santa Cruz, (the Holy Cross,) and the harbour Porto Seguro; and then, according to that ill authorised right which Europeans had assumed to themselves, he took possession of the whole in the name of his master. The natives were at first alarmed, and fled to their hills; but the Portuguese, having secured two, presented these with mirrors, brass rings, and bells, which were found to be the ornaments most agreeable to them. Cabral then allowed them to rejoin their countrymen, whose fears were immediately dissipated by this friendly behaviour, and who flocked to the vessel with as much delight and confidence, as they had formerly testified suspicion and aversion. They approached singing and dancing, with all the uncouth gesticulations of savage joy; and an intercourse was immediately opened between them and the Portuguese. Clothes, however ornamental, were found to be of no value in treating with a people who considered the wearing of them as an intolerable hardship; but every article which was capable of being converted into bracelets, necklaces, and other fantastic ornaments, in which they delighted to array themselves, was eagerly prized. In return, the Portuguese received cotton, maize, ornamental woods, and a variety of rare and beautiful birds. Although there was yet no appearance of those treasures which were chiefly prized by European cupidity, and which Brasil was afterwards found to produce in such abundance, yet the extent of the country, its beauty and evident fertility, gave it such importance in the eyes of the Portuguese commander, that he immediately sent back one of his vessels to Europe, to give a report of his new discovery. Emanuel, the most illustrious and

3 F

renowned of the Portuguese monarchs, was then seated on the throne; and though his views were chiefly directed towards conquest in the East, yet the addition of so extensive and fine a country to his dominions, could not fail to excite his ambition. Navigators were therefore sent to explore its coasts; and settlements were formed on different parts of their wide extent. It was soon discovered, however, that the sanguine hopes of wealth, which the first settlers carried out with them, were little likely to be realized. Gold and silver were no where to be seen: and though the land was profusely fertile, it was totally uncultivated; nor could it be cleared and brought under cultivation, without enormous labour. Parrots indeed and coloured woods might be had unbought, and yielded a considerable profit in Europe, where they were yet rare; but these articles could not be made the foundation of any extensive commerce. What completed the disgust of Europeans at this new territory was, that their slender profits could be earned only by encountering the most formidable dangers. The harmony which had reigned at the first interview between the natives and Portuguese was soon interrupted. The former, we may well believe, found little reason to congratulate themselves on the acquisition of these new neighbours; and passing, with the impetuosity of savage minds, from the extreme of attachment to that of hatred and vengeance, they commenced a furious warfare on the European settlements. Savage valour, even without discipline, rendered the encounters desperate and bloody; the Portuguese were not always victorious; and for those who fell into the hands of the enemy, was reserved a fate at which humanity shudders. Such occurrences soon put an end to voluntary emigration into Brasil; all who pursued the prizes of wealth and ambition, crowded to the more splendid theatre of India, every region of which was then the theatre of Portuguese triumphs. Brasil seemed likely to revert into its original state of desertion; but the Portuguese court, anxious by any means to make something of their acquisition, adopted the scheme of peopling it out of the refuse of the mother country. Wretches, who had forfeited their life to the laws, were, in mitigation of punishment, sent to this new colony: a destination which, as matters then stood, was considered rather as a reprieve from death, than a final deliverance. The Inquisition had just been established in Portugal; and that barbarous tribunal, by creating a variety of factitious crimes, had augmented in an extraordinary degree, the number of persons amenable to the laws. From such causes, the population of Brasil was gradually augmented; settlements were formed in different parts of the coast; and the new planters, doomed alternately to wield the ploughshare and the sword, became a fierce and hardy race, fitted to contend with the difficulties of their situation. The Indians, wrought to the highest pitch of exasperation, exhausted on their invaders all the furies of savage war; while the latter, as if fearing to be outdone, committed atrocities, not perhaps surpassed by those, by which their more celebrated neighbours had marked their conquest over the golden regions of Mexico and Peru. By the relations of travellers which have been handed down to us, it appears to have been their regular practice on storming a savage village, to put to death the old men, children, and all who could be of no use; and to carry the rest into slavery. In process of time, the skill and discipline of the Portuguese prevailed over the savage fierceness of their

opponents; plantations were extended, and the sugar cane being introduced from Sicily and Spain, succeeded in a wonderful degree, and brought large profits in the markets of Europe. The attention of the Portuguese court was at length arrested by the flourishing state of its new colony; and it began seriously to consider, how the greatest advantages could be derived from it. The former contempt, however, in which this settlement was held, had led to measures, which threatened to frustrate the hopes now entertained from it. A grant of land, even on the most extensive scale, had been thought of so little value, as to be readily bestowed on any one who thought it worth the asking. From this reason, almost the whole of that fine settlement had been alienated from the crown, and was in the hands of different individuals. The remedy applied by John III. who now reigned in Portugal, was more conformable to the maxims of state necessity, than to the strict rules of justice. In the year 1549, he revoked, without ceremony, all the grants that had been made by himself or his predecessors; and having equipped a fleet of six vessels, with a number of troops and officers, he gave the command of it to Thomas de Sousa, who went out with the appointment of governor general. He established his capital at St Salvador, in one of the noblest and most beautiful bays in the world, with an admirable harbour, and in the richest part of Brasil. Six Jesuits went out along with the fleet, for the purpose of converting the natives; and the judicious and benevolent labours of these missionaries were not altogether unattended with success. The increase of force, and the regular establishment of law and government, which were the result of these measures, were efficacious in fixing and extending the prosperity of the colony. This very prosperity, however, exposed it to new dangers. The other European powers, all alive to the advantages that were to be derived from establishments in the new world, saw in the wealth and defenceless state of this vast territory, an opportunity of gratifying their ambition. Civil war and religious persecution, which then raged throughout all Europe, produced a vast multitude of refugees, who were anxious to find shelter at the greatest possible distance from their native country. France, accordingly, which was the peculiar theatre of these calamities, was the first country which contested with the Portuguese the possession of Brasil.

Durand de Villegagnon was a knight of Malta, and high in the French naval service; but having embraced the opinions of the reformers, and being disgusted with some treatment which he had experienced from his government, he conceived the design of forming a Protestant establishment in the new world. He held out to the French court the mere plan of founding a colony, after the example of the Spaniards and Portuguese. Through the interest of the Admiral de Coligny, who regarded him with favour, and had secretly embraced the same opinions, he obtained the concurrence of Henry II. in this undertaking. He procured two or three well equipped vessels, and having filled them with persons of his own persuasion, set sail for Brasil. He landed at the Rio Janeiro, where he settled his people, and began to build a fort, which, after the name of his patron, he called Fort Coligny. Here he found some Normans, who had been thrown by shipwreck upon the same coast, and, having lived some time with the savages, were qualified to act as interpreters. He then sent back his vessels to receive a new cargo of Protestants. He transmitted formal dispatches to the French king;

but those which he wished to be acted upon, were sent to Coligny and his friends at Geneva. A great zeal was immediately kindled for the extension of Calvinism into these remote regions: two ministers, and fourteen students from Geneva, determined to brave all the hardships of an unknown climate, and of a mode of life wholly different from that to which Europeans were accustomed. They repaired to the admiral's seat near Chatillon sur l'Oing, where they were received with the highest distinction. The influence of Coligny, and the uneasy situation of the reformers in France, soon swelled their numbers; and on their road to the place of embarkation at Rouen, new recruits continually presented themselves. Their departure was precipitated by an adventure of no agreeable nature. It having transpired, that they had exceeded the very narrow bounds of the toleration which the law allowed, the Catholic inhabitants of Harfleur, influenced by the most furious intolerance, rose in arms against them; and a desperate conflict ensued, in which one of their best officers was killed, and the rest were saved, only by setting out instantly, and under these disastrous circumstances, for the place of their destination.

A violent storm which this expedition met with on its passage, struck with consternation the majority of the passengers, who had not been inured to the sea. After a long delay, however, they arrived off the coast of Brasil, at about the tenth degree of south latitude. They proceeded along the coast, and after a slight encounter with the Portuguese at Spiritu Santo, reached at length the settlement of their countrymen on the Rio Janeiro. Here they were received with apparent cordiality; but after the first welcome, they experienced nothing but hard fare and hard labour, which few of them, it is probable, were fully prepared to encounter. The Protestant rites, however, were now for the first time celebrated, and with every appearance of zeal and satisfaction on the part of Villegagnon. The Portuguese, meanwhile, seem to have made no efforts to dislodge these intruders, thinking, perhaps, that there was room enough in the country for both. The advantage of this forbearance, however, was entirely lost to the new colony, in consequence of its own internal dissensions. We have only the narrative of Lery, who was one of those newly arrived; but as his statement was never contradicted, considerable credit is attached to it. Villegagnon, it appears, after having founded his colony upon the basis of Protestantism, began himself to entertain doubts upon the most essential principles of that creed. He cherished peculiar scruples upon the subject of the real presence; and though he could not believe that Christ was really present in the sacraments, yet neither could he be satisfied that he was not. He began also to suspect that the wine ought to be diluted, and that salt and oil ought to be mingled with the water of baptism; and having introduced innovations conformable to those opinions, he soon excited a violent discontent among his followers. Those newly arrived from Geneva, in particular, who were imbued with the most rigid principles of Calvinism, wholly declined participating in these new rites, which they accounted to be rank Popery, and clandestinely celebrated the sacrament during the night, as was done by their persecuted brethren in France. Villegagnon, on discovering these proceedings, was extremely chagrined, and mutual irritation, daily increasing, rose at length to such a pitch, that he resolved to expel them entirely from the fort, and force

them to return to their native country: declaring, that if their arrival had caused him much satisfaction, their departure was still more agreeable. The unfortunate Genevese were forced to embark on board a vessel in a very bad state of repair, as well as insufficiently supplied with provisions. Through the ignorance of the pilot, the voyage was prolonged considerably beyond expectation; and the crew were destined, in consequence, to experience the utmost extreme of human misery. Long before their arrival off the coast of France, their stock of provisions failed; and they were assailed by hunger in its most direful form. Their situation is painted in so lively a manner by one of the sufferers, that we shall translate some passages of his narrative. "After having devoured," says he, "all the leather in our vessel, even to the covering of the trunks, we thought ourselves approaching to the last moment of our life; but necessity suggested to some one the idea of pursuing the rats and mice, and we had the greater hope of taking them easily, because, having no more crumbs, nor any thing to devour, they ran in great numbers, dying of hunger, through the vessel. We pursued them so carefully, and by so many kind of snares, that very few remained. Even in the night, we sought them with our eyes open, like cats. A rat was more valued than an ox on land. The price rose so high as four crowns. We boiled them in water, with all the intestines, which were eaten as well as the body. The paws were not omitted, nor the other bones, which we found means to soften. The extremity was such, that nothing remained but Brazil-wood, the driest of all woods, which many, however, in their despair, attempted to chew. Carguilleray du Pont, our leader, holding one day a piece in his mouth, said to me with a deep sigh, Alas! my friend, I have due to me in France a sum of four thousand livres; and would to God that, after giving a discharge for the whole, I held in my hand a pennyworth of bread, and a single glass of wine." Several died of hunger; and they had already begun to form the resolution of devouring each other, when Rochelle appeared in view. They landed; but a number having, after this long abstinence, devoured food with too eager avidity, perished soon after.

Concerning the subsequent fortune of Villegagnon, who appears to have been so ill qualified for the task which he had undertaken, we have few details. After having thus preposterously reduced his strength, he found himself unable to contend with the Portuguese, who at length bestirred themselves in order to expel this heretical colony from their settlements. Villegagnon evacuated the fort on their approach, abandoning the cannon which he had placed on it. The Portuguese thus reaped all the fruits of the French attempts to colonize Brasil; and found established for them a settlement, which they have since erected into the capital of this flourishing colony.

Brasil, however, was too valuable to be left in the undisturbed possession of any one nation. The Portuguese had soon a more formidable and persevering enemy to encounter. In consequence of the rash and fatal expedition of Sebastian into Africa, the immediate heirs to the throne of Portugal failed; and several claimants having started up, Philip II. of Spain, through the great superiority of his power and influence, easily secured the preponderance. Portugal was thus annexed to his dominions. The intolerance and cruelty of Philip, meanwhile, had involved him in a long and cruel war with

Holland and the neighbouring provinces; while the efforts to which the latter had been impelled by their zeal in the cause of civil and religious liberty, had raised them to the first rank among maritime powers. The foreign possessions of the crown of Spain were then considered of course as their lawful prey; and the convenient situation and other advantages of Brazil, naturally attracted their attention towards that settlement. In 1621, they had formed a West India company, invested, like all the commercial bodies established at that period, for these distant undertakings, with exclusive privileges. In consideration of this boon, the company undertook to carry on the concerns of war, as well as of trade, in these remote regions. In 1624, they fitted out a considerable armament, which they entrusted to Willekens, one of their most esteemed naval commanders. The success of the expedition was prompt and complete. They landed at St Salvador, the governor of which did not even attempt resistance; all the inhabitants either fled or submitted, and the accumulated wealth of ages fell at once into the greedy hands of the commercial invaders. The whole province followed the example of the capital.

The Portuguese were struck with the deepest consternation, when they learned the disaster which had befallen their country. Their grief was augmented by the strong suspicion which they entertained, that it would be a subject of gratification at the Spanish court; that the humiliation of a people, who submitted with evident reluctance to the Spanish yoke, would, in its eyes, more than counterbalance the loss which had been sustained. If, however, Philip secretly indulged these sentiments, he did not allow them to influence his outward conduct. He sent letters to all the principal Portuguese nobility, urging them to exert themselves in order to retrieve this disaster; and he ordered a Spanish armament to be prepared for the purpose of co-operation. The Portuguese exerted themselves with remarkable zeal, at once to support the honour of their nation, and to disappoint the malignant hopes which they imputed to Spain. In less than three months they had equipped a fleet of twenty-six vessels, with a large force on board, both naval and military; but the tardiness of the Spanish preparations delayed their sailing till the month of February 1626. The whole was commanded by Osorio, Marquis of Valdesa; and the number embarked, including soldiers and sailors, amounted to upwards of twelve thousand.

Meanwhile events in the colony had prepared the way for their success. After the governor and regular force had yielded without any resistance, the archbishop, Michael Texeira, animated by an heroic spirit, rallied round him his clergy and the persons attached to him. With these he retired and fortified himself in a neighbouring post; multitudes flocked to his standard; his strength augmented daily; and from defending himself, he was soon enabled to become the assailant. He began by cutting off the Dutch parties and detachments; he intercepted their supplies of provisions; and he at length succeeded in placing the city under a complete state of blockade. His death, which unfortunately occurred, did not prevent his successors from persevering in the same system. By the time, therefore, that the Portuguese fleet arrived off St Salvador, the place was reduced to considerable straits; and when Osorio had landed 4000 men to co-operate with those already in arms, its situation became entirely desperate. The governor made some attempts at resistance; but these were rendered

ineffectual by the inhabitants, who loudly demanded an immediate surrender. The fleet returned in triumph to Europe.

The Dutch company were inflamed with the most eager desire of repairing this loss and disgrace; but the deficiency of their resources obliged them to delay an expedition necessarily attended with enormous expense. They attacked, however, with the utmost vigour, the Spanish and Portuguese vessels in the European seas, as they returned from the East and West Indies; their success was prodigious; and immense wealth was the result of this species of warfare. In thirteen years they had taken five hundred and forty-five vessels, the proceeds of which amounted to 7,500,000*l*. The equipment of the privateers employed had cost only about half that sum; so that they were enabled to divide never less than twenty, and sometimes even fifty per cent. on their capital. These funds soon placed them in a condition to undertake a new expedition into Brasil. About the middle of 1629, twenty-seven vessels were equipped and sent out under the command of Admiral Lonk. These, collecting all the Dutch vessels they met, swelled gradually to forty-six, which, after a somewhat long navigation, arrived on the 3d of February 1630, off the coast of the fertile province of Fernambuco. Wardenberg, who commanded the troops, landed at the capital Olinda, which he immediately attacked. The Portuguese, however, no longer reposing in their former security, gave him a warm reception. Three forts defended the city, of each of which he rendered himself master, only by a sanguinary contest; and he was obliged to call in the aid of the naval force, in order to complete the reduction of the city. When this success, however, was completed the whole province, struck with consternation, submitted to the victors. The Portuguese a second time learned, that this settlement, so much valued, was on the point of being wrested from them; the nation again strained every nerve to recover it; and they were again seconded, though more coldly than ever, by the court of Spain. However, a considerable armament was equipped, which might have effected its object, had not an infectious disease seized the troops before their departure. Two thousand perished; and the rest, dreading the same fate, fled from the scene of pestilence. The deserters were compelled to return, and the fleet was again prepared for sea; but these distressing events delayed its departure till the month of May in the following year. The Portuguese, collecting all their naval force, both in Europe and Africa, assembled a fleet of fifty-four vessels, which was considerably superior to any which the Dutch were able to oppose. The latter, not aware of the strength of the enemy, sailed from their harbours with only sixteen vessels. Accustomed, however, to despise the Portuguese, they hesitated not to engage even against such fearful odds; but they paid dear for their rashness. The admiral was blown up with his vessel; the second in command shared the same fate; yet the bravery of the Dutch still saved them from total defeat, and they made an admirable retreat to Olinda, carrying with them a Spanish vessel, of which they had made prize. The Portuguese admiral did not derive any decisive result from this success, or from his naval superiority. He contented himself with landing twelve hundred men to reinforce the Portuguese army under the command of Albuquerque: and having provided for the security of the capital, and of the province of Sergippe, he again set sail for Europe. Another expe-

dition, dispatched next year, under the command of Don Frederic di Toledo, was still less productive of any serious injury to the enemy. The Dutch continued to make progress in Brasil, notwithstanding the bravery of the Portuguese generals, and the assistance the latter derived from the natives, whom they had now completely attached to their interests. The Dutch, in three successive campaigns, completed the conquest of the provinces of Tamaraca, Paraiba, and Rio Grande, and were thus masters of all that part of Brasil which lies north of the river Francisco. These successes inspired their government at home with the hope, that, by a great effort, they might complete the conquest of Brasil. Prince Maurice of Nassau, equally distinguished for birth and for military talents, was put at the head of the armament. He arrived in October 1636, and joining his troops to those formerly in Brazil, immediately took the field. He entered the province of Sergippe, which had hitherto been untouched; he defeated the Portuguese commander Banjola, in several successive engagements; and at length made himself master of the capital and of the whole province. At the same time he reduced successively the strong holds which the Portuguese still retained in the districts north of Olinda; and he obtained a voluntary submission from the still more northerly province of Siara, which was then almost entirely in the possession of the natives. Brasil however, was not conquered till the Dutch were masters of the capital. Prince Maurice, accordingly, marched to St Salvador, and laid siege to it; but the Portuguese, who considered this place as their last hope, had omitted nothing to put it in a respectable state of defence. After the prince therefore had carried by storm three forts which defended the city, on attempting to storm the place itself, he was repulsed with great loss; and a reinforcement, immediately after, arriving from Portugal, he found himself under the necessity of raising the siege.

In the following year (1639), extraordinary efforts were made by the two crowns to regain entire possession of this valuable settlement. Forty-six vessels, with five thousand troops on board, were dispatched under Fernand de Mascarenhas, a gallant and distinguished officer. Sickness, however, the usual scourge of Portuguese naval operations, attacked this armament, as it sailed along the coast of Africa; half the troops perished, and the rest arrived in a melancholy condition at St Salvador. Mascarenhas, however, by extraordinary exertions, collecting all the force which could be found in the country, formed an army of 12,000 men, which he embarked on board the fleet, and sailed against Olinda. Maurice had not been inactive in preparing for defence. Having received reinforcements from Holland, he expected Mascarenhas with forty-one vessels, well manned and equipped. A most furious engagement ensued, which lasted four days; and though, in the first, the Dutch admiral, Loos, was killed, yet victory remained with the prince. In the following days, his success was still more decisive; the Portuguese fleet was entirely dispersed; great part of it perished upon rocks; and of that mighty armament, only six vessels returned to Spain. The Portuguese troops, meanwhile, had taken advantage of this diversion, to enter Dutch Brasil; and being seconded by the Brasilians, under the command of a brave chief, Cameron, they gained considerable advantages, and committed great devastation. As soon, however, as prince Maurice had disposed of the naval

armament, he was easily able to put a stop to these inroads, while the Dutch navy rode triumphant in the bay of St Salvador. Yet, after all these successes, the prince was too weak to entertain any hopes of effecting the entire conquest of Portuguese Brasil; and both parties being tired of the calamities occasioned by so long a war, a negotiation was entered into for a suspension of hostilities; and while it was in progress, the event was accelerated by important changes which had taken place in the mother country.

Time had in no degree reconciled the Portuguese to the Spanish yoke; a succession of new injuries and sufferings kept their hatred continually alive. Among the grounds of their animosity, none lay deeper than the loss of Brazil; a calamity to which they would never have been exposed, had they not, by their union with Spain, been involved in the war which that nation carried on against Holland; and the apathy which the Spanish court was supposed to have discovered, both in regard to its preservation and recovery, heightened this resentment into fury. The whole nation, therefore, was ripe for a revolution, by which they might shake off the Spanish yoke; the duke of Braganza, whom they regarded as the rightful heir, resided in the kingdom; and the ministers of Philip IV., either from weakness, or from a doubtful policy of fomenting rebellion, in order to obtain pretences for oppression and confiscation, took no effectual measures to guard against the threatening danger. It would be departing from our subject to enter into any detail of the steps by which the independence of Portugal was established, and the house of Braganza placed on the throne. The nation unanimously took up arms; but they were thus involved in a long and severe struggle with the military power of Spain, which was still ranked among the most formidable in Europe. In these circumstances, the preservation of national independence becoming the most urgent object, it was necessary to postpone any attempts at the recovery of Brazil. The Dutch, from enemies, became the most hopeful allies in this new contest; and the present was no time to irritate or attack them in any quarter. A treaty of peace and alliance was therefore concluded between the two nations, by which it was stipulated, that the limits of Dutch and Portuguese Brazil should remain as they then stood. This treaty was signed on the 23d June 1641. The Dutch, now conceiving their Brazilian possessions to be in the most profound security, thought only of reducing the enormous expence of the establishment. With this view, they recalled prince Maurice, who, with all his talents for war and government, was considered as not sufficiently economical. In his room, they sent out a board of directors, in whom they conceived full reliance could be placed. A merchant of Amsterdam, a jeweller of Haarlem, and a carpenter of Middleburg, were the persons nominated to succeed prince Maurice. On inquiring into the state of affairs, it soon appeared to these careful men, that it was needless to keep up fortifications which, according to all appearance, would not be needed; that arms and ammunition might be advantageously disposed of to the Portuguese, who were willing to purchase them at a high price; and that, by giving permission to a large proportion of the troops to return to Europe, the expence of their pay and maintenance might be saved. The Portuguese governor soon perceived and reported to his court the defenceless state to which the kingdom was reduced by this prudent system. The

king was dissatisfied with the manner in which the Dutch had executed many articles of the treaty; and as his war with Spain had been distinguished by brilliant success, he no longer felt the same entire dependence on the Dutch as before. He cautioned his officers, however, to avoid any open rupture with that nation, but at the same time to be on the watch for favourable opportunities of wresting from them the provinces which they occupied in Brasil.

This object was on the point of being very suddenly accomplished. Encouraged by the state of torpor in which the Dutch government was sunk, an individual conceived the idea of overturning it. In Maurice-town, which had become the capital of Pernambuco, there still resided a number of Portuguese, who were treated with great lenity. One of these, named Cavalcante, who exercised even the office of judge among his countrymen, formed a daring conspiracy for the massacre of all the Dutch who were at the head of the government. The occasion fixed for the perpetration of this enormity, was a festival, by which he was to celebrate the marriage of his daughter. The plot was discovered; but Cavalcante, and the principal conspirators, found means to escape, and having collected a number of their countrymen, began to lay waste the Dutch territories. A *petite guerre* was then begun, and carried on with great animosity on both sides; and though publicly disavowed, was secretly supported and encouraged by the Portuguese governor. This was pretty evident, when the insurgents were so well provided with artillery and ammunition, as to be able to lay siege to the strong places in Dutch Brasil. Yet so much was the government of Holland lulled by the assurances of the Portuguese governor, that they allowed a fleet from Portugal to touch and water at the port of Olinda. The same fleet then proceeded to the Rio Formoso, and there disembarked 1500 men, who immediately joined the army of the insurgents, and enabled them to gain considerable advantages. The Dutch, now roused, began to make warm and serious remonstrances to the court of Portugal. The king omitted nothing by which, without sacrificing his object, he could pacify them, and lull their vigilance. After representing the difficulties which they would experience in reducing the insurgents, he offered to take that task upon himself; he granted them advantageous treaties of commerce, and lavished upon them promises of every kind. The Dutch had then engaged with England in a most sanguinary and desperate contest, which was to determine which of the two powers should henceforth have the dominion of the sea. They were therefore easily deceived, and induced to shut their eyes to remoter interests. In consequence of this neglect, the Portuguese interest silently strengthened itself in Brasil; their force was augmented, and new places of strength were added to those which they had already taken from the enemy. In 1654, therefore, when the republic had concluded peace with England, and when it was evident that the professions of the court of Lisbon were wholly insincere, they determined to apply themselves vigorously to the preservation of this important possession. Preparations were accordingly made to equip a fleet of thirty sail, with a corresponding number of land troops on board. But while they were still involved in the bustle of preparation for this armament, news arrived, that its object was no more; that the Portuguese were now entire masters of Brasil.

In consequence of the neglect of the government at home, affairs at Olinda had been becoming continually worse. The troops were not only diminished in number; but those who remained not being regularly paid or supplied with provisions, and not being allowed to return home at the expiration of their period of service, began to shew strong symptoms of discontent and irritation. The warlike stores, disposed of by the economy of the board which succeeded Prince Maurice, had never been replaced; and the naval force of the colony had been reduced to a single vessel. The Portuguese, judging this a favourable moment, drew out their whole force, both naval and military, and having formed a large army, with a fleet of sixty sail, which accompanied its progress, and supplied it with provisions, they proceeded directly against the city of Olinda. They were expected there, not as enemies, but as deliverers. Schoupe, the governor, surrendered without striking a blow, on receiving permission for his garrison to return to Europe. The capitulation was signed on the 20th January, 1654.

The Dutch were struck with equal concern and indignation at seeing themselves deprived of so valuable a possession, by an ally who had lavished on them so many professions of amity. Hostilities were immediately commenced against Portugal, both in Europe and in the East and West Indies; but no attempt was made for the recovery of Brasil. The war was prosecuted for six years with great animosity, but without any success that could compensate for the burdens which it imposed. At length, on the 1st March, 1661, the province of Holland addressed a memorial to the others, representing the absolute necessity of thinking on peace. The rest, however, though they agreed to open a negotiation, expressed their determination to remain satisfied with nothing less than the entire restoration of their former possessions in Brasil. They allowed, however, the ambassadors to meet, on its being conceded by the Portuguese, that this should take place at the Hague. The Dutch plenipotentiaries immediately opened their demand of Brasil, declaring, that unless they were satisfied, no treaty could be brought to a conclusion. The Portuguese, however, justly represented, that, in the present state of affairs, such restitution was entirely out of the question; but that they were willing to give a liberal pecuniary compensation. All the states acknowledged the necessity of contenting themselves with this offer, excepting the maritime province of Zealand, which, being deeply embarked in the West India Company, protested against a treaty founded on any other basis, than the entire restoration of the provinces which they had lost. Its remonstrances, however, were overruled, and on the tenth of August, a treaty was signed, by which the whole of Brasil was finally ceded to Portugal. That power agreed to pay in return eight millions of florins, by sixteen instalments, in salt and West India commodities. Dutch vessels were likewise allowed to sail from Portugal to Brasil, and from Brasil to Portugal, importing and exporting all commodities whatever, with the single exception of Brasil wood. Large privileges were likewise granted to the Dutch trade with other parts of the Portuguese dominions. But the concession, with regard to Brasil, was found, in practice, to be of very small value. The ports of that country are little open to those who profess any other religion than the Catholic. The arbitrary conduct, besides, of the governors, and other officers, exposed them to con-

tinual outrages, for which redress was not easily obtained. The Dutch, therefore, have long ceased to avail themselves of this permission.

Not to interrupt the thread of this narrative, we have omitted to notice some transactions which had meantime occurred in the interior of Brasil. The race of malefactors with which its coast was at first peopled, could ill brook the restraints of law and government. A number found means to emancipate themselves by flight; and the district of St Paul, in the interior and southern part of Brasil, presented them with an inviting retreat. Here they formed intermarriages with Brazilian females, and the mixed class thus produced, received the name of Mameluss, in allusion to the servile race which has held the dominion of Egypt. The country in which they settled was of the most luxuriant fertility, and being surrounded by forests and vast mountains, presented a secure asylum. Instead, however, of applying to cultivation and peaceful pursuits, they abandoned themselves entirely to rapine and disorder. They plundered alike all their neighbours, Portuguese, Spaniards, and natives; the latter they carried off as slaves. In order to accomplish this more effectually, they practised a most atrocious stratagem. The Jesuits, by their benevolent exertions, had gained the full confidence of the Indians bordering on the La Plata, and had converted many of them to the Christian faith. The Paulists assumed the dress and character of Jesuits, and having after their example, persuaded the natives to embrace Christianity, they then, on plausible pretences, seduced them into their own settlements, where the unhappy victims were immediately converted into slaves. By these criminal methods, they were enabled to cultivate their fertile lands, and to acquire some wealth. Hence they were gradually softened into a degree of civilization, and were induced, by the combined influence of fear and persuasion, to acknowledge the supremacy of the Portuguese government, and to pay a certain annual tribute.

About the conclusion of the Dutch war, Brasil was afflicted by another insurrection, arising from a different source. About the year 1570, negroes had begun to be imported into Brasil; and as they were found much better fitted than the natives for the labours of cultivation, the nefarious trade was soon carried to a great extent. In the course of the wars which the two nations waged against each other, it had frequently been found necessary to put arms into the hands of the negroes, and they had become in some degree warlike and inured to discipline. In the confusion occasioned by the capture of Olinda, about forty made their escape, and established themselves in a favourable situation on the frontier, near Porto do Calvo. This became a rendezvous for all of their nation who could emancipate themselves from bondage; and their numbers soon became considerable. They supplied the want of wives, like the first founders of Rome, by violence; they entirely swept the neighbouring plantations, carrying off every female of colour. Equal laws, joined to the possession of a fertile territory, and copious opportunities of plunder, caused their population to multiply with extraordinary rapidity; they soon erected themselves into a nation, assuming the name of the Palmares; they elected a king, whose dignity, however, was to last only for life. They procured supplies of arms and ammunition from the planters; and, continually apprehensive of attack, they formed stockades of large trees round

the capital and others of their towns. They remained unmolested, however, for forty years; and had grown in that time to such a height of power, as to threaten the very existence of the colony. The population of their principal town amounted to not less than 20,000. At length, in 1606, the Portuguese governor, seriously alarmed, collected, at Olinda, a force of 6000 men, which he placed under the command of Don John de Lancastro, with orders to proceed against the Palmares. That people, unable to meet such a formidable force in the field, shut themselves up, with all their effects, in the capital, to which the Portuguese immediately advanced and laid siege. They were struck with dismay, however, at the formidable aspect of the works, and the resolute countenance of their defenders; and this terror was increased by repeated and destructive sallies made by the besieged. Unprepared for such a resistance, they had made no adequate provision of artillery and supplies; the spirit of the troops sunk; and the Palmares entertained sanguine hopes of a speedy deliverance from this formidable invasion. The governor, however, was not so to be deterred; he prepared a detachment with every thing of which the besiegers stood in need. The Palmares, meanwhile, had exhausted their ammunition, and they began to feel all the horrors of famine; yet they were still supported by the hope that the enemy, equally destitute, would soon be compelled to desist. But when the reinforcement appeared, their courage entirely sunk; they saw the inevitable fate which impended; and their arms dropt from their hands. A general storm soon took place, and the resistance of the dispirited defenders being feeble, the place was soon carried. The prince, preferring death to captivity, threw himself down the rocky side of the fort, and was killed on the spot. Almost all the rest were taken prisoners, and sold as slaves.

This event was immediately followed by a brilliant æra in the history of Brasil. Her wealth had hitherto been derived exclusively from the productions of the soil, which, however valuable, could not vie in the estimation of Europeans, with the more splendid objects which the Spanish part of the new world presented. Yet, even in the sixteenth century, the Paulists had discovered gold in the heart of their mountains; and a report on this subject was made to Philip II.; but that monarch, governed by the base policy of depressing, as much as possible, his new subjects, either evaded the applications, or seconded them so coldly, that no result followed. After the separation of the kingdoms, the long struggle which Portugal had to maintain, for her own independence and the recovery of Brasil, engrossed almost entirely her attention; and she had little leisure to prosecute discoveries and improvements. In 1699, however, the neglect of government was compensated by the activity of some enterprising individuals, who discovered and began to work several gold mines in the back settlements. The metal was found abundant, and of easy extraction; and it soon appeared, that a vast source of treasure had been opened to the nation. The governments of Europe were not accustomed to look with indifference upon such operations; and the court of Lisbon took immediate cognizance of those which were going on in its colony. It ordained, that, on the discovery of a mine, immediate notice should be given to government; and that a fifth part of the produce should always be paid into the treasury. Other mines were soon discovered; and the produce was so copious,

that the king's fifth amounted to 480,000*l.* and consequently the whole produce to more than two millions. At this rate, it continued from 1728 to 1734. It then began gradually to diminish, till the whole produce sunk to 1,030,000*l.* and, consequently, the royal fifth to 257,500*l.* Besides this original tax, however, the government imposed a duty of 2 per cent. on its conveyance to Europe, which yielded nearly 16,000*l.* to which might be added the seignorage on the coinage of gold, amounting to nearly 80,000*l.* which raised the whole revenue derived from this source to 353,500*l.*

This discovery was, thirty years after, followed by another, still more unexpected. The workmen employed in the mines met often with little shining stones, which they threw away, as useless, with the sand and gravel. One of the overseers began to suspect that these might be of some value, and transmitted a specimen to the governor. They were immediately sent to Lisbon; and that court directed d'Acunha, its ambassador in Holland, to make them be examined by the jewellers of that country, who were reputed the most skilful of any. After repeated examinations, they were pronounced to be genuine and valuable *diamonds*. As soon as this important intelligence reached Brasil, the stones were immediately collected and sent over to Europe in such quantities, as greatly to lower their value. The court of Lisbon, which was exceedingly dissatisfied with this effect, adopted, in order to prevent it, a system of the most rigorous monopoly. They vested the trade in an exclusive company, and even this body they restricted from employing more than six hundred slaves in the employment. This restriction was afterwards taken off, and its place supplied by a moderate tax on every slave so employed. At length the government, envying the profits of the company, took the trade into its own hand. All restrictions upon the collection of the diamonds were then removed; but it was enacted, that every person who found one should deliver it to one of the crown agents at a fixed price; out of which, too, was deducted, as in the case of gold, the tax of a fifth. A series of the most rigorous precautions were employed, to prevent unlawful trade and embezzlement, both in the colonists employed in collecting the diamonds, and in the officers of the crown.

The whole sum produced to government by the mines of Brasil is, on an average, estimated at 148,500*l.* The diamonds are purchased by British and Dutch lapidaries, who cut and bring them into a state proper for sale.

After having acquired the entire possession of Brasil, the Portuguese began to form schemes for extending its boundaries. Their settlements bordering on those of the Spaniards, and both these nations being ambitious and enterprising, it was to be expected that liminary disputes should arise between them. The Rio de la Plata early appeared to the Portuguese to form a natural and convenient boundary to their territory. Soon after the era of the first discovery of these countries, they had sailed up that river, and occupied its northern bank. They did not, however, form any permanent settlement there; and as their attention was withdrawn by subsequent events, the Spaniards considered that side of the river as annexed to their territory of Buenos Ayres. In 1680, however, the court of Lisbon, reviving their ancient claim, caused an establishment to be formed at Santo Sacramento, near the mouth of the La Plata. The Spaniards appealed to the authority of the pope, who, happening to be in the interest of the Portuguese, admitted, indeed,

that the original line of demarcation had assigned that district to Spain; but insisted, that subsequent proceedings had transferred the right to Portugal. Meantime the Spanish governor of Buenos Ayres adopted a more vigorous method of determining the controversy. He equipped a formidable armament, and, finding no force sufficient to resist him, soon levelled with the ground the walls of the rising colony. The Portuguese court remonstrated loudly against this proceeding; and being supported by the authority of the pope, obtained an agreement, by which Santo Sacramento was restored to them, and the two nations were to enjoy in common the contested territory. This joint occupation was not likely to assuage the animosities of two hostile nations; and the war of the succession soon ensuing, allowed their hostile disposition to operate. The Spaniards again prevailed; and, in 1705, the Portuguese were expelled anew from Santo Sacramento. By the treaty of Utrecht, however, the English procured for them, not only its restoration, but also the exclusive possession of the territory on which it stood. Santo Sacramento then rose into a place of considerable importance. Its situation was favourable for a contraband trade with Buenos Ayres; and this trade was soon carried to an extent which gave equal prosperity to the colony and umbrage to the Spanish government. The latter could find no better method of guarding against the injurious effects of an establishment so reluctantly sanctioned, than by themselves forming settlements on the opposite side of the river, and carrying these as close as possible to the Portuguese territory. This proximity soon gave rise to quarrels; and perpetual hostilities unauthorised by the mother country, were carried on by the colonists of the respective nations. In order to put a stop to these, a convention was at length concluded between the two nations, by which Portugal resigned the colony of Santo Sacramento, on receiving in return seven of the missionary settlements formed by the Jesuits on the eastern bank of the Uruguay. Spain, however, had no right to make this concession; because the nations who composed these missions had submitted voluntarily to the direction of the Jesuits, but had not rendered themselves subjects of the king of Spain. They refused, therefore, to concur in the deed which transferred them to Portugal, and took up arms in their own defence. But they were unable to contend with the regular troops sent from Brasil, and were compelled either to submit or emigrate. The Portuguese court then insisted, that, as they had obtained possession of these settlements, not in consequence of the treaty, but by force of arms, they were absolved from the conditions on which they had been ceded. Thus all things reverted to their former confusion; and the same perpetual and harassing warfare was again recommenced. It continued to rage till the year 1777, when the Portuguese court found itself under the necessity of ceding the disputed territory, receiving, however, at the same time, that of St Pedro, which had been wrested from them.

These contests were carried on chiefly between the inhabitants of the American provinces themselves. Brazil, from its distance, and a received opinion of its strength, was not generally the object of those naval wars which, during the eighteenth century, were waged with such activity between the European nations. In 1711, however, the war of the succession, which had produced such formidable convulsions throughout all Europe, was felt in this remote region. Portugal hav-

ing espoused the cause of England and Austria, became thus the enemy of France; and the celebrated Admiral Duguay Trouin formed the design of obtaining possession of Rio Janeiro. With the most daring valour, he led his fleet through all the range of batteries which defended it, and carried the place by storm. In the peace, however, which was soon after concluded, Rio Janeiro was restored to Portugal.

All these wars, however, were of petty importance, and did not materially affect the interest and prosperity of Brasil. She was much more deeply affected by the commercial arrangements adopted by the mother country, for the regulation of her colonial intercourse. At the time of the first discovery of the new world, and for the greater part of the period which has since elapsed, the European nations were attached to a system of the most rigid commercial restriction. An ignorance of the true principles on which the prosperity of trade depends, made it be imagined, that the more minutely and carefully all its movements were regulated by government, the more beneficial was it likely to prove. The suspicious character, besides, of the states of the peninsula, and the concealment and mystery in which they delighted to wrap themselves, made them solicitous that colonial intercourse should be confined within as narrow limits as possible. These motives led to the introduction of the *flota* system, by which the intercourse between the mother country and the colonies was permitted to be kept up only from certain ports, and at certain seasons of the year. This system was adopted by Portugal as well as Spain, but on a considerably more liberal footing. Annual fleets were allowed to sail, both from Lisbon and Oporto; and as these cities, from their advantageous situation, engrossed almost all the commerce of Portugal, and were almost exclusively qualified for carrying on distant commercial enterprises, the restriction probably was not so severely felt. The ports in the colony which were allowed to hold intercourse with the mother country, were, in like manner, limited to four, Olinda, St Salvador, Paraiba, and Rio Janeiro. To these the same remark may be applied, though not, perhaps, to the same extent. The regulation which prevented the fleets from sailing oftener than once in the year, was probably much more injurious. However, in consequence of the inferior regard which was paid to Brasil, she was happily exempted from that complicated system of restraint and monopoly, under which the Spanish settlements groaned. To this circumstance, perhaps, she was mainly indebted for that measure of prosperity to which she silently attained. As soon, however, as, by the discovery of gold and diamonds, Brasil began to be regarded as an immense source of wealth to the crown, the fortunate indifference with which it had before been regarded, entirely ceased. Rigid regulations, as we have seen, were enacted, in order to secure to the crown the ample revenues arising from these valuable productions; and in order to render these regulations effectual, it became necessary to establish a general system of restraint, which cramped the growing prosperity of the colony. About the middle of the last century, under the administration of the Marquis of Pombal, Portugal exhibited the singular and melancholy spectacle, of a nation beginning to adopt an exploded system, at the very moment when every other people was abandoning it, and studying to remedy the evils which it had occasioned. This system was that of exclusive companies, which

VOL. IV. PART II.

Pombal carried to such an extent, as to subject to them even port wine, the staple commodity of the kingdom. Extending it to Brasil, he subjected to an exclusive company the trade of the northern provinces of Maragá, Para, and Fernambuco. The regulations of this company were, in some respects, of a nature peculiarly preposterous. Ignorant of the limits which bound the authority of sovereigns in commercial affairs, the court of Lisbon ordained, that the shares in this company's stock should bear a certain price; and, in order to enforce this regulation it was decreed, that they should be a legal tender of payment. To such of our readers as are at all conversant with political economy, it is needless to point out the impossibility, that such an ordinance should ever be executed. The preposterous attempt, however, must no doubt have lowered the credit of the company, and embarrassed its transactions. This cause, and the radical defects of such an establishment, soon induced a material diminution in the commerce of these provinces. The number of vessels employed, sunk from thirteen or fourteen, to four or five. The ministry, therefore, who succeeded Pombal, being of themselves unfavourably disposed to measures pursued by their predecessor, hesitated not to reject one so unpopular and injurious. The old arrangement was then restored, though, there is reason to believe, with some abatement of the rigour of the *flota* system. Upon the whole, the system of commerce between Portugal and Brasil has been on a much more liberal footing than that between Spain and her colonies, and the productions of other European countries more easily admitted. This was owing, in a good measure, to the intimate connection of the mother country with England. Portugal, from its position with regard to Spain, and its inferior magnitude, was in constant danger of being swallowed up by a more powerful neighbour; and from the establishment of the Bourbon dynasty on the Spanish throne, no aid was to be hoped from France in maintaining her independence. She looked, therefore, to England as her natural protector; and, in order to cement the alliance with that power, was willing to grant some commercial privileges which her colonial possessions rendered peculiarly valuable. On the 20th December 1703, a treaty was concluded between the two powers, by which the manufactures of England were allowed to be imported into Portugal on terms more advantageous than those of any other European country. England made a similar stipulation in favour of the wines of Portugal; so that it seemed to remain doubtful, even according to the ideas then prevalent, on which side the balance of advantage lay. The article in the treaty, however, which excited the exultation of England, and the envy of Europe, was rather understood than expressed. It was fixed, that an English packet boat should sail weekly from Lisbon to London. As this vessel belonged to government, it was exempted from search; and an opportunity was thereby afforded, of eluding those strict penalties, which were imposed on the exportation of gold. It was soon complained, that all the gold of Brasil took the road of the Thames. Sounder views, which have since opened, have shewn, that this envied advantage was wholly chimerical; that all the gold necessary for our circulation, would, of itself, have found its way into this country; and that, even if Portugal could have rendered her prohibition effective, the injury would have been on her side, not on ours. The free introduction of British manufactures, however.

S G

was a mutual advantage to both nations; and it rendered the supply of many of the comforts and conveniences of life more copious in Brazil, than in most of the Spanish colonies. They were often supplied, on still easier terms, by means of contraband trade. British vessels, on their way to the East Indies or to the South Sea, have been accustomed to touch at the friendly ports of Brasil; and there they often found means to introduce European commodities at a cheaper rate than they could be sent from Portugal. Previous to the late emigration, however, the court had adopted very strict measures for preventing this irregularity. No trade of any kind was allowed between the natives and British; though, as the persons who were employed to enforce this regulation, found often their interest in violating it, the intercourse could not be entirely stopt.

Such was the course of events in Brasil, while it continued a subordinate part of the Portuguese empire. Recent events, by transferring to it the residence of the court, have raised it to a higher importance. The connection of Portugal with England, which had long been a source of security, ceased to afford her protection, when the power of France became predominant over the continent. On this very account, the present ruler of France, as soon as he had obtained a respite from warfare in the east of Europe, selected Portugal as his first victim. Measures had been repeatedly taken to expel the Prince Regent from his European territories, though they were suspended, first by the peace of 1801, and afterwards by the war with the northern powers. But when Prussia and Russia had successively sunk under the French arms, Buonaparte no longer hesitated to put his long-meditated design into immediate execution. In the autumn of 1807, he began his operations, by issuing to the Prince Regent a mandate, that the English and their commerce should be entirely excluded. The prince, though extremely unwilling to renounce so long and faithful an alliance, yet, overawed by the French power, determined to yield. The British merchants were accordingly warned to leave the kingdom, with all their effects; with which they lost no time in complying. The prince, however, was soon given to understand, that he must not only exclude the English from the kingdom, but must seize the persons and property of all of that nation who could be found within it. Sir Sidney Smith, on the contrary, who commanded an English squadron at the mouth of the Tagus, declared that his government would not found any hostile measures upon the exclusion of British commerce, but that, if the regent proceeded a step farther, he would immediately declare Lisbon under a state of blockade. The prince, however, under the alarm of impending danger, had the weakness to consent to the conditions required by Buonaparte, and to issue orders for confiscating all that remained of British merchandize. He soon found, however, that this humiliation would avail him nothing. Junot, with 40,000 men, was marching with incredible rapidity upon Lisbon, and had arrived at Abrantes before the Portuguese government were aware of his having entered the country. Three days after, on the 29th November, the vanguard of the French army appeared on the heights above Lisbon. By this time, however, the determination of the prince had been formed. Seeing fully that no concession could save him, he determined upon emigration to Brasil. Every thing of value, which could be transported, was hastily

put on board the fleet, which set sail on the 29th; so that the French troops arrived just in time to witness its departure. They entered Lisbon on the following day.

The prince, after a prosperous voyage, arrived, on the 25th January 1808, at Bahia in Brasil. He spent a month there, visited the most remarkable places in its neighbourhood, and was received with enthusiastic expressions of joy. He then sailed to Rio Janeiro, where he established his residence.

Since that time, no political events of importance have occurred, unless in the European dominions of this prince, which, of course, fall to be related under another head. Soon after his arrival, however, at Rio Janeiro, a treaty of commerce was concluded, which contains many important provisions. The ports of Brasil, formerly shut against British commodities, were now laid open, upon the payment of a duty of 15 per cent. Gold and silver, however, according to the old commercial prejudices, were excepted, and continued still to be prohibited. The island of St Catherine's was declared a free port. At the same time, unlimited permission was granted to build ships for the use of the British navy, and to employ the noble forests of Brasil in their construction.

In consequence of these arrangements, Brasil has become extremely interesting to this country, in a naval and commercial point of view. It may be proper, therefore, to give, at some length, a view of its extent, productions, and of the different provinces which stretch along its coast.

The most northern government is that of Para, situated immediately upon the river of the Amazons. It comprehends even that part of Guiana which belongs to Portugal; and the part of this government which lies south of the great river, and which properly belongs to Brasil, extends to the frontiers of the province of Maragnan. It is of considerable fertility, though little cultivated. The foundation of the town of Para, or Belem, was laid in 1615. The trade was for some time confined to vanilla, sarsaparilla, and cotton, the spontaneous produce of the ground, which were collected by the Indians, and brought to the capital. But when the labour of negroes was introduced, some cultivation took place, and the different West India products were raised, though not in very great abundance. The progress of this settlement was, in the middle of the last century, severely checked by the exclusive company, established by the Marquis of Pombal; though it may probably have availed itself of the removal of this restraint, which took place about twenty years after. The approach to the harbour is difficult, on account of the currents; but, within, the anchorage is good. The population of this province is stated at 4128 whites, 9910 negroes or mulattoes, and 34,800 Indians.

The next province is that of Maragnan, which extends along the coast, from the frontiers of Para, to a range of mountains, which separate it from Fernambuco. The Portuguese first established themselves in it about the year 1600. In the year 1611, some French gentlemen, Devaux and La Ravardiere, established themselves in the isle of Maragnan, and built on it a fort, which they called St Louis. They were driven from it, however, a few years after by the Portuguese, under the command of Albuquerque. About the year 1640, the Dutch extended their conquests to this province, but lost it again,

along with the rest of Brasil. The first production drawn from this country was ambergris, which was afforded in considerable quantities; but this article being exhausted, the inhabitants betook themselves to the cultivation of the common tropical productions. It was soon found that the cotton of Maragnan surpassed in value every other species produced in the new world; and a copious source of wealth was thus opened. Different species of dyes, particularly that called *Rocou*, are copiously produced; and the plains behind are filled with horned cattle, which obtain a ready sale in the more populous provinces adjoining. The first and still the best inhabited part is the isle of Maragnan, or St Louis, which is separated from the continent only by a river. It is seven leagues in length, four in breadth, and of exuberant fertility. All the commerce of the province is carried on by the port of St Louis, no other part of the coast being accessible, on account of the shallows and hills of sand, with which it is bordered. This harbour, too, possesses merit only by comparison; for it is beset with rocks and islets, which render the passage extremely dangerous. Only two entrances have been discovered, one on each side of the island of St Anne. The population of this province is calculated at 9000 whites, 18,000 negroes and mulattoes, and 39,000 Indians.

South-east of Maragnan is a district called Ciara, or Scara, where the Portuguese have formed so few settlements, that some doubt is entertained whether it ought to be reckoned among the number of their provinces. They have constructed a fort, however, in a situation where there is a harbour, though capable of receiving only small vessels. Two or three ships touch here annually, to take in the few productions of this district.

We come now to the extensive government of Pernambuco, which extends along the coast, till it is bounded by the great river of San Francisco. It is formed by the union of four provinces, those of Pernambuco Proper, of Paraiba, of Rio Grande, and Tamaraca. These were the districts held by the Dutch, so long as that nation kept its ground in Brasil; and they are accordingly the most carefully cultivated. Sugar, the most valuable production of these climates, is raised here in greater perfection, than in any other part of South America. Brazil wood, besides, which this country exclusively produces, is found in the province of Pernambuco alone. The government, however, has been careful to circumscribe the benefit derived from it, by making it the object of a monopoly. The value of this wood imported into Europe amounts, however, to between 30,000*l.* and 40,000*l.*

Olinda, the capital of the province, and formerly of all the Dutch dominions in Brasil, is situated on a hill, at about a mile's distance from the sea. It contains only two thousand Portuguese inhabitants, but a much greater number of Indians and people of colour. Its trade is carried by the Recife, or port, situated at the mouth of the river on which the city lies. The harbour is far from good, the entrance for large vessels being extremely narrow. Along the whole of this coast extends an almost continued wall of rocks, about sixty feet high, allowing vessels to approach only by a few narrow openings at different places.

Tamaraca is situated only five miles north of Olinda, upon an island, which is separated from the continent by a narrow channel. It contains a pretty good harbour. The district attached to it is the property of the Marquis of Monsanto. Paraiba, which, under the Dutch

government, became a place of considerable importance, has also a tolerable harbour, at the mouth of a river of the same name. Rio Grande is situated on a rock in the river of that name, and is, by its situation, nearly impregnable. The district of Rio Grande produces wheat, hemp, cows, and horses, in such abundance, that it is reckoned the richest part of Brasil; but, owing to the numerous flats in the river, it is not able to carry on an extensive navigation. The isle of Fernando di Noronha, though at the distance of sixty leagues from the coast, is also attached to the government of Pernambuco. The Portuguese merely keep a garrison there. The whole of Pernambuco is supposed to contain a population of 19,600 whites, 39,000 negroes and mulattoes, and 33,700 Indians.

On passing the great river San Francisco, we find ourselves in the government of Bahia, long the centre of Portuguese dominion in this part of the world. Like that of Pernambuco, it is composed of four provinces, Sergippé, Bahia Proper, Dos Ilheos, and Porto Seguro. Bahia Proper is the most fertile and populous of all the provinces. The plantations are extended to a considerable distance inland, and are of great extent, employing often two or three hundred slaves. Sugar, cotton, and tobacco, are the staple productions. The capital, Bahia, or St Salvador, carries on a very extensive trade, both with the mother country, and with the other provinces. The bay on which it lies forms one of the noblest harbours in the world. It is twelve leagues in length and three in breadth, is entered from the south, and affords anchorage, where the united shipping of the globe might be fully accommodated. The city is situated on the right side of the bay, on a steep hill, with a single street, parallel to the beach. The most magnificent edifice is the grand church of the Ex Jesuits, which is built entirely of European marble, while every species of ornament is lavished on its interior. The college and monastery attached to it, being no longer occupied, have been converted into an hospital. The remaining churches are loaded, though in a less degree, with the same gaudy and superstitious ornaments; but the general appearance of the town is far from corresponding to these structures. The streets are narrow, ill paved, and excessively dirty. The houses, even of the opulent inhabitants, have a dull and dirty appearance from the street; while those of the lowest rank are composed of tiles, open to the roof, and instead of windows they have wooden lattices, which are not even painted. The city is populous, containing upwards of an hundred thousand inhabitants, of whom thirty thousand are whites, thirty thousand mulattoes, and the rest negroes.

The only present defence of St Salvador consists in a fort called Do Mar, situated on a small rocky bank, about three quarters of a mile from the shore. It is chiefly indebted for its strength to the Dutch, who fortified it during their attempt to obtain possession of the place, in 1624. It consists of a circular tower, with a lower battery: the diameter of the whole is about 270 feet. The shipping, by lying between this fort and the city, are placed under its protection. Five hundred men compose its garrison; but through the negligence of the government, this number is never complete. The passes leading inland, to the north and south, are also defended by two forts, Barbalho and St Pedro, neither of which, however, possess any considerable strength. The troops of the city, including militia, amount to about 5000; one regiment of which is composed of mulattoes

and free negroes. Ships of war are constantly building; but as the dockyard admits only one at a time, the augmentation of their navy cannot be very rapid.

Bahia carries on a very extensive commerce, both with the mother country, with the other provinces on the coast, and with the interior. From the different parts of its own government alone, eight hundred launches and sumacks daily enter the harbour, bringing the various productions of the neighbouring territories. It is the centre of the trade of all these districts, and the medium through which they transmit and receive commodities to and from the mother country. About fifty vessels are employed in the trade between Lisbon and Oporto, bringing from thence provisions, and every kind of European commodity, and carrying in return cotton, sugars, coffee, tobacco, dying woods, and medicinal roots. The trade to the more distant provinces of the colony is also considerable, particularly that to the southern province of Rio Grande. The European commodities carried thither, are disposed of, not only to the Portuguese inhabitants, but also to the Spaniards of Maldonado and Monte Video; and the vessels in return bring dried beef and hides, the produce of the vast meadows which extend in the neighbourhood of those settlements.

Besides the capital, this province contains Cochoria, finely situated on the banks of a river, fifteen leagues in the interior, and the mart for the northern gold mines of Brasil. It contains also Tagoaripe, Amoro Jacobina, Do Sitis, and San Francisco, at each of which a considerable trade is carried on.

Between Fernambuco and Bahia Proper is a small province, called Sergippé. It is thinly inhabited, and little known to Europeans. The capital of the same name, is situated on the Rio Real, and sends maize and cotton to Bahia.

On the south of Bahia, is another small province called Dos Ilheos, from a number of islands which cover the entrance of the bay on which it is situated. It is much less cultivated than Bahia, and supplies the capital with little except timber. The banks of the Rio Grande, which separates it from Porto Seguro, are bordered with immense forests, producing the best timber of Brasil, whence the royal navy derives its chief supplies. An expedition sent up this river pursued its course for fifteen days, without meeting with bar or obstruction of any kind.

To the south of Dos Ilheos lies the province of Porto Seguro. This province is equal in fertility and beauty to Bahia, but the cultivation is much inferior, being chiefly confined to the banks of the river on which the capital is situated. The harbour of Porto Seguro is formed by an opening in that ledge of rocks which runs along all this part of the Brazilian coast. The depth of water at the entrance is twenty feet, but in the interior twelve forms the average. The inhabitants here give themselves up to more than the usual share of Portuguese indolence and languor. Fish, though abundant on the coast, is scarcely to be had fresh, and the inhabitants depend chiefly upon the importation of that article salted. Although the savannahs in the country behind are overrun with cattle, beef is excessively scarce. Near the *abrolhos*, or rocks, indeed, islands, which lie off the coast, a fish resembling salmon is caught for the Bahia market: and this furnishes employment to about 3000 people. Southward from Porto Seguro, the coast is extremely neglected, till we arrive at the river Care-

vellos, where there is a good harbour, though the entrance is rather dangerous. The banks of this river form the store, whence manioc, an essential article in the subsistence of Brasil, is chiefly supplied.

With Porto Seguro terminates the government of Bahia; and we come then to that, which has now taken the lead among all the rest,—the government of Rio Janeiro. It is not less favoured by nature than the other districts; but so long as St Salvador continued to be the capital, it experienced a comparative neglect. The views of the government, however, were greatly changed, when, about the beginning of last century, the gold and diamond mines were discovered in the districts immediately behind it. Rio Janeiro then rose at once to the first importance; and on the discovery of its admirable harbour, the seat of government was transferred thither. This harbour is perhaps the finest in the whole world. Like that of Porto Seguro, it is formed by a narrow opening in the ledge of rocks which walls all this part of the coast. When the mariner has entered, however, he is struck with one of the most magnificent spectacles in the whole compass of nature; a bay an hundred miles in circumference, surrounded with a vast amphitheatre of mountains, which rise in every varied form, and are covered with eternal verdure. Vessels of all dimensions may enter and repose with perfect security in every part of this immense basin. The city, which is called St Sebastian, is situated upon a hill on the north eastern side of the bay. It is better built than St Salvador. The streets are straight; the houses generally of two stories, and many of them handsome. The town contains 60,000 inhabitants. The province is not yet so well cultivated as Bahia; but its capacities are equal, and it is rapidly improving.

The government of Rio Janeiro includes also the ancient captaincies of Spiritu Santo on the north, and St Vincent on the south. The former has been boasted of as the most fertile province of all Brasil. The water and the land are equally productive; and the woods are filled with innumerable wild animals for hunting. The Indians are very numerous in this district, great numbers having been converted by the Jesuits. The harbour of Spiritu Santo is composed of a bay, the entrance into which is attended with some risk, on account of dangerous rocks which run along the northern side, and of a bank of sand which obstructs the narrowest part. A rock, which rises in the form of a sugar-loaf, and afterwards a white tower within the bay, form the beacons by which mariners are to be guided. The harbour, when entered, is commodious and secure.

To the north of Rio Janeiro is the captaincy of St Vincent, the least fertile and cultivated of all the rest. It has derived some importance, however, from its vicinity to the mines on one side, and, on the other, to the Spanish settlement of Buenos Ayres. In the interior lies the territory of St Paul, the residence of the Paulists, of whom we have formerly given some account, and in which some gold mines have recently been discovered. The principal cities are Santos and St Vincent, situated within a few leagues of each other. The former has an excellent harbour, the latter an indifferent one. But the place in this district which it is most important for us to be acquainted with, is the island of St Catherine, which, by the late treaty, was declared a free port to our trade, and in which British merchants may settle and practise their religion without molestation. Less, however, is known of this island than its importance deserves.

It serves as a staple place to the products of the rich province of Rio Grande, not only on account of its vicinity, but from its excellent harbour, which is the best in Brasil, except that of Rio Janeiro. The person to whom it was granted, in 1554, by the Portuguese government, was dispossessed by English corsairs, and the island, then neglected by its original possessors, became a common resort of all nations. It remained thus in a state of independence till about the year 1738, when the Portuguese government, now at peace, recollected that this island formed part of its dominion, and sent an administration to take possession of it. They fortified the road, and established a garrison. In 1778, it was invaded by the Spaniards, but restored, at the peace, to its ancient masters. It is nine leagues in length, and two in breadth, enjoys the utmost felicity of soil and climate, and one of the best harbours in all America. From its situation near the mouth of the river La Plata on one side, and the opulent capital of Rio Janeiro on the other, it is admirably calculated for becoming the emporium of an extensive commerce.

The governments now described extend all along the coast, and the cultivated land, as is usual in newly settled colonies, does not reach to any considerable distance inland. There is, however, in the interior, a large mountain plain, enjoying a very fine climate, which, though long neglected in comparison of the rest, was raised, by an unexpected circumstance, into distinguished importance. This circumstance was the discovery, in the beginning of last century, of the gold and diamond mines, which were all in this central district. When found thus productive in the most coveted objects of American wealth, it soon attracted the attention of the Portuguese court. It was divided into three governments, called Minas Geraes, or the General Mines; Goyaz; and Matto Grosso. Minas Geraes is by far the most productive. Its annual produce in gold is estimated at nearly 800,000*l.* sterling; its inhabitants are reckoned at 35,000 whites, 26,000 Indians, 108,000 slaves. The capital is Villa Rica. The province of Goyaz produces annually in gold about 200,000*l.* Its population is 9000 whites; 30,000 Indians; and 34,000 negroes. The capital is Villa Boa. The only town in Matto Grosso is Villa Bella, and its population does not exceed 2000 whites, 4300 Indians, 7300 negroes. It produces gold to the value of about 62,500*l.*

Mr Lindley, the most recent traveller in Brasil, has given the following table of latitudes and longitudes, which he states himself to have obtained from Portuguese manuscript charts made after a new survey.

	Latitude. ° ' ''	Longitude. ° ' ''
City of Belem	1 30	48 30
Maranon	2 32	43 40

The port charges for every vessel not belonging to government, are at Fernambuco and Bahia, 4*l.* 18*s.* 4*d.*; and the daily expense of continuing in port 2*l.* 9*s.* 3½*d.* In Rio Janeiro the first expense is 7*l.* 4*s.* the daily expense 1*l.* 2*s.* ½*d.* The two former places afford the best materials for the repair of vessels; but it is more difficult to obtain permission to touch at them; and from being less accustomed to the visit of foreigners, they are more apt to treat them with rudeness. Masters of vessels ought as much as possible to transact business themselves, and trust little to the natives. Caulking is performed in Brasil in a manner not excelled by any place in the world.

The population of Brasil is composed of Portuguese, negroes, and Indians. The former do not differ materially in character from those in the mother country. They are still more superstitious. In the principal towns, never a day passes, that some saint is not carried in procession through the streets, the figure of which, though extremely rude and grotesque, is adorned with jewels and precious stones, which are cheerfully lent by the wealthier inhabitants. The ceremony is accompanied by the populace with rockets, squibs, and other demonstrations of extravagant joy. The manners, however, of the numerous monks and priests are generally described as no ornament to their profession. Yet Brasil possesses the advantage of the mother country in having been always free from the scourge of the inquisition. Those who are supposed liable to its sentence, may be sent to Lisbon and tried there; but still its yoke must be much less severe, than if it were established, and acting on the spot.

The Brasilians are generally branded by foreigners with the character of craft and perfidy; vices natural to the subjects of an absolute government, especially of one which imposes such a multitude of superfluous and ruinous restraints on commercial intercourse. Revenge and cruelty formed also prominent features, and assassinations were frequent; but in the southern provinces of Bahia and Rio Janeiro, the greater refinement of society has greatly alleviated the violence of these passions; though at Fernambuco and in the north, they still rage as much as ever. The manners of both sexes are generally described as extremely licentious; and those of the ladies of Rio Janeiro have been exposed to peculiar reproach, from the custom of throwing flowers from the windows on passing strangers. Mr Barrow, however, candidly supposes, that this is merely a national custom, which is not understood to imply any dereliction of virtue. There seems no doubt, however, that Brasil contains a full proportion of licentious characters of both sexes.

Except religious ceremonies, there are few public amusements in the cities of Brasil. Their attempts at theatrical entertainment are wretched, both in point of accommodation and performance. Music only, for which the people possess a natural talent, is performed with tolerable skill. But the most favourite of all recreations is the dance of the country, a compound of the

Spanish Fandango with the negro, and surpassing both in licentiousness. Growing refinement of manners, however, is gradually banishing this indecent exhibition, which is now indulged in with some degree of secrecy. In Bahia, by the latest accounts, card parties had begun to be established, which promise to bring the tone of society nearer to the European standard.

The gorgeous magnificence in which the wealthy Brasilians indulge, is accompanied with a total neglect of internal neatness and cleanliness. This appears in their clothes, in the furniture of their houses, and in the manner of preparing their food, which is in the highest degree disgusting. Their bodies are filled with vermin, which are searched for without disguise, and a certain cutaneous disorder, the consequence of filth, which is accounted so disgraceful in this country, is there so universal that no one thinks of concealing it. Notwithstanding the abundance of cattle, provisions are bad, as the inhabitants are incapable of those attentions, which, in a warm climate, where perspiration is so profuse, are necessary in order to fatten them. There are no inns for the accommodation of strangers: A person who takes up his residence, for however short a time, must hire and furnish a house for himself.

The most profound ignorance reigns throughout this country; and there seems as yet to be no impulse of curiosity which can afford the hope of its speedy dispersion. Some naturalists belonging to a British vessel, having engaged in an excursion into the country, and being seen wandering through its unfrequented tracts, the government took alarm at so unaccountable a conduct, which was removed by the assurance that they were catching butterflies. Thus the inexhaustible field which this country opens for the cultivation of botany and natural history is yet untrodden; and even the condition of the neighbouring Indian nations, though so interesting and accessible an object of enquiry, has not received any illustration from them.

There is one characteristic, very little to be expected under such a government, in which the Brazilian colonists do not seem to fall short of the freest people of the new world; this is, in the general sentiment of equality which pervades all ranks. The white servant converses with his master on the most equal footing, and instead of promptly obeying his commands, enters into a discussion on their propriety, and often advises a different course of proceeding; all which the master takes in good part, and often adopts his suggestions. The same manners prevail among the troops, and even on board ships of war. Never an order is issued, which does not become an immediate subject of debate and dispute; till the captain, who apparently is not so indulgent, terminates it by the vigorous application of a strong cane, which he carries constantly about with him. An Englishman, who ventured to remonstrate against the very liberal use of this instrument, was assured, that "no work could go on without it." The naval officers, indeed, seem to know very little how to keep up their dignity, since they are often seen engaged in the same card party with the private sailors.

This sentiment of equality, which, though attended with some inconveniences, cannot be considered as the worst feature in the character of the Brasilians, operates with peculiar advantage in mitigating the severity of negro slavery. This class assume in their manner the same equality which is practised by the other inhabi-

tants; they are well fed, and not hard worked; and they are allowed two days in the week to labour for themselves, by which means many are enabled to purchase their freedom, while others obtain it by favour. It was even enacted by the late King of Portugal, that, after remaining in bondage for ten years, they should be entitled to their liberty; but though this law has never been repealed, its execution has been evaded by the planters. The negroes whose condition is hardest, are those employed in the mines, particularly of diamonds; for when suspected of swallowing these, with a view to secrete them, violent emetics and cathartics are often administered, with the view of making them disgorge the hidden treasure; a treatment the more severe, as it is often founded on unjust suspicion.

The Indians form the third division in the population of Brasil. The conduct of the court of Lisbon with regard to this unfortunate class of men, has, from the first, been singularly liberal and humane. This has been principally owing to the solicitations of the Jesuit missionaries, who may justly be considered as the principal benefactors of the new world. The first settlers, in their predatory warfare with the natives, made slaves of all those who fell into their hands, and probably undertook expeditions for the express purpose of obtaining them. These practices were, in 1570, prohibited by King Sebastian; the prohibition was confirmed, in 1595, by Philip II.; and successive regulations to the same effect were issued at the beginning of the following century. The necessities of the colonists, however, who could cultivate their lands only by the labour of Indians, evaded the execution of all these laws, even though they were repeated in a still more formal manner, in 1647. The court, however, continued still indefatigable in issuing its mandates, and at length, in 1755, under the vigorous, and in some respects enlightened, administration of the Marquis of Pombal, the measure was finally carried into execution. The court of Lisbon certainly derive high honour from this unwearied perseverance. The benefits, however, which were expected to result from it by the friends of humanity have not yet been fully realised. The natural indolence of this people, their want of capital, and of opportunity, have prevented them from emerging from their original degradation. They are employed only in the most menial offices; they form the sole exception to the general system of equality, and enjoy a consideration decidedly inferior to that even of the negro slaves. Their intercourse is almost solely between themselves; and their quiet suspicious character indicates the state of humiliation in which they are held.

Having thus given a general sketch of the discovery and history of Brasil, and of the different provinces into which it is divided, we shall conclude this article with the information which we have been able to collect, respecting the statistics and commerce of this interesting portion of the new world.

When the Europeans first settled in Brasil, the country was extremely unhealthy, from the thick forests with which it was covered. But as the cultivation of sugar increased, and when the woods were cut down, the soil became fertile, and the climate mild and healthy. In consequence of the refreshing winds which constantly blow from the sea, the air is not only cool, but during the night it is so chill, that the natives are obliged to light fires in their huts. The northern provinces are

subject to severe storms and heavy rains, but those in the south are more fertile and temperate. The rainy season in Brasil begins in April and ends in August; and though the temperature is then greater than during the dry season, it is called winter by the inhabitants.

In the interior of Brasil there are great chains of mountains, mingled with superb vallies and large fertile plains. The principal chain passes westward from the government of St Paul; but this and the other mountainous ranges have never yet been described.

The principal rivers of Brasil are the Maragnan, the Paraiba, the Para, the Panacas, the Tocantin or Socantin, the San Francisco, the Rio dos Ilheos, the Rio Dolce, the Parana, and the Rio Grande. The merchandise of Europe is carried up the Rio Grande, partly by the force of oars, and partly by drawing the vessels with ropes. Sometimes more than two months are spent in this tedious navigation; but the gold and silver, and merchandise of America, which comes from the new kingdom of Granada, are brought down the river in the short space of three weeks. The Rio Dolce runs in a serpentine motion from west to east, and after receiving different rivers, it waters the province of Spiritu Santo, which it separates from that of Seguro, and then runs into the sea. The San Francisco, whose source is not well ascertained, runs to the north east, and after passing for a considerable way under ground, it takes an easterly course, and separating Fernambuco from Sergippe, it empties itself into the ocean. The Parana, after mixing its waters with the river Gaibuio, joins the San Francisco. The river Para, which is known only at its embouchure, runs from south to north, and falls into the gulf formed at the mouth of the river Amazons.

The principal productions of Brasil are tobacco, wood, sugar, salt, and hides. The culture of tobacco, which forms a considerable part of the revenue, occupies only a small part of the year; and the labour is so easy, that a single negro can manufacture annually about two thousand pounds weight. The tobacco is put up in rolls of from 200 to 300 pounds each, and is exported to Europe, and to Higher and Lower Guinea.

Timber forms the natural staple of a yet uncultivated country; and no region in the world produces finer forests than those of Brasil. The principal woods, as we have already observed, lie on the Rio Grande, in the captaincy of Porto Seguro. One species, called the *sipityira*, resembles the teak of India, which is well known to be superior to any European wood for firmness and durability. There are also the *peroba*, *oraubu*, and *louro*, which resemble species of oak and larch. There are, besides, lighter kinds of wood, similar to fir; not to mention logwood, mahogany, brasil, and an infinity of ornamental and dying woods. The government, however, according to its usual system, as soon as it appeared that profits were likely to be derived from timber, assumed to itself the exclusive monopoly of that article. The consequence is, that every person who becomes proprietor of a forest, begins with destroying all the finest of the trees, which would otherwise be seized by the intendant, whose odious visits it is desirable to avoid. Notwithstanding this oppressive system, excellent vessels are still built in

Brasil, at about half the price which they would cost in Europe. The privilege which Britain has obtained, of cutting timber from these noble forests, and of building ships on the spot, may thus prove of incalculable importance.

Sugar is cultivated to a great extent in Brasil. In the time of Pirard, about the middle of the last century, it formed the principal riches of the country. In the course of 150 leagues along the coast, from 25 leagues beyond Fernambuco, to 25 leagues beyond the bay of All Saints, Pirard counted above 400 sugar mills, each of which manufactured annually about 100,000 arobas of sugar.*

The number of cows produced in Brasil is so great, that they are, for the most part, slaughtered merely for the sake of their skins, many thousands of which are annually exported. The immense number of carcases which are thus left to be devoured by birds and wild beasts, would afford room for an extensive trade in provisions, were not the salt trade prohibited by the monopolising spirit of the government.

In Bajo, near Cabo Frio, salt is gathered in such abundance, that whole ships might be loaded with it. "In the country of the Mines, or Minas Geraes," says Da Cunha, "salt becomes so indispensable a necessary, that not only men, but cattle, and other animals, require it for their food. In every place where a high mountain extends from the sea to the mines, salt must be given to the cattle, else they would often refuse their usual fodder. The fields, near these mines, produce, indeed, plenty of grass; but not salt enough to feed the cattle. Thus large tracts of land must be lost, or the cattle must have salt, which is much higher in price than they themselves.

It is remarkable, too, that, in the interior parts of these countries, where nature has impregnated the soil with salt, quadrupeds and birds flock together, to eat of this earth. A combination of so many animals, of various species and colours, in one single spot, and the different tones which they utter, exhibits a most diverting spectacle to the curious observer.

Salt, a product so indispensably requisite to keep and preserve meat and fish, is uncommonly dear in those parts. The quantity necessary to salt an ox, costs, in many places, twice or three times as much as the ox itself. Such too, is the case with fish. In the province of Rio Grande, a bullock costs 700 reis (about four shillings and sixpence English), a horse from 6 to 800 reis, the largest and fattest oxen 1600 reis per head (10 shillings and 8 pence,) a cheese weighing 9 pounds 160 reis (one shilling), a pound of butter 40 reis (three pence), &c.

The salt trade being prohibited throughout Brasil, the exclusive privilege for this useful branch of commerce is farmed out to one individual, who pays for it the sum of 48,000,000 of reis, every year, into the royal treasury. This farmer gets annually from Brasil ninety-six millions of reis, of which forty-eight millions go to the queen's treasury, and an equal sum remains for himself, his agents, and receivers, even after deducting all the principal expences of the salt, including freight and carriage. But much more considerable are the profits he draws from the inner parts of those districts, where the herds are more numerous,

* An araba weighs about 32 pounds French, and 4 arobas make a quintal.

the demand for salt consequently greater, and the price of that article enhanced in proportion to the expence of carriage over the many mountains which are there to be met with.

On account of the vast sum of money which is thus every year drawn from Brasil, for the sole purpose of enriching the individual to whom the salt trade has been farmed out, all the rest of the inhabitants of those countries are made losers; at least their gain is materially prejudiced by the monopoly.—The whole commerce of Portugal, indeed, is made to forfeit, by this abuse, infinite emoluments and advantages which would otherwise accrue to it, from a greater abundance of salt fish, butcher's meat, bacon, cheese, and butter, that would be preserved and brought to market. Thus the royal treasury, for the sake of the comparatively paltry consideration of forty-eight millions of reis a year, robs itself of much larger sums, which the duties on these products would fetch, but for the factitious dearness of salt."

There seems strong reason to believe, that wine might be produced abundantly in Brasil. At Bahia, the most delicious grapes are reared in the gardens of individuals; but the want of industry prevents their cultivation from becoming general, and the extreme heat presents even an obstacle to their being made into wine. About Rio Janeiro, however, which is nine leagues farther south, and above all in the mountainous districts, there seems no doubt that this important article might be produced in perfection. The government, however, adhering to their mean spirit of monopoly, have discouraged and even prohibited its production, in order that it may not interfere with the commercial interests of the mother country.

No situation can be better adapted for the whale fishery, than this coast, which every where abounds in these animals. Some are killed by large boats from the shore; but there is no proper provision, either for taking the whales, or for extracting the oil. If there were, this might be rendered an important branch of commerce.

It is mentioned in a curious manuscript, written in 1578, and recently published by Mr Southey, that tea was found wild in the neighbourhood of Bahia, of similar and equal quality to that of China. We have not found this mentioned by any of the modern relations, and the observation seems to have sunk into oblivion. If correct, however, the cultivation of a plant for which the demand in Europe is so ample, would open a copious source of wealth to Brasil.

Besides the productions we have mentioned, the part of Brasil called Amazonia, produces vanilla, coffee, cotton, and great quantities of cacao nuts, which, till lately, were the current money of the country.

The mineral productions of Brasil are even superior to those of its soil. The country, according to Andrada,* is divided into four mineral *comarcas* or districts, which, going from north to south, are, 1. St Joao del Rey; 2. Villa Rica; 3. Sabara; 4. Serro do Frio, or the Cold Mountains. This last district not only produces diamonds, but abounds in mines of iron, antimony, zinc, tin, silver, and gold. These mines were discovered by Antonio Soary, a Paulist, who first found out those of

gold. The diamonds were afterwards discovered in the Riacho Fundo, in the Rio da Peixe, in the Saguitinhonha, and in the Guarapara in St Pauls. These precious stones were supposed originally to exist in the mountains, but they are more easily found in a bed under the vegetable mould, disseminated and attached to a gangart, more or less compact and ferruginous. They are likewise often found in the soil of the mountains, in beds of ferruginous sand and pebbles, forming an ochraceous pudding stone, of the decomposition of emery and boggy iron ore. Beneath the pudding stone, or caschalo as it is called, there is a schistus, somewhat sandy, and sometimes there is an indurated ore of iron. The mines are farmed to individuals, and employ from seven to eight thousand negroes. They are near the little river of Millhoverde, not far from Villa Nova do Principe, in 7° of South Latitude, and 44° of West Longitude. Diamonds have also been found in Cayaba, and in St Pauls, but the mines have not been explored. The other mines are situated in the mountains, and among the sources of the numerous streams that flow into the river Tocantin on one side, and the Parana on the other. There are mines of gold as far in the interior as the river Cayaba, which runs into the Paraguay, and even near the river Itenas. According to M Pau,† the mines of Brasil have produced, from the time of their discovery till the year 1756, being 60 years, nearly 2,400,000,000 livres tournois, which at an average is about 40,000,000 livres tournois in a year.

In the neighbourhood of Bahia, in the direction of west south west, there are great mines of nitre, which have not yet been wrought.

As we are indebted to Bougainville for the most complete account of the diamond and gold mines of Brasil, we shall conclude this article with an extract from the voyage of that celebrated navigator.

"Rio Janeiro is the staple and principal outlet of the riches of Brasil. The mines called general, are the nearest to the city, at the distance of about seventy-five leagues. They yield to the king, every year, for his right of fifths, at least a hundred and twelve arobas of gold; in 1762 they yielded a hundred and nineteen. Under the captaincy of the general mines, are comprehended those of Rio do Morte, of Sabara, and of Serro-frio. The last, besides gold, produces all the diamonds that come from Brasil. They are found at the bottom of a river, of which they turn the course, in order to separate from the pebbles in its bed, the diamonds, topazes, chrysolites, and other stones of inferior quality.

Of all these stones, the diamonds alone are contraband: they belong to the undertakers, who are obliged to give an exact account of the diamonds found, and to place them in the hands of the intendant appointed by the king for this purpose, who deposits them immediately in a casket encircled with iron, and shut with three locks. He has one of the keys, the viceroy another, and the assayer of the royal treasury the third. This casket is enclosed in a second, sealed by the three persons above-mentioned, and which contains the three keys of the first. The viceroy has not the power of visiting its contents. He only consigns the whole to a third strong coffer, which he sends to Lisbon, after having set his seal on the lock. They are opened in the

* Actes de la Soc. Hist. Nat. de Paris. Paris, 1792.

† Recherches sur les Americains.

presence of the king who chooses what diamonds he pleases, and pays the price to the undertakers at the rate fixed by their agreement.

The undertakers pay to his most faithful majesty, the value of a piastre, Spanish money, each day, for every slave employed in searching for diamonds; and the number of these slaves may amount to eight hundred. Of all kinds of contraband trade, that of diamonds is the most severely punished. If the offender be poor, it costs him his life; if he has wealth sufficient to satisfy the law, besides the confiscation of the diamonds, he is condemned to pay twice their value, to one year's imprisonment, and is afterwards banished for life to the coast of Africa. Notwithstanding this severity, there is a great contraband of diamonds, even the most beautiful; the hope and ease of concealing them being increased by the small size of the treasure.

The gold drawn from the mines cannot be carried to Rio Janeiro, without being first brought to the smelting houses established in each district, where the right of the crown is received. What results to private persons is remitted in bars, with their weight, number, and the royal arms. All this gold has been assayed by a person appointed for this purpose, and on each bar is imprinted the standard of the gold; so that afterwards in the coinage the operation necessary to estimate their due standard may be easily performed.

These bars belonging to individuals are registered in the factory of La Praybuna, thirty leagues from Rio Janeiro. In this station are a captain, lieutenant, and fifty men: here is paid the right of fifths; and besides a toll of a real and a half per head on men, cattle, and beasts of burden. Half of the product of this duty belongs to the king, and the other half is divided between the detachment according to rank. As it is impossible to return from the mines without passing by this office, all persons are there stopped, and searched with the greatest severity.

Individuals are afterwards obliged to carry all the gold in bars, which belongs to them, to the mint of Rio Janeiro, where the value is given in coin, commonly in half doubloons, each worth eight Spanish dollars. Upon each of these half doubloons the king gains a dollar, by the alloy and the right of coinage. The mint of Rio Janeiro is one of the most beautiful which exists; it is furnished with every convenience to work with the greatest celerity. As the gold arrives from the mines at the same time that the fleets arrive from Portugal, it is necessary to accelerate the work of the mint, and the coinage proceeds with surprising quickness.

The arrival of these fleets renders the commerce of Rio Janeiro very flourishing, but chiefly that of the Lisbon fleet. That of Porto is only laden with wines, brandy, vinegars, provisions, and coarse cloths, manufactured in that city or its environs. Soon after the arrival of the fleets, all the merchandise brought is taken to the custom house, where it pays ten *per cent.* to the king. It is to be observed, that at present the communication of the colony of St Sacramento with Buenos Ayres being severely prohibited, these rights must experience a considerable diminution. Almost all the most precious articles were sent from Rio Janeiro to the colony of Sacramento, whence they were smuggled to Buenos Ayres into Chili and Peru; and this fraudulent commerce was worth every year to the Portuguese more than a million and a half of dollars. In a word,

VOL. IV. PART II.

the mines of Brasil produce no silver; all that the Portuguese possess is acquired by this contraband trade. The negro trade was also an immense object to them. It is impossible to compute the loss occasioned by the almost entire suppression of this branch of contraband trade. It occupied alone at the least thirty vessels in the coasting trade from Brazil to La Plata.

Besides the ancient right of ten *per cent.* paid to the royal custom-house, there is another of two and a half *per cent.* imposed under the title of free gift, since the disaster at Lisbon in 1755. It is paid immediately on leaving the custom-house, whereas a delay of six months is granted for the tenth, on giving good security.

The mines of St Paolo and Paruagua yield to the king four arobas for the fifths every year. The most distant mines, as those of Pracaton and Quiaba (Cuyaba,) depend on the captaincy of Matogrosso. The fifth of the above mines is not received at Rio Janeiro, but that of the mines of Goyas is deducted. This captaincy also possesses diamond mines, which are forbidden to be worked.

The whole of the expense of the king of Portugal at Rio Janeiro, for the payment of the troops and civil officers, and for the charges of the mines, the maintenance of the public buildings, the careening of vessels, amounts to about six hundred thousand dollars. The expenses of building ships of the line and frigates there stationed are not included.

Recapitulation, and the amount of the average of different objects of royal revenue.

	Dollars.
A hundred and fifty arobas of gold, the average produced by the royal fifths, are in Spanish money - - - - -	1,125,000
The duty on diamonds - - - - -	240,000
The duty on coinage - - - - -	400,000
Ten <i>per cent.</i> from the custom-house - - -	350,000
Two and a half <i>per cent.</i> of free gift - -	87,000
Right of toll, sale of employments, offices, and generally all the profits of the mines	225,000
Duty on slaves - - - - -	110,000
Duty on fish oil, salt, soap, and the tenth on the provisions of the country - - -	130,000
Total	2,667,000

From which, deducting the above expenses, it will be seen that the king of Portugal draws from Rio Janeiro, a revenue exceeding ten millions of French livres."

According to the author of the *Etat Present du Portugal*, there are 12 cities in Brasil, 66 towns, many villages; one archbishop, four bishops, and about 430,000 inhabitants, more than one sixth of whom are Portuguese.

See Southey's *History of Brasil*; Purchas's *Pilgrims*, vol. iv.; *Histoire Generale des Voyages*, vol. xiv.; Harris's *Voyages and Travels*, vol. ii.; Raynal's *East and West Indies*; Lindley's *Voyage to Brasil*; Barrow's *Voyage to CochinChina*, &c.; and *A Political Essay on the Commerce of Portugal and her Colonies, particularly of Brasil in South America*, by J. J. Da Cunha de Azeredo Coutinho, bishop of Fernambuco; London 1801.

BRASS, or LATTEN, a combination of zinc and copper, is produced by the fusion of the latter metal, and *lapis calaminaris*. It is capable of being wrought with great facility, and is applied to a variety of purposes in the arts.

It is of a beautiful yellow colour, more approaching to gold, and not so apt to tarnish or rust as copper. It is more ductile than either that metal or iron, and hence peculiarly fitted to be made into wire. As brass is in general used for mathematical and astronomical instruments, where the greatest precision is required, its expansion has been very accurately determined. It has been found to hold a middle place between its component metals—copper and zinc; and, according to Mr Smeaton, twelve inches in length of cast brass, at 30°, expanded by 180° of heat 225 ten thousandth part of an inch; while, in the same circumstances, hammered copper expands only 204, and zinc 353 parts. Its density is beyond the mean, and ought to be by calculation 7.6296, but is actually 8.3958. See EXPANSION.

This beautiful alloy was known at a very early period. It was first discovered from the singular circumstance of copper ore, and zinc earth, or *calamine*, sometimes called *cadmia* by the ancients, being found in one mine, and yielding, when melted, not pure copper, but metal of a yellow colour; and from its resemblance to gold, the mines which contained this ore were held in the highest estimation. It was, however, afterwards discovered, that a certain earth, when added to copper, when in the furnace, gave it a gold colour. This earth, which must have been *calamine*, is mentioned both by Aristotle and Strabo; and Pliny says, "*Ipsc lapis, ex quo fit æs, cadmia vocatur*;" and when speaking of the Marian brass, "*Hoc a Liviano (ære) cadmiam maxime sortet*."* Its use has been handed down through every century, and is still retained in the manufacture of brass. This discovery was no sooner effected, than the ancient method of procuring this metal was abandoned. Pure copper was first extracted from the ore, and then converted into brass by the addition of *calamine*. But as the art of making brass with *lapis calaminaris* was not well understood by the ancients, but cost them much trouble and expense, it was esteemed next to silver; and was reckoned little inferior to that metal, as we learn from Procopius, who says, "that brass, inferior to gold in colour, is almost equal to silver in value."† It was not considered as a distinct metal, but only a more valuable kind of copper; and hence we find that the word *æs*, which is generally translated brass, was used indifferently to denote either of the two metals. The term *orichalcum*, however, which is used by Pliny, was more definite; and Dr Watson has very satisfactorily shewn, that it was confined entirely to brass, while copper was called *æs cyprum*, and by later writers *cuprum*. But the mines which produced the *orichalcum* of Pliny were exhausted in his time "*Nec reperitur longo jam tempore, effata tellure*;"‡ as also the Sallustian mine in Savoy, and the Livian mine in France; and the best brass then in use, was the Marian, called also *æs cordubense*, which was found in Spain.

In modern times, considerable improvements have been made in the manufacture of this metal; and some

secrecy is observed by those who have the reputation of making the finest article. This manufacture is carried on in most countries, but no where is brass made more extensively or better than in England, where both the materials are found of the first quality, and in great abundance. The operation of making this metal is very simple, as will appear from the following short description. The native *calamine*, after the short process of calcination, is ground in a mill, and mixed at the same time with about a fourth part of charcoal. This mixture is put into large cylindrical crucibles, with alternate layers of copper, cut in small pieces, or in the form of shot. Powdered charcoal is then thrown over the whole, when the crucibles are covered and luted up. The furnace has the form of a cone, with the base downwards, and the apex cut off horizontally. The crucibles are placed upon a circular grate, or perforated iron plate, at the bottom, with a sufficient quantity of fuel thrown round them, and a perforated cover, made of bricks or clay, is fitted to the mouth, which serves as a register to regulate the heat. After the copper is supposed to be sufficiently penetrated with the zinc (the time varying in different works from ten to twenty hours, according to the nature of the *calamine*, and the size of the crucibles), the heat is increased in order to fuse the whole down into one mass, when the crucibles are removed, and the melted brass poured into moulds, and then manufactured in the same way as copper plate. When the materials are good, a single fusion is sufficient to make good malleable brass; but the finest sorts undergo a second operation with fresh *calamine* and charcoal. Though the process in all cases is nearly the same, yet there is some variation in the proportion and choice of the ingredients. In this country, the proportions in weight are about 40 parts of copper, and 60 of *calamine*, with a sufficient quantity of charcoal; in Sweden, 40 of copper, 30 of old brass, and 60 of *calamine*; in France, 35 of copper, 35 of old brass, 40 of *calamine*, and from 20 to 25 of charcoal. At Goslar, in Saxony, the *cadmia*, or sublimed oxide of zinc, is used instead of the native *calamine*; and the proportions are 30 parts of copper, from 40 to 45 of *cadmia*, with double the volume of charcoal.

The use of brass seems to have been very prevalent among the ancients. Most of their arms were composed of this metal, as appears from Homer, who in his description of the Greeks, calls them *χαλκοχιτώνες Ἀχαιοί*, *brass coated Greeks*; and we are expressly told by Hesiod, that brass was in general use before even iron was known.

Τοῖς δ' ἦν χάλκεα μὲν τεύχεα, χαλκοὶ δὲ τε οἶκοι
Χαλκῶ δ' εἰργάζοντο, μέλας δ' ἔκ' ἔσκε σίδηρος §

Their houses brass, of brass the warlike blade;
Iron was yet unknown, in brass they trade.

The Arundelian marbles also assert the same thing, and are followed by Lucretius.

§ Oper. et Dieb. lib. i.

|| De Natura Rerum, lib. v.

Most of the arms and instruments found in Herculaneum, Stabæa, Pompeia, &c. whether culinary, mechanical, or agricultural, were made of brass, while those of iron were comparatively very few. It may be observed, however, that most of the genuine relics of this kind approach nearer to bronze than to our modern brass, and appear to be composed of various mixtures of brass with tin and other metals.

The Corinthian brass, so famous in antiquity, is a mixture of gold, silver, and copper, and is supposed to have been produced by the fusion of these metals, in which that city abounded, when it was sacked and burned by Lucius Mummius, in the 156th Olympiad, about 146 years before the Christian æra. Of this valuable metal, however, very little is known. Its æra of being in use must have been very short, as we are told by Pliny that the art of making it had been for a long time utterly lost; * and no remains of it are now in existence.

The most celebrated and finest modern brass is made at Geneva. It unites great beauty of colour to a high degree of ductility, and is used chiefly for escapement wheels, and other nicer parts of watchmaking. See Beckmann's *History of Inventions*, vol. iii. p. 72, &c.; Thompson's *Chemistry*, vol. i. p. 172; Pinkerton's *Essay on Medals*, vol. i. p. 133; Watson's *Essays*; and Pliny's *Nat. Hist.* lib. xxxiv. See also CHEMISTRY. (L)

BRASSICA, a genus of plants of the class Tetradymania, and order Siliquosa. See BOTANY, page 262, and GARDENING. (W)

BRAVA, BRAVO, or ST JOHN, one of the Cape de Verd Islands, is about four leagues in circumference, and lies in North Lat. 15° 25', and nearly 430 miles west from Cape de Verd. The land is high, and the mountains appear at a distance like pyramids rising from the ocean. These are little better than barren rocks, but the vallies are covered with a light soil, which produces maize, gourds, water-melons, and potatoes. Cotton is also a production of this island; and it is even said by some travellers, that it furnishes excellent wine, equal to that of the Canaries, and that oranges and lemons grow here in great abundance. Horses, cows, asses, and hogs, are in great plenty, particularly the hogs, as the islanders never eat the flesh of these animals except on feast days. Wild goats, which had been carried there by the Portuguese, and had multiplied prodigiously, are now almost extinct; and in order to preserve the species, a law is in force, whereby none are allowed to be killed but for the use of the governor. Brava abounds in saltpetre; and from the quantity of vitriolic springs, we may conclude, that this island is rich in metallic ores. As a proof of this, Mr Roberts assures us, that a clean knife, put into one of these springs, in less than a minute is covered with pieces of copper of a beautiful gold colour, and if it remain any time, and is then allowed to dry, the copper, when scraped off, falls like powder, while the knife retains the colour of gilt silver. Salt is here made in great plenty in the holes of the rocks, from the water which has been left by the ebbing of the tide, or carried thither by the negroes. Two or three hours of the sun's heat, in a clear sky, is sufficient for the operation; and it is surprising to see four bushels of salt drawn from a hole not above 12 or 15 feet in extent. It is evident, however, that certain rocks only have the

quality of hastening the formation of salt, while others have the quality of impeding it. In some, nothing remains after the exhalation of the water except a muddy sediment, but very salt, and sometimes only a very thin crust resembling that of cream of tartar.

This island was first discovered by the Portuguese, and for many years two negro families were its only inhabitants, until 1680, when a famine having afflicted the island of Fuego, some of the poorer inhabitants were driven by want to seek for refuge in Brava. They were received with joy by the negroes, who supplied them with every necessary of subsistence, and even shared with them their cattle, which was their only wealth. The number of inhabitants now amounts nearly to 500. The more industrious of these live by agriculture and the feeding of cattle, while the indolent languish in extreme poverty, and subsist chiefly on wild figs. Commerce is here completely neglected, and though this island is better fitted as a place of refreshment for ships to water and take in provisions than the island of St Jago, which is in general preferred, yet, for the space of seven years, two foreign vessels only have entered the island of Brava. It has several commodious bays and roadsteads, the principal of which are the bay of Faciend de Agna, on the north-west: on the south-west the bay of Ferriere, which has excellent anchorage, and is very safe during the months of March, April, and May; but is exposed, particularly in the three winter months, to the violent gusts which come from the vallies, and to the south-east and south south-west winds, which blow very strong during the rainy seasons. The bay of Fuerno is the best of the three, but is less frequented than the bay of Ferriere only because less known. See Sir George Staunton's *Embassy to China*, vol. i. p. 136, and Peuchet *Dictionnaire*, &c. (L)

BRAVA, supposed to have been the *Essina* of Ptolemy, is a small independent state of Africa, lying between the coasts of Zanguebar and Ajan. It is under the protection of the Portuguese, to whom it pays an annual tribute of 400 pounds weight of gold, and is said to have been first established by seven brothers, who had been driven from Arabia Felix by the tyranny of their sovereign. The capital stands on a beautiful bay at the mouth of a river, about 100 miles south west of Magadoxo, and most conveniently situated for commerce. It is well built and strongly fortified, and was formerly considered as one of the most celebrated and best frequented marts on that coast. But having resisted the payment of their tribute, the Portuguese admiral, Tristran de Cugna, laid siege to the city in 1508, which, after a severe and bloody conflict, was taken, plundered, and burnt to the ground. From that time Brava has never been able to recover its former eminence as a place of trade. It is still, however, inhabited by many wealthy merchants, who carry on a considerable traffic in gold, silver, silk, cotton and other cloths, elephants teeth, and various kinds of drugs, particularly ambergris, which is very plentiful on the coast of Brava. The people generally dress in the Portuguese manner, and consume great quantities of European commodities. North Lat. 1° 10', East Long 44°. See Peuchet *Dictionnaire*, &c. (L)

BREACH. See GUNNERY, and MILITARY TACTICS.

BREAD, a nutritive substance, made of corn or other farinaceous vegetables, ground into flour or meal,

and kneaded with water, generally with the addition of leaven or yeast.

However indispensable bread may now appear as an article of food, the art of baking was by no means an early discovery; and even at present there are some savage nations to whom it is altogether unknown. The fertility ascribed by the poets to the golden age, when the earth spontaneously offered corn and every thing necessary to the subsistence and comfort of man, is only so far fabulous, as they assign to one spot, or to every portion of the globe, the blessings which were scattered up and down through various and remote parts of its whole extent. It is perfectly evident, that no cultivation could create a single grain; and of course, that every species of corn must have originally been the spontaneous production of some region of the earth. Yet as these corns, previous to cultivation, would grow in small quantities, their importance as articles of food, might long escape observation; and mankind would in the mean time subsist on the more obvious and plentiful, though less nutritious vegetables, which were within their reach. According to the prevailing traditions of almost every country, acorns and berries appear to have constituted the chief vegetable food of the primæval race of men. This state of simplicity and ignorance continued for several ages, till, according to the obscure intimations of the Grecian fabulists, Ceres descended from heaven, to direct mankind to the use of corn, and to teach them the art of agriculture. Pliny informs us, (*Nat. Hist.* l. xviii. c. 7.) that barley was the only species of corn at first used for food; and even after the method of reducing it to flour had been discovered, it was long before men attained the art of baking it into bread.

At first, they seem to have contented themselves with boiling their flour or meal into a kind of porridge or pudding; and when at length they became acquainted with the method of kneading it into dough, their bread was nothing more than a kind of tough unleavened cake. The baking of these cakes, instead of being left to any particular set of men, as a distinct profession, was one of the principal concerns of the matrons. In those rude ages, when the prince himself slaughtered the lamb, which was to supply his table, the most dignified ladies did not disdain to employ their fair hands in kneading the dough. In this first stage of the art of baking, the use of ovens was unknown; and the cake, when properly kneaded, was toasted either on a warm-hearth, or on a gridiron.

Ovens were first invented in the East. Their construction was understood by the Jews, the Greeks, and the Asiatics, among whom baking was practised as a distinct profession. In this art, the Cappadocians, Lydians, and Phœnicians, are said to have particularly excelled. It was not till about 680 years after the foundation of Rome, that these artisans passed into Europe. The Roman armies, on their return from Macedonia, brought Grecian bakers with them into Italy. As these bakers had handmills beside their ovens, they still continued to be called *pistores*, from the ancient practice of bruising the corn in a mortar; and their bakehouses were denominated *pistoria*. In the time of Augustus there were no fewer than 329 public bakehouses in Rome; almost the whole of which were occupied by Greeks, who long continued the only persons in that city acquainted with the art of baking good bread.

In nothing, perhaps, is the wise and cautious policy of the Roman government more remarkably displayed, than in the regulations which it imposed on the bakers within the city. We have already observed, (see *BAKING*.) that to the foreign bakers, who came to Rome with the army from Macedonia, a number of freedmen were associated, forming together an incorporation, from which neither they nor their children could separate, and of which even those who married the daughters of bakers were obliged to become members. To this incorporation were given all the mills, utensils, slaves, animals, every thing, in short, which belonged to the former bakehouses. In addition to these, they received considerable portions of land; and nothing was withheld, which could assist them in pursuing, to the best advantage, their labours and their trade. The practice of condemning criminals and slaves, for petty offences, to work in the bakehouse, was still continued; and even the judges of Africa were bound to send thither every five years, such persons as had incurred that kind of chastisement. The bakehouses were distributed throughout the fourteen divisions of the city, and no baker could pass from one into another without special permission. The public granaries were committed to their care; they paid nothing for the corn employed in baking bread, that was to be given in largess to the citizens; and the price of the rest was regulated by the magistrates. No corn was given out of these granaries except for the bakehouses, and for the private use of the prince. The bakers had besides private granaries, in which they deposited the grain, which they had taken from the public granaries for immediate use; and if any of them happened to be convicted of having diverted any portion of the grain to another use, he was condemned to a fine of five hundred pounds weight of gold.

Most of these regulations were soon introduced among the Gauls; but it was long before they found their way into the more northern countries of Europe. Borrichius informs us, that in Sweden and Norway, the only bread known, so late as the middle of the 16th century, was unleavened cakes kneaded by the women. At what period in our own history the art of baking became a separate profession, we have not been able to ascertain; but this profession is now common to all the countries in Europe, and the process of baking is nearly the same in all.

Before we proceed to describe the method of making bread now generally practised, it may not be improper to give some account of the various kinds of bread made use of by the ancients. The Romans distinguished their bread by various denominations, according to its various qualities. 1. The finest kind, like our white bread, was made of the purest flour, from a species of wheat called *siligo*, held in very high estimation. The *siligo* of Italy was superior to all others, and the best bread was made of a mixture of *siligo* of Campania, the colour of which inclined to yellow, with the *siligo* of Pisa in Etruria, whose colour was exceedingly white. This bread was called *panis siliginæus*, and sometimes *panis mundus*, *athleticus*, *isungia*, *coliphius*, and *robys*. As its price was high, it was used only by the richest class of citizens. 2. Next in purity to this, was the *panis secundus*, called also *amilaceus* or *amilagineus*, which was made of the finest flour, with a slight admixture of bran. 3. The next kind was the *autophyrus*, sometimes named *syncomastus*, and *confusaneus*, made, like our household bread, of the whole substance of the wheat,

without retrenching either the finer flour, or coarser bran. 4. The worst kind of all, was that called *panis sordidus*, or *cacabaceus*, so wretchedly bad as to be fit only for dogs; it consisted chiefly of bran, from which circumstance it was called *furfuraceus*, *furfureus*, or *furfurativus*; in the middle ages it was called *bissus*, on account of its brownness; and sometimes also *leibo*.

Other kinds of bread were distinguished by particular names, derived either from the uses to which they were applied, or the manner in which they were made. Such were, 1. *Panis militaris*, or soldiers bread, which was in general very coarse and ill-baked. The state merely furnished the soldiers with corn, and left them to prepare it as they pleased. For this purpose, they were generally provided with handmills, in which having ground their corn very coarsely, or in the want of handmills, having bruised it in a mortar, or between two large stones, they kneaded it with their own hands, and baked it upon the coals. We are told by Herodian, that the emperor Caracalla, when along with his army, ate no other bread than that which he himself had baked. "Triticum enim sua manu molens, quod ipsi satis esset, massamque ex eo conficiens, et in carbonibus coquens, eo vescabatur." 2. *Panis civilis* was the bread which, in the latter days of the empire, was distributed to the people, in lieu of the corn which they had formerly been accustomed to receive. This custom seems to have been first introduced by Aurelian. The loaves which he caused to be baked in this manner weighed 25 ounces, and each of the citizens received one of these loaves daily. Succeeding emperors increased their weight to thirty-six ounces; and under Theodore they were made of six ounces each, six of which were given instead of a large one as formerly, so that the allowance to the people continued the same. From their round shape, these loaves were sometimes called *corona*, crowns. This bread was likewise called *panis fiscalis*, because it was paid out of the treasury; and *panis dispensatorius et gradilis*, either because it was distributed from an elevated place, or because the people were ranged on the steps of the amphitheatre, or on steps raised on purpose in the market place at Rome, as Constantine the Great caused to be done at Constantinople. 3. *Clibanites*, bread baked in an oven, by way of contradistinction to the, 4. *Subcineritius*, or *sub cinere coctus*, that baked under the embers, which was sometimes also called *reversatus*, because it was necessary to turn it in baking. There was likewise, 5. The *panis nauticus*, or naval bread, which answered to our sea biscuit, and was called also *bis coctus*, twice baked, whence the modern word biscuit is derived. 6. *Panis madidus*, was a kind of bread which the Romans used as a cosmetic for preserving the freshness of their complexion, and which they put upon their faces in the form of a mask. This bread was made of the flour of beans and the purest wheat. 7. *Panis acidus* was a sour bread acidulated with vinegar. 8. *Panis azymus* was bread without leaven, which Celsus has pronounced very good for the stomach. Two entire loaves, which are still preserved, were found in Herculaneum. Each of these loaves is about a palm and a half in diameter, and about five inches thick. They have both eight cuts or lines on the back; that is to say, they are first divided into a cross, the four parts of which are intersected by other lines. The ancient Greeks marked their loaves in the same

manner, and hence they are called by Hesiod *οκτάγραμοι*, with eight lines, but sometimes the loaves were divided only in the form of a cross, and they were then denominated *quadra*, a square, and among the Greeks *τετραεταρος*, divided into four pieces. Hence the phrase, *aliena vivere quadra*, to live at another's table. The reason of marking them in this manner seems to have been, that they might be the more easily broken and divided.

The French, who particularly excel in the art of baking, have a great many different kinds of bread. Their *pain bis*, or brown bread, is the coarsest kind of all, and is made of coarse groats mixed with a portion of white flour. The *pain bis blanc* is a kind of bread between white and brown, made of white flour and fine groats. The *pain blanc*, or white bread, is made of white flour, shaken through a sieve after the finest flour has been separated. The *pain mollet*, or soft bread, is made of the purest flour without any admixture. The *pain chaland*, or customers bread, is a very white kind of bread, made of pounded paste. *Pain chapelé*, is a small kind of bread, with a well beaten and very light paste, seasoned with butter or milk. This name is also given to a small bread, from which the thickest crust has been removed by a knife. *Pain de chapitre* is a superior kind of *pain chapelé*. *Pain cornu*, is a name given by the French bakers to a kind of bread made with four corners, and sometimes more. Of all the kinds of small bread, this has the strongest and firmest paste. *Pain a la reine*, queen's bread, *pain a la Sigovie*, *pain chapelé*, and *pain cornu*, are all small kinds of bread, differing only in the lightness or thickness of the paste. The *pain de Gonesse* is said to excel all others, on account of the quality of the water of Gonesse, about three leagues from Paris. In addition to these different kinds of bread, we may mention the *pain d'épice*, or spice bread, made of barley meal, seasoned with spices, and kneaded with the scum of sugar, and generally with yellow honey. This spice bread appears to have been known to the ancients, particularly the Asiatics. The Rhodians, we are told, had a kind of bread sweetened with honey, so exquisitely pleasant, that it was eaten with other delicacies, after dinner, by way of desert.

In this country (Britain) we have fewer varieties of bread, and these differ chiefly in their degrees of purity. Our *white* or *fine bread* is made of the purest flour; our *wheaten bread*, of flour with a mixture of the finest bran; and our *household bread*, of the whole substance of the grain without the separation either of the fine flour or coarse bran. We have also *symnel bread*, *manchet* or *roll bread*, and *French bread*, which are all made of the purest flour from the finest wheat; the roll bread being improved by the addition of milk, and the French bread by the addition of eggs and butter. To these may be added *gingerbread*, made of white bread, with almonds, liquorice, aniseed, rose water, and sugar or treacle; and *mastix bread*, made of wheat and rye, or sometimes of wheat and barley. We have various kinds of small bread, having various names, according to their various forms. They are, in general, extremely light, and are sweetened with sugar, currants, and other palatable ingredients. In Scotland we have a bread called *short bread*, which is a pretty thick paste, made with flour and butter, and generally sweetened with sugar, and seasoned with orange peel and various kinds of spices.

The process of making bread is nearly the same in

all the countries of modern Europe; though the materials of which it is composed vary with the farinaceous productions of different climates and soils. The flour of wheat is most generally employed for this purpose, wherever that vegetable can be reared. This flour is composed of a small portion of mucilaginous saccharine matter, soluble in cold water, from which it may be separated by evaporation; of a great quantity of starch, which is scarcely soluble in cold water, but capable of combining with that fluid by means of heat; and an adhesive grey substance called gluten, insoluble in water, ardent spirit, oil, or ether, and resembling an animal substance in many of its properties. Flour, kneaded with water, forms a tough indigestible paste, containing all the constituent parts which we have enumerated. Heat produces a considerable change on the glutinous part of this compound, and renders it more easy of mastication and digestion. Still, however, it continues heavy and tough, compared with bread which is raised by leaven or yeast. Leaven is nothing more than a piece of dough, kept in a warm place till it undergoes a process of fermentation; swelling, becoming spongy, and full of air bubbles, and at length disengaging an acidulous and spirituous vapour, and contracting a sour taste. When this leaven is mingled in proper proportions with other dough, it makes it rise more readily and effectually than it would do alone, and gives it at the same time a greater degree of firmness. Upon the quality of the leaven employed, the quality of the bread materially depends. To obtain it in its proper state, it ought to be remembered, that good leaven is dough which has fermented and become sour, but is yet in its progress towards greater acidity. If it be permitted to acquire all the sourness of which it is susceptible, it begins to putrify, and has a very different effect upon the dough from that which is produced by leaven in the proper state of fermentation. If dough or paste be left to undergo a spontaneous decomposition in an open vessel, the component parts are affected in different ways; the saccharine part is converted into an ardent spirit, the mucilage tends to acidity and moulding, and the gluten verges towards putridity. This incipient fermentation makes it more light and digestible, and by disengaging the confined air, renders it more porous, and considerably enlarges its bulk. Baking puts a stop to this process, by evaporating a great part of the moisture, which favours the chemical attraction, and perhaps by changing still farther the nature of the component parts. In this state, however, bread will not possess the requisite uniformity; for some parts may be mouldy, while others remain in the state of dough. To promote uniform fermentation, is the great use of leaven. A small portion of it is intimately blended with a quantity of other dough; and this, by its union with the mass, and the aid of a gentle heat, accelerates the fermentation, which it promotes through the whole mass at once; and as soon as the dough has acquired a due increase of bulk from the carbonic acid gas, which endeavours to escape, it is judged to be sufficiently fermented, and fit for the oven; the heat of which, by driving off the water, checks the fermentation. By the fermentation of the dough, mixed with leaven, a quantity of carbonic acid gas is extracted from the flour, but remains confined by the tenacity of the mass, in which it is expanded by the heat, and thus raises the dough. This is also the cause of the porosity or sponginess of baked bread.

From the scripture history, we learn that the practice of making leavened bread was common from a very remote antiquity; so common, indeed, that among the Jews at least, unleavened bread seems never to have been used, except in sacrifices and solemn festivals, or when circumstances rendered it impossible to have bread prepared in the usual way. It seems probable from some particular allusions, (Luke xiii. 21. 1 Cor. v. 60.) that the Jewish bakers were in the practice either of keeping their leaven too long, or of substituting in its stead something which was supposed injurious to health. Without great care, indeed, bread fermented by leaven will have a sour and disagreeable taste. The French, who pay particular attention to the quality of their bread, are extremely careful, both with regard to the kind of leaven which they employ, and the quantity of it which they mix with their dough. *Levain de Chef*, or principal leaven, is the portion of the dough which is left to ferment till the next opportunity of baking. This dough is generally kept in a kneading trough, that it may not be too much exposed to the air, or to the sun, or to the frost, so that its fermentation may neither be too rapid nor too slow. When it has exceeded the due degree of fermentation, it becomes necessary to freshen it, which is done by mixing it with new paste or dough, and this is called *levain rafraichi*, freshened leaven. This operation, perhaps the most important in the art of baking, consists in mixing with the first leaven half its weight of warm water. Thus if the first leaven weigh eight ounces, take four ounces of water; soak the leaven very carefully in the water, and mix flour with them by degrees, so as to form a good paste. This second or freshened leaven may be renewed once or twice; but after being renewed for the last time, it ought to be used within three hours. One general rule must constantly be observed, namely, to manage the leaven in such a manner, that, from the first to the last, there may always be continued a fermentation, which becomes sweeter in every stage of the process. After this, all that remains to be done is to mix two-thirds or one-half of flour with this leaven, to soak it well, so that it may be gradually incorporated with the flour, and thus form the dough or paste of bread. It is sufficiently kneaded when it is equally firm throughout, and does not adhere to the hands.

The degree of kneading necessary depends much upon the season of the year. In winter, it is better to employ more leaven, and to knead it less; in summer, on the contrary, less leaven is necessary, with more labour.

With regard to the proper temperature of the water, the hand of the experienced baker can easily decide. So far as it can be determined by any certain point, it ought to be about 30° of Reaumur's thermometer in summer and spring; and in winter a little warmer. Care must be taken, however, not to make it boil, for water which has boiled, even though afterwards cooled, has lost part of the air which is necessary for the fabrication of good bread.

Nothing in the art of baking is more essential than to have a due proportion of flour and water. That proportion, however, cannot be regulated by any certain rules; for it varies with the diversity of soil, climate, years, seasons, and grinding. There are some kinds of flour which imbibe precisely three-fourths of their weight of water; and others which imbibe only half

their weight. That flour is always best which imbibes the greatest quantity of water; of course the method of discovering the quality of flour is abundantly simple. Merely take a certain quantity of flour, and observe how much water it requires to make a good paste. Bread made of good flour, is about five-sixteenths heavier than the quantity of flour which it contains; of coarse it retains nearly one half of the water employed in forming the dough. These results, however, are by no means uniform: they depend not only on the quality of the flour, but on the manner of employing it, on the skilful regulation of the heat of the oven, and a variety of other circumstances. Another material observation is, that bread without salt is heavier than that which is salted. Salt makes the dough capable of receiving more water, and thus more bread is made with the same quantity of dough. It is of essential use in the fabrication of bread, as it makes it keep longer, and corrects the bad qualities of spoiled wheat.

The principal improvement which has been made on bread in modern times, is the substitution of yeast or barm in place of common leaven. This yeast is the mucilaginous froth that rises to the surface of beer, in the first stage of its fermentation. When mixed with the dough, it makes it rise much more speedily and effectually than ordinary leaven, and the bread is of course much lighter, and free from that sour and disagreeable taste, which may often be perceived in bread raised with dough leaven, either because too much is mingled with the paste, or because it has been allowed to advance too far in the process of fermentation.

Bread, properly raised and baked, differs materially from unleavened cakes, not only in being less compact and heavy, and more agreeable to the taste, but in losing its tenacious and glutinous qualities, and thus becoming more salutary and digestible.

The method of making household bread, practised by our bakers, is thus: To a peck of flour they add a handful of salt, a pint of yeast, and three quarts of water; the whole, being kneaded in a bowl or trough, will rise in about an hour; it is then moulded into loaves, and put into the oven. For French bread, they take half a bushel of fine flour, ten eggs, and a pound and a half of fresh butter, into which they put the same quantity of yeast with a manchet, and tempering the whole mass with new milk pretty hot, leave it half an hour to rise, after which they make it into loaves or rolls, and wash it over with an egg beaten with milk: care is taken that the oven be not too hot.

So far back as the reign of Henry III., we find mention made of wastel bread, cocket bread, and bread of treet, corresponding to the three sorts of bread now in use, called white, wheaten, and household bread. In religious houses they had various kinds of bread, distinguished by the names of *panis armigerorum*, or esquire's bread; *panis conventualis*, or monk's bread; *panis puerorum*, boy's bread; and *panis famulorum*, or *panis servientialis*, servant's bread. In the household establishment of the grandees, too, they had bread of various qualities and denominations; as the *panis nuntius*, or messenger's bread, which was given to messengers as a reward for their labour; *panis curialis*, or court bread, allowed by the lord for the maintenance of his household; and eleemosynary bread, distributed as alms to the poor.

We have hitherto considered bread as made of the

flour of wheat; but there are many other farinaceous vegetables, from the seeds or roots of which salutary and pleasant bread can be prepared. Oaten bread is common not only throughout Scotland, but likewise in Lancashire, and several of the northern counties of England. In this country (Scotland) we have likewise excellent bread made of barley meal; and pease bread, which, though much relished by many of our peasantry, is dry, heavy, and hard of digestion. In times of scarcity, many attempts have been made to compensate for the want of corn, by the substitution of other vegetable substances, in the fabrication of bread. For this purpose, recourse has been had to the herb *ragwort*, the thick root of which, when taken out of the ground, is soft and viscous, but becomes hard in a short time, and may be preserved in that state for years, without changing, or requiring the slightest care. This root is easily ground, and yields a fine flour, which has an agreeable taste resembling that of a nut. It is said likewise to be easily digested, and to be more nutritive and exhilarating than wheaten bread. The same properties and effects are attributed to radishes. From the acorn, too, a kind of meal is produced which makes excellent bread, provided that a little barley meal be mingled with it, to counteract its astringent qualities. In the wars of Westphalia, bread of this description was very commonly used; and when made with milk, was extremely pleasant and nutritious. The slightest preparation is sufficient to remove the harsh and disagreeable taste which the acorn has in its natural state. Roasting or boiling it is all that is requisite to render it quite palatable. This kind of bread has been recommended by physicians, especially for labouring people: the acorns that are best calculated for this purpose are those of the white oak. M. Parmentier, chief apothecary in the Hotel des Invalides, has published some beautiful and successful experiments on the vegetables which might be substituted in times of scarcity, for those usually employed for the nourishment of animals. Upon examining, with the most careful attention, what was the nutritive part of farinaceous vegetables, he discovered that it was their starch; and by a series of well conducted experiments, he ascertained the identity of the farina of plants with the starch of wheat. The vegetables from which he extracted this substance, are the bryony, the iris, gladiolus, ranunculus, fumaria, arum, dracunculus, mandragora, colchicum, filipendula, and helleborus, and the roots of the gramin caninum arvense. The process by which he extracted the farina or starch from these vegetables, is extremely simple. It is only necessary to cleanse the roots, to scrape and pound them, and then to soak the pulp in a considerable quantity of water: a white sediment is deposited, which, when washed and dried, is a real starch. M. Parmentier converted these different starches into bread, by mingling them with an equal portion of potatoes reduced into pulp, and the ordinary dose of wheaten leaven: the bread had no bad taste, and its quality was excellent. From his experiments it appeared, that it is chiefly the amylaceous matter or starch of grain that is nutritious; and that the nutritive quality of other vegetable substances, depends entirely on the quantity of that matter they contain. This amylaceous matter, formed into a jelly, and diffused in water, will keep a long time without undergoing any change. At length, however, it becomes arid and then putrefies.

A very good bread may be made of turnips by the following process: Let the turnips be washed clean, pared, and boiled. When they are soft enough for being mashed, the greater part of the water should be pressed out of them, and they should then be mixed with an equal quantity in weight of coarse wheat flour. The dough may then be made in the usual manner, with yeast or barm, salt, water, &c. It will rise well in the trough, and after being well kneaded, may be formed into loaves, and put into the oven. It requires to be baked rather longer than ordinary bread, and when taken from the oven is equally light and white, rather sweeter, with a slight but not disagreeable taste of the turnip. After it has been allowed to stand 12 hours, this taste is scarcely perceptible, and the smell has quite gone. After an interval of 24 hours, it cannot be known that it has turnips in its composition, although it has still a peculiar sweetish taste: it appears to be rather superior to bread made only of wheat flour, is fresher and moister, and even after a week continues very good.

Bread is sometimes made of millet, and, when warm, it is pretty good; when cold, it becomes dry, and easily crumbles, and is therefore preferred by painters for effacing their pencil marks. Though millet be nutritive when boiled, it is not so in bread, but becomes a very powerful astringent. From some passages in Pliny, it appears that this grain was in very common use among the Italian peasantry. There is no grain, he informs us, more heavy, or which swells more in baking. It affords the best leaven known, and would doubtless, make excellent beer.

Rice, though one of the roughest and driest of farinaceous vegetables, is converted by the Americans into a very pleasant bread. The process is as follows: The grain is first washed by pouring water upon it, then stirring it, and changing the water until it be sufficiently cleansed. The water is then drawn off, and the rice, after being sufficiently drained, is put, while yet damp, into a mortar, and beaten to powder; it is then completely dried, and passed through a common hair sieve. The flour, thus obtained, is generally kneaded with a small proportion of Indian corn meal, and boiled into a thickish consistence; or sometimes it is mixed with boiled potatoes, and a small quantity of leaven and salt is added to the mass. When it has fermented sufficiently, the dough is put into pans, and placed in an oven. The bread made by this process is light and wholesome, pleasing to the eye, and agreeable to the taste. But rice flour will make excellent bread, without the addition of either potatoes, or any kind of meal. Let a sufficient quantity of the flour be put into a kneading trough; and at the same time let a due proportion of water be boiled in a cauldron, into which throw a few handfuls of rice in grain, and boil it till it break. This forms a thick and viscous substance, which is poured upon the flour, and the whole is kneaded with a mixture of salt and leaven: the dough is then covered with warm cloths, and left to rise. In the process of fermentation, this dough, firm at first, becomes liquid as soup, and seems quite incapable of being wrought by the hand. To obviate this inconvenience, the oven is heated while the dough is rising; and when it has attained a proper temperature, a tinned box is taken, furnished with a handle long enough to reach to the end of the oven: a little water is poured into this box, which is then filled with

dough, and covered with cabbage leaves and a leaf of paper. The box is then committed to the oven, and suddenly reversed. The heat of the oven prevents the dough from spreading, and keeps it in the form which the box has given it. This bread is both beautiful and good; but when it becomes a little stale, loses much of its excellence.

Potatoes, mixed in various quantities with flour, make a wholesome, nutritive, and pleasant bread. Various methods are employed for preparing the potatoes. Kli-yogg, who has been styled the rustic Socrates, recommends, that potatoes well boiled and carefully peeled, should be put into a kneading trough, covered with boiling water, and bruised till they be converted into a kind of soup of equal consistence throughout. A half, a third, or a fourth, of this soup, mixed with the flour of wheat, makes a bread of an excellent taste, and extremely salutary and nutritive. This is the food of the peasantry in German Lorraine; and that country is thickly peopled, with young, tall, and handsome men, of the most robust and vigorous constitution. In Vogstand and in Saxony, potatoes are prepared for bread in the following manner: The largest potatoes are chosen, and after being peeled, are grated very fine, and put into a milk pail. Cold water is poured upon them, in which they are allowed to remain twenty-four hours. The water is then poured off, and fresh water is poured on them again; and this is repeated till the water which is drawn off be as pure as that taken from the spring. The potatoes are then put into a white linen cloth in order to be drained, after which they are spread upon a plate till dry. They are then reduced to a fine powder, and mixed with equal portions of wheaten flour, and with as much leaven as is usually employed for the same quantity of flour.

Bread may be made from the meal of potatoes alone, with the addition of salt or yeast; but it is heavy, brown, and apt to crumble into powder. To render it more adhesive. M. Parmentier mixed with the meal a decoction of bran, or a mixture of honey and water, either of which made it lighter, better coloured, well tasted, and sufficiently firm. He obtained, also, well fermented bread, of a good colour and taste, from a mixture of raw potatoe pulp, with meal of wheat, or potatoe meal, with the addition of yeast and salt. After repeated trials, he recommends the mixture of potatoes, in time of scarcity, with the flour of wheat, in preference to rye, barley, or oats; when no grain can be procured, he recommends the use of bread made from a mixture of the amylaceous powder of potatoes and their pulp, fermented with leaven or honey. The meal of potatoes, diluted with water, acquires a tenacious and gluey consistence. Bread, however, made of this meal, with the flour of wheat, has a grey colour; but that made of a mixture of the pulp of potatoes, with the flour of wheat, is sufficiently white. Parmentier made bread very much resembling that of wheat, by mixing four ounces of amylaceous powder of potatoes, one dram of mucilage extracted from barley, one dram of the bran of rye, and one-half dram of glutinous matter, dried and pounded into powder.

M. Dudit de Maizieres, a French officer of the king's household, invented and practised with the greatest success, a method of making bread of common apples, very far superior to potatoe bread. After having boiled one third of peeled apples, he bruised them, while quite warm, into two-thirds of flour, including the proper

quantity of leaven, and kneaded the whole without water, the juice of the fruit being quite sufficient. When this mixture had acquired the consistency of paste, he put it into a vessel, in which he allowed it to rise for about twelve hours. By this process he obtained a very sweet bread, full of eyes and extremely light.

The Norwegians make bread of barley and oatmeal, baked between two stones. This bread improves with age, and may be kept thirty or forty years. At their great festivals they use the oldest bread; and it is not unusual, at the baptism of a child, to have bread which had been baked at the baptism of the grandfather.

At Debretzin, in Hungary, excellent bread is made by the following process, without yeast: Two large handfuls of hops are boiled in four quarts of water; this is poured upon as much wheaten bran as it will moisten, and to this are added four or five pounds of leaven. When the mass is warm, the several ingredients are worked together till well mixed. It is then deposited in a warm place for twenty-four hours, and afterwards divided into small pieces, about the size of a hen's egg, which are dried by being placed upon a board, and exposed to a dry air, but not to the sun; when dry, they are laid up for use, and may be kept half a year. The ferment, thus prepared, is applied in the following manner: For baking six large loaves, six good handfuls of these balls are dissolved in seven or eight quarts of warm water; this water is poured through a sieve into one end of the bread trough, and after it three quarts of warm water; the remaining mass being well pressed out. The liquor is mixed up with flour sufficient to form a mass of the size of a large loaf; this is strewed over with flour: the sieve, with its contents, is put upon it, and the whole is covered up warm, and left till it has risen enough, and its surface has begun to crack: this forms the leaven. Fifteen quarts of warm water, in which six handfuls of salt have been dissolved, are then poured upon it through the sieve; the necessary quantity of flour is added, and mixed and kneaded with the leaven; this is covered up warm, and left for about half an hour. It is then formed into loaves, which are kept for another half hour in a warm room; and after that they are put into the oven, where they remain two or three hours, according to their size. One great advantage attends this kind of ferment, that it may be made in large quantities at a time, and kept for use; and, on this account, it might be convenient on board of ships, or in camps for armies in the field.

In the absence of any of the farinaceous vegetables which we have mentioned, various substitutes for bread have been employed in different parts of the world. By far the most valuable of these substitutes is the fruit of the bread tree, which is common in many parts of the East. It abounds particularly at Surinam, where extensive valleys may be seen of this tree alone, loaded with the most luxuriant crops of fruit. As this tree is to be described in a separate article, we forbear entering into any minute account of it at present, or of the manner in which it is prepared. See *BREAD Fruit Tree*. In Iceland, Lapland, Crim Tartary, and various parts in the north, a kind of bread is made of dried fish, beaten first into powder, and then made up into cakes. But the strangest substitute for corn that has ever been employed is a sort of white earth, found in the lordship of Moscow, in upper Lusatia, of which the poor, in times of famine, have frequently been compelled to make

bread. This earth is dug out of a hill where saltpetre had formerly been worked: when heated by the sun it cracks, and small globules proceed from it like meal, which ferment when mixed with flour. On this earth, baked into bread, many persons have subsisted for a considerable time. A similar earth is found near Geronne in Catalonia.

In the western parts of Louisiana, too, the savage inhabitants have a strange custom of eating a white earth, or clay, with salt. This custom they seem to have borrowed from the example of the wild cattle, goats, and even turkies, which eat earth of a similar description in the salt-pits of that country. The rowers, too, who ply on the river Mississippi, frequently drink such quantities of muddy water, as cannot fail to leave in their stomach a considerable residuum of earth. These facts suggested to M. Buchoz, that an European might, without danger imitate, in this respect, the example of the Americans. To put this idea to the test of experiment, he ate a large piece of clay, kneaded with a little brine. He found it rather unpleasant to the taste, but followed by no bad consequences. He tried to render it pleasanter and more nutritious. The result of his experiments was, that gum-water, glue, the fresh juice of fruits, the paste and the decoction of the roots of marsh-mallows, succeeded equally well in forming, with this clay, a good and very nutritive bread. "I doubt not," continues he, "that, with the aid of a little leaven, and long trituration, a mineral bread might be made, which would prove the greatest resource in time of famine." It is difficult to believe that any kind of earth can be a nutritive food; yet, it is certain, that several nations, and particularly the negroes, are accustomed to eat some species of earths found in their country, the want of which, when absent from home, they bitterly regret. It seems probable, however, that they employ these earths, not as aliments, but merely as tonics, to rectify the stomach, and to restore its powers. The continued use of it, even for a short time, would, in all probability, be deleterious.

What kind of bread is the most nutritive and wholesome, is a question which has occasioned much discussion among physicians. The whole tribe of *cerealia*, that is, of the gramineous or culmiferous plants employed as the food of men, contain a farinaceous substance of a similar nature. Different species of these *cerealia* are employed in different countries, with nearly the same benefit, according to the facility of cultivating them in certain soils and climates. There is, however, some difference in the qualities of the *cerealia*, which deserves to be mentioned. *Barley*, which contains in its farina a smaller proportion of oil than some other grains, is found, accordingly, to be less nourishing. This is ascertained by the experience of our peasantry, as well as by experiments upon brutes, which are not found to derive equal nourishment from the same quantity of barley as of oats. *Rye*, which, on being decocted in water, yields three-fourths of its weight of mucilage, may be presumed to be sufficiently nourishing. Water, when trituated with it, acquires no milkiness, which shews that its oil is at least under a peculiar combination; and if it really contains a due portion of oil, it is difficult to explain why it should be, of all the *cerealia*, the most ascetic. These peculiarities might seem to detract from its nourishing quality, were not this sufficiently established by the experience of all the north-

ern nations on the continent. With us it is little employed as an aliment; and people unaccustomed to it generally find it laxative. *Rice* is proven, by the experience of all Asia, to be sufficiently nourishing; nor does its nutritious matter seem to be attended with any noxious quality. "It has been supposed," says Dr Cullen, "among physicians, to be possessed of some drying or astringent quality, and has therefore been commonly employed in diarrhoea and dysentery, preferably to the other farinacea: but this opinion I take to be groundless; for it does not give any mark of astringent quality with the vitriol of iron; and if it has ever been found useful in diarrhoea, it must, as Spielmann properly judges, be owing entirely to its demulcent power; which, however, is not stronger in it, than in several others of the farinacea." *Oats* are used by many people in the north of Europe as a farinaceous food, but particularly by the people of Scotland, and its nutritive qualities are sufficiently known. Various, and indeed contrary, mistakes, however, have been formed concerning it. The French suppose it to be refrigerant, but it is merely so as being a vegetable aliment not heating. The English vulgar, from its tendency to produce a slight heartburn, have supposed it to be heating; and, from a mistake with regard to the state of diseases, have imagined it the cause of cutaneous affections, not more frequent in Scotland than in other countries. The heat at the stomach is owing to the acescency which oat bread, commonly unfermented, is apt to occasion; and, unfermented bread of wheat meal is liable to give the same heartburn and sense of heat at stomach. *Maize*, which is entirely an American grain, affords a farina of the best quality, and extremely nourishing both to men and brutes. By itself, or even with yeast, it does not ferment so well as to give a light bread; but it may be made into a very perfect bread, by being mixed, in pretty large proportions, to the flour of wheat. All these farinaceous substances which we have mentioned, may be made indeed into bread; but in many cases the bread so prepared is less dry and friable, less miscible therefore with the saliva and with our other food, and perhaps less wholesome than might be desired. Acescent fermentation is the only effectual means of correcting these imperfections. It drives off a large quantity of the fixed air; but as a portion of it still remains diffused, the mass is swelled into a larger bulk; and, when heat is applied, the bread formed is of a more spongy texture, more tender, friable, and more miscible with the saliva and our other food. Complete fermentation, however, cannot be given to any of the farina except wheat, of which alone, therefore, by its own spontaneous fermentation, the most perfect bread can be formed. When the discovery of the circulation of the blood led physicians to consider obstruction as a principal cause of disease, they were ready, at the same time, to suppose a certain state of the fluids to be the chief cause of obstruction. Dr Boerhaave has given the *glutinosum lingue* as one of the simple diseases of the fluids; the first cause of which he ascribes to the use of unfermented farinacea. "In entering upon the consideration of this," says Dr Cullen, "we are willing to own, that a farinaceous substance, formed by fermentation into a perfect bread, is the most wholesome condition in which farinaceous substances can be employed as a part of our food; and we are also ready to allow, that the unfermented farinacea, taken in im-

moderate quantity, especially at a certain period of life, or in dyspeptic stomachs, may be the cause of disease: but all this seems to have been exaggerated; for the morbid effects of unfermented farinacea are truly rare occurrences; and, indeed, the same unfermented farinacea are, for the most part, very well suited to the human economy. However considerable the use of fermented bread may be, the use of unfermented farinacea is still very great and considerable amongst almost every people of the earth. The whole people of Asia live upon unfermented rice; and I believe the Americans, before they became acquainted with the Europeans, employed, and for the most part still employ, their maize in the same condition. Even in Europe, the employment of unfermented bread, and of unfermented farinacea in other shapes, is still very considerable; and we are ready to maintain, that the morbid consequences of such diet are very seldom to be observed. In Scotland, nine-tenths of the lower class of people, and that is the greater part of the whole, live upon unfermented bread, and unfermented farinacea in other forms, and at the same time I am of opinion, that there are not a more healthy people any where to be found. In the course of fifty years that I have practised physic amongst them, I have had occasion to know this; and have hardly met with a disease of any consequence that I could impute to the use of unfermented farinacea. Physicians, who represent these as a noxious matter, must at the same time acknowledge, that in every country in Europe it is often used with perfect impunity. To obviate, however, the conclusion I would draw from this fact, they alledge that it is only safe when used by robust and labouring people; but we give it in this country, not only to the farmer's labouring servants, but to our sedentary tradesmen, to our women, and to our children; and all of the latter live and grow up in good health, except a very few dyspeptics, who are not free of complaints, which those also are liable to who live on fermented wheaten bread.

From these considerations, it will appear, that a great deal too much has been said of the noxious effects of unfermented farinacea. It will surprise modern physicians to find, that Celsus (who, like other ancients, can hardly be in the wrong) should say, that unfermented bread is more wholesome than fermented bread. I am ready to allow that he was in the wrong; but I am disposed to suspect, that it happened from his observing that the lower people, who lived on the unfermented, were generally more healthy than those of the better sort, who lived upon fermented bread." (k)

Since the preceding observations were drawn up, we have met with the following new theory of the fermentation which takes place in bread, by M. Duportal, professor of physic and chemistry in the academy of Montpellier, which we shall give in his own words:

"The making of bread is a domestic chemical operation, since in it those substances which are the most essential to the sustenance of man undergo a change in their nature. These substances are found united in the meal of the farinaceous seeds, especially in those of wheat, which furnishes the best bread. M. Chaptal has found this latter farina to consist of starch, gluten, mucilage, and sugar. We may add to them the ferment, the vegetable albumen, calcareous phosphate, &c. which must be reckoned in the number of materials

which compose it. What share has each of these principles in carrying on the pannary fermentation? It is generally believed, that the farina being reduced into a paste, the mucous saccharine principle undergoes the vinous fermentation; that the starch has a tendency to become acid; and that the gluten and albumen enter into putrefaction.

I cannot entirely accord with this doctrine. It appears to me to be more correct, to suppose that the ferment, after having converted the sugar of the farina into carbonic acid gas, and into alcohol, changes this into acetic acid; that at the same time the gluten and the albumen are in part decomposed, acetic acid is again produced, some ammonia, and more carbonic acid gas, &c.; and that, the starch uniting with the undecomposed gluten, there results a compound, the further alteration of which is prevented by the action of fire, which combines still more intimately these principles. This theory of the pannary fermentation seems to me to be supported by the following facts:

1st, Those farinæ which are deprived of the fermenting principle, or those which scarcely contain any of it, always afford heavy bread, although the muco-saccharine principle forms a part of them; for this substance not being a fermentable principle, it cannot ferment of itself, although it does so by means of a ferment. Thus, it is customary to add to the dough a leaven taken from bread already fermented, or the yeast of beer, as is the practice in Paris.

2d, Dough is always acid, notwithstanding that the volatile alkali formed in the operation neutralizes one part of the acetic acid, as is proved by the ammoniacal odour of dough treated by potass. Bread itself always

contains a little of this acid, which heightens the flavour of it.

3d, The starch, the undecomposed gluten, and the other materials of the dough, are so intimately united by the baking, that it is no longer possible to separate them. We can discover by the distillation of bread an animal matter, for it forms ammoniacal acetite; but a less quantity of this is obtained from it than of farina, according to the observation of M. Vauquelin.

4th, The formation of carbonic acid gas is rendered evident by the volume which the dough acquires, and by the numerous cavities which are seen in it. This gas escaping while the bread is baking, dilates the mass still more, which causes the air to lodge in those cavities: an important circumstance; whence results, say they, the remarkable whiteness of bread, full of little holes, so light, delicate, and sapid, in comparison with the bread destitute of them, which is heavy, compact, and of a disagreeable taste. It is, therefore more particularly the *ferment* which has the most active share in producing pannification. Added to dough in small quantity, the operation is slow and incomplete; in too large proportion, the fermentation goes on so rapidly, that it becomes necessary to check it. In this last case, M. Chaptal proposes to knead some carbonate of potass with the dough, which will neutralize the excess of acetic acid. Our good housewives content themselves with uncovering the dough, dividing it, and exposing it to the air, in order to diminish the temperature of the fermenting mass; and this management sometimes succeeds." See Chaptal's *Nouveau Cours Complet d'Agriculture*; and the *Annales de Chimie*, 1810. (*)

(*) As the word "Corn" is made use of in the foregoing article, it may be proper to remark that it is the general British term for grain of all kinds of which bread is made. The same term is exclusively applied in the United States, to the native indian corn, which grain in Europe is called maize, or mays, and in France Blé de Turquie, or maïs. The botanical name is *zea mais*.

In the United States we had formerly superfine, common, middling flour, and ship stuff: the three first corresponding to the English white, wheaten, and household flour. Ship stuff is the coarsest part of the flour.

But at present, and for some years past, such is the progress in the art of milling that little else is made except superfine flour, whereas formerly wheat of the first quality was required to make an article capable of bearing that stamp; and we are of consequence deprived of that wholesome species of family bread called *middlings*, and obliged to eat a bread, which although made from superfine flour, is not so sweet or pleasant to the taste. Bread is also made from rye flour, and is a great favourite with all classes of people. In the southern states bread from indian corn is in universal use, and when eaten fresh is justly praised for its agreeable taste; although it must be allowed that it is liable to the same objections that may be urged against fresh wheat bread. Corn meal is also made up in families with milk and yeast, by which the taste of the bread is improved; it is

also lighter than when made merely with corn meal and water. In South Carolina and Georgia, rice is also made into bread. See Repertory of Arts, vol. 9, for the process, by John Drayton Esq.; also Archives of Useful Knowledge, vol. 3d. p. 272. In the western parts of Pennsylvania, bread made of flour the produce of that species of wheat called speltz, is in general use, and preferred even to that from the common wheat flour. In the summer season household bread is often made of a mixture of indian corn meal and wheat flour, and is much esteemed in the United States.

In England, a sack of flour containing five bushels, and weighing 280lbs. avoirdupois, is made at an average, into 80 quartern loaves. Hence $3\frac{1}{2}$ lb. of flour go to every loaf. For this quantity of flour, 5lbs. avoirdupois of common salt, and about three English pints of good yeast, are allowed. There is reason to believe also, that about an ounce of alum, previously dissolved in water, is mixed with the yeast.* The dough being properly kneaded and fermented, is divided into masses, weighing each 4lb. 15 ounces avoirdupois, the quantity of wet dough allowed for the well known *quartern loaf*, which when baked must by law weigh 4lb. 5½ ounces avoirdupois; thus 11½ ounces are allowed for loss in baking. The quality of flour varying much, some will make more bread than others: this difference is found to amount to three loaves in a sack of flour.

* Edlin's Treatise on Bread-making, p. 90.

In France Mr Tillet found, by experiments made in 1783, that a loaf of dough weighing 4.625 pounds, weighed only 3.813 pounds when baked; or 0.812 pounds less than the paste. Consequently 100 parts of paste lose at an average 17.34 parts, or somewhat more than $\frac{1}{6}$ by baking. But this loss is by no means uniform, even in the same baking. This difference may probably depend upon the more or less perfect manipulation of the various loaves or masses of dough, upon their unequal fermentation; upon the forms of the loaves; (for the greater the surface the more evaporation;) and lastly, upon the position of the loaves in the oven: to explain the influence of the last cause it may be necessary to mention that the greatest quantity of steam from the bread condensed is towards the centre, and of course the loaves placed near it will be more moist, and weigh more than those loaves placed near the sides.

The proportion of bread obtained from a given quantity of flour varies according to the quantity of gluten* contained in it. In proportion too, to the gluten will be the quantity of water which a certain measure of flour will take up. The bakers, who know experimentally the profit derived from this circumstance, are in the constant practice of trying the quantity of flour by kneading a small quantity of it in their hand with water, and from the tenacity of it when drawn out judge of its quality. Experienced persons can often form an accurate judgment of the excellence of flour, that is, whether it will rise well with yeast and make good bread, from its external appearance; but these marks are not always infallible, as the writer has been informed by a respectable baker.

The bakers of Philadelphia allow that it is good flour when 14lb. of it will make 18lb. of bread; to this quantity however they add about three quarts of water, three half pints of yeast and half a pint of salt; but it often happens that 14lb. will not turn out 17lb. of bread. A correct judgment may be formed of the proportion of gluten contained in wheat by chewing some grains for a few minutes, when the mass will be found to be more or less tenacious in proportion to the quantity of that substance contained in it. No one who has not tried this experiment can imagine the difference in that respect that will be found in two parcels of wheat.

Of all the varieties of wheat upon which the experiment has been made by the writer, the red chaff bearded, and the white wheat, the seed of which came from Caroline county, Virginia, yielded the most. The Sicily wheat less than any other on which the experiment was made.

Those who are curious to see the whole art of the baker detailed, are referred to *Edlin's Treatise* on the art of bread-making.

Assize of bread, means the regulation of the price of bread by law. The first law in England for this purpose was passed in the 51 year of the reign of Henry III. and has been continued until the present time. In Pennsylvania, while a colony of Britain, the example of the mother country was followed, and so early as 12th of William III. an act for the assize of bread was passed, which prescribes that the calculation of the price of bread should be made from the market price of *wheat*, but it was found in process of time that this principle was extremely erroneous, inasmuch as the price of

wheat and that of flour were not always in proportion to each other. In the year 1772 therefore (March 21) the former law was repealed, and the assize was determined from the price of flour by the Cwt. and a fourpenny loaf was taken as the standard by which loaves of bread of any size were to be sold. Thus flour being 7s. per Cwt. the fourpenny loaf was to weigh 3lb. 5 $\frac{1}{2}$ oz. avoirdupois; if flour was 12s. the loaf was to weigh 2lb. 8oz. and when flour was 17s. 9d. the same loaf was to be reduced to 1lb. 14 $\frac{1}{2}$ oz. and so in proportion for loaves of a larger or smaller size. The law was at first only to continue in force for three years, but at the end of that time it was again revived (viz. in March 1775) and continued in force until the declaration of Independence, which of course abolished the powers of the former state and city governments. During the continuance of the illy regulated city police, all the war, and for several years afterwards, no regulations were adopted on the subject: but after the incorporation of Philadelphia, a law was passed by the legislature authorizing the mayor and aldermen to fix the assize; but doubts being expressed by some whose opinions were well worthy of consideration, as to the justice of the measure, or rather an opinion being expressed as to the unequal bearing of the law, it was not revived after the expiration of the time for which it had been passed. However in 1797, the legislature, sensible of the necessity of securing the citizens from imposition, enacted that bread should thereafter be sold by the pound avoirdupois, and bakers and venders of bread are required to keep scales and weights for weighing the same. This law is still in existence, but it is a dead letter, for no one pretends to buy bread by the pound; nor are scales and weights kept for weighing it by the bakers or dealers in the article. Loaves are commonly made of three sizes, and are sold for one fourth of a dollar, one eighth of a dollar, and one sixteenth of a dollar; and it is known that the weights of loaves sold for the same price by different bakers vary considerably.

Laws to regulate the price of labour, or of articles of the first necessity, ought to be laid with great caution: but while it is clear that a reasonable profit should be allowed to every man upon his labour, justice requires of every government to protect the body of its citizens and strangers from imposition, in the sale of any staple article by a particular set of men, or in the price they may charge for particular species of labour or personal services. Hence most governments have established inspections for the several domestic articles usually exported, and some have wisely regulated the prices for coach hire and portage. By the first, the honour of the nation is saved from the disgrace that would attach to it in foreign countries, by the permission to its citizens to export damaged articles, or to practice deception in them; but it also actually raised in foreign markets by the stimulus given to the spirited and honest manufacturer, mechanic, or dealer, to prepare the articles in which he deals in the best manner, so as to obtain the mark of the highest approbation. The increased demand too, for the articles of home produce, which such strict discipline necessarily creates, eventually leads to the increase of national and individual wealth, and promotes morality.

In the case of labour, when one citizen is employed by another, it is equally to the credit of the nation, and

* Gluten.—If wheat flour be kneaded with water into a paste, and water be poured on the mass, whilst the kneading is continued, until the water cease to carry off any more of it, what remains is called *Gluten*. See that article.

required by a sense of justice, that one portion of society should not impose or extort upon another. In many cases, the circumstances of the case regulate and prevent the evil complained of; and hence when a mechanic charges extravagantly, or greatly slights his work, a ready relief is obtained by employing another; but this resource can only be had when individuals of the calling complained of abound in society: but it is denied in the case of the baker, for he deals in an article of the first necessity, and it is easy for the trade to enter into a combination to force a compliance with their prices, which those of other callings cannot accomplish, at least to the same injurious extent.

In several, if not all, of the cities in the United States, the assize of bread is regularly established; but the principles or data by which they are regulated, are unknown to me, except in the instance of New-York, where it appears to be taken for granted, that a barrel of flour of 196 pounds will gain 56 pounds when made into bread: the barrel will therefore turn out 252 pounds of bread; this number multiplied by 16, (the number of avoirdupois ounces in a pound,) will produce 4032 ounces, and the corporation have agreed that 3 dollars 50 cents, or 28 shillings (New York currency) is a reasonable profit for making up a barrel of flour.

In order to determine the weight of a shilling loaf of bread of various qualities, the chamberlain is required to divide the number of ounces as above, by a number equal to the number of shillings a barrel of flour may be worth at the time, and to add the legal profit thereto; the quotient will be the number of ounces which a shilling loaf must weigh. When the fractional parts are less than half an ounce, they are taken off the loaf; and when half an ounce or more, an ounce is added to it.

The following example will illustrate this rule:

Price of a barrel of flour—suppose	L 2 : 16
Legal profit	1 : 8
84)4032(48	4 : 4
336	20
672	84s.
672	

Thus when flour sells at seven dollars a barrel, the shilling loaf must weigh 48 ounces, or 3 pounds avoirdupois.

The chief principle upon which the foregoing rule for regulating the assize is grounded, is the supposition that a barrel of flour will invariably produce a certain number of pounds of bread; but this, as has already been seen, is not the case: the variation however will not be so likely to operate as great a source of loss to the bakers, as the citizens at large would suffer if no such regulation existed. But a source of contention may arise from the time at which the loaf is weighed after it comes from the oven, for a loaf loses every hour after it is baked, until it is 24 hours old: and hence it may be of the legal weight shortly after it is baked, and yet be below the standard the next day.

In England there are three sizes of loaves, viz. the peck loaf of 17 pounds 6 ounces, avoirdupois weight; a half peck loaf of 8 pounds 11 ounces; a *quartern loaf* of 4 pounds 5½ ounces; and it is enacted, that all these loaves shall be sold, as to price, in proportion to each other respectively. So far the regulation is good, but when they resolve to determine the price at which those loaves are to be sold, and to fix the quantum of profit which the baker shall receive for his labour, it is a question whether great injustice is not done to a set of men who are essential to the comforts of the citizens. The price of wheat, and of course of flour, varies as much as that of beef, or pork, and in England much oftener; why then should a corporation deem itself more authorised to regulate the profits of a baker than a butcher? As already observed, it is the duty of all governments, state; or municipal, to secure the citizens at large from imposition, and it is conceived that this may be easily effected in the case of the state of bread, by combining part of the British regulation with that of Pennsylvania: viz. by specifying the weights of various loaves, and selling the same by weight. The consequence will be, that the citizen will naturally deal with that baker who gives the greatest quantity of good bread for the least money, and the price will of course be always regulated by that of flour, which is a matter of public notoriety, and might be regularly published by authority once a week, for general information. MEASE.

BREAD FRUIT (*Artocarpus incisa*). This fruit is the produce of a species of the genus *Artocarpus*, which grows abundantly in the South Sea islands. There are several species, which are noticed in the article BOTANY, and to which we refer, as our present object is limited.

The characters of the bread-fruit tree are the following:

Class, MONOCIA.
Order, Monandria.

Catkin cylindrical—gradually enlarging—covered with flowers.

Male. Calyx two-valved. No corolla.

Female. No calyx. No corolla. One style.

Drupe. Multilocular.

Thunberg mentions several subspecies of the *artocarpus incisa*; but the information which he has afforded is crude and imperfect. The natives of the Society Islands, according to the narrative with which Admiral Bligh has favoured the public, reckon eight species; though the correctness of their division does not appear quite evident. The species and names are as follow:

1. Patteah.
2. Eroroo.
3. Awanna.
4. Mire.
5. Orec.
6. Powerro.
7. Appeere.
8. Rowdeeah.

The differences are said to consist chiefly in the

leaves, and are very trifling. The eighth species has a large broad leaf, without any notches; while those of all the other species are more or less notched. It may be a variety; but we are not aware of any sufficiently accurate observations which might enable us to decide this point.

The fruit of the Patteah differs from that of the Row-deeah; the former is oblong, while the latter is round, and not above half of the size of the other.

All the species of the *Artocarpus* are natives of the South Sea islands, and have long attracted the notice of voyagers. So long ago as in 1688, when Dampier performed his voyage round the world, the species which we have described was noticed, and the following description given of it:

"The bread-fruit (as we call it) grows on a large tree, as big and high as our largest apple trees; it hath a spreading head, full of branches, and dark leaves. The fruit grows on the boughs like apples: it is as big as a penny loaf when wheat is at five shillings the bushel; it is of a round shape, and hath a thick tough rind. When the fruit is ripe, it is yellow and soft, and the taste is sweet and pleasant. The natives of Guam use it for bread. They gather it when full grown, while it is green and hard; then they bake it in an oven, which scorcheth the rind and maketh it black; but they scrape off the outside black crust, and there remains a tender thin crust; and the inside is soft, tender, and white, like the crumb of a penny loaf. There is *neither seed nor stone* in the inside, but all of a pure substance, like bread. It must be eaten new; for, if it be kept above twenty-four hours it grows harsh and choaky; but it is very pleasant before it is too stale. This fruit lasts in season *eight months* in the year, during which the natives eat no other sort of bread kind. I did never see of this fruit any where but here. The natives told us, that there is plenty of this fruit growing on the rest of the Ladrone Islands; and I did never hear of it any where else."

The most satisfactory accounts which we have met with, both of the tree and of the fruit, are those given by Hawkesworth, in his account of the first voyage of Captain Cook, and that of our illustrious Circumnavigator himself, in his account of his last voyage. We shall therefore extract both, for the satisfaction of our readers.

"The bread fruit grows on a tree that is about the size of a middling oak. Its leaves are frequently a foot and a half long, of an oblong shape, deeply sinuated like those of the fig tree, which they resemble in consistence and colour, and in the exuding of a white milky juice upon being broken. The fruit is about the size and shape of a child's head, and the surface is reticulated not much unlike a truffle. It is covered with a thin skin, and has a core about as big as the handle of a small knife. The eatable part lies between the skin and the core. It is as white as snow, and somewhat of the consistence of new bread. It must be roasted before it is eaten, being first divided into three or four parts. Its taste is insipid, with a slight sweetness somewhat resembling that of the crumb of wheaten bread, mixed with a Jerusalem artichoke." Dr Hawkesworth, in another part, gives a very flattering picture of the advantages resulting from the bread fruit tree, which, as will appear, is rather fanciful than correct. He says, "Of the many vegetables that have been mentioned already, as serving them (the natives of the Society Is-

lands) for food, the principal is the bread fruit, to procure which, costs them no trouble or labour but to climb a tree. The tree which produces it, does not indeed shoot up spontaneously; but, if a man plants ten of them in his lifetime, which he may do in about an hour, he will as completely fulfil his duty to his own and future generations, as the natives of our less temperate climate can do by ploughing in the cold winter, and reaping in the summer's heat, as often as these seasons return. Even if, after he has procured bread for his present household, he should convert the surplus into money, and lay it up for his children.

"It is true, indeed, that the bread fruit is not always in season; but cocoa nuts, bananas, plantains, and a great variety of other fruits, supply the deficiency."

Of a tree, respecting which so much has been said, it is very interesting to know every circumstance connected with the cultivation; and captain Cook, whose enterprising mind lost nothing worthy of record, made some valuable observations, which will be most satisfactorily exhibited in his own words. "I have enquired very carefully," says captain Cook, "into their manner of cultivating the bread fruit tree at Otaheite; but was always answered, that they never planted it. This, indeed, must be evident to every one who will examine the places where the young trees come up. It will be always observed, that they spring from the roots of the old ones, which run along near the surface of the ground; so that the bread fruit trees may be reckoned those that would naturally cover the plains, even supposing that the island was not inhabited, in the same manner that the white barked trees found at Van Diemen's Land, constitute the forests there. And from this we may observe, that the inhabitant of Otaheite, instead of being obliged to plant his bread, will rather be under the necessity of preventing its progress, which I suppose is sometimes done, to give room for trees of another sort, to afford him some variety in his food."

Captain King, in his valuable work, notes a singular fact, that the bread fruit tree does not thrive, in point of number, so well in the Sandwich islands as in the plains of Otaheite, but that they produce double the quantity of fruit. The trees, too, in the former, are of the same size with those in the latter; but differ in having their branches striking out much lower.

Admiral Bligh remarked, that the inhabitants of Otaheite take up the young shoots from the parent root with best success after wet weather, when the earth forms balls around the roots. The plants so removed, are not then liable to suffer.

It will not be uninteresting to give some account of the attempts made by Europeans to cultivate the bread fruit tree for economical purposes. As far as we know, the attempts have originated in this country, and have been made by Englishmen. An interesting narrative of the voyage, made for the purpose of conveying plants of this fruit, as well as of other fruit trees, to the West India colonies, has been long given to the public, by the gentleman who commanded both of the expeditions that have been sent out to the South Seas. We shall give a correct outline of that narrative, as well as an abstract of Admiral Bligh's MS. narrative of his last voyage, with which he has, with the utmost politeness and kindness, furnished us.

In consequence of the urgent applications of many West Indian merchants and proprietors, his Majesty de-

terminated on sending out an expedition to the South Sea islands, from which plants of the bread fruit tree were to be conveyed to our West Indian settlements. This was the first voyage undertaken to that part of the world with a view to advantage,—those that had preceded it, having been directed rather to discovery, than to immediate benefit.

A ship named the *Bounty*, was fitted up for the voyage, and, on the 16th of August 1787, Lieutenant (now Admiral) Bligh, who had accompanied Captain Cook in his last voyage, was appointed to command her. The character of this officer is now so well known, by his daring zeal in the public service, that it becomes scarcely necessary to remark on the extreme propriety of the selection which was made. The crew consisted of forty-four, officers, petty officers, and seamen; besides, "two skilful and careful men were appointed, at Sir Joseph Banks' recommendation, to have the management of the plants intended to be brought home: the one, David Nelson, who had been on similar employment in Captain Cook's last voyage; the other, William Brown, as an assistant to him." The whole number of men on board of the *Bounty* amounted to forty-six. "The burthen of the *Bounty* was nearly 215 tons; her extreme length on deck ninety feet ten inches; extreme breadth twenty four feet three inches; and height in the hold, under the beams at the main hatchway, ten feet three inches. In the cock pit, were the cabins of the surgeon, gunner, botanist, and clerk, with a steward's room, and store-rooms. The between decks was divided in the following manner: The great cabin was appropriated for the preservation of the plants, and extended as far forward as the after hatchway. It had two large skylights, and on each side three scuttles for air, and was fitted with a false floor, cut full of holes, to contain the garden pots in which the plants were to be brought home. The deck was covered with lead, and, at the foremost corners of the cabin, were fixed pipes, to carry off the water that was drained from the plants, into tubs placed below, to save it for future use." Being thus completely fitted up for carrying the design of the expedition into complete effect, Lieutenant Bligh, after having been baffled by contrary winds for nearly a month, at length sailed on his memorable voyage on the 23d of December, 1787. The instructions from the admiralty were full and satisfactory, and detailed with care, all the objects to which the voyagers were especially to direct their attention.

By these instructions, Mr Bligh was particularly enjoined to proceed to the Society Islands, "where, according to the accounts given by the late Captain Cook, and persons who accompanied him during his voyages, the bread fruit tree is to be found in its most luxuriant state."

Lieutenant Bligh directed his course to the island of Teneriffe, whence he sailed for Cape Horn; off this he encountered such boisterous weather, that he bore away for the Cape of Good Hope. From the Cape he proceeded to Van Diemen's Land, and last of all to the island of Otaheite, where he arrived on the 25th of October, 1788.

The *Bounty* remained at Otaheite until the 3d of April 1789, at which place the number of bread fruit plants was completed. The number amounted to 1015, and they were contained in 774 pots, 39 tubs, and 24 boxes. Lieut. Bligh sailed from Otaheite on the 4th of

April, and having passed through the Society Islands, and visited some of the Friendly Islands, the voyage promised every success, until the 28th of March 1789, when a conspiracy, which had been planned with infinite caution, was carried into effect, and the whole of Lieut. Bligh's exertions were blasted for a season.

"Until the day of the mutiny," says that gentleman in his narrative, "the voyage had advanced in a course of uninterrupted prosperity, and had been attended with many circumstances equally pleasing and satisfactory. A very different scene was now to be experienced. A conspiracy had been formed, which was to render all our past labour productive only of extreme misery and distress. The means had been concerted and prepared with so much secrecy and circumspection, that no one circumstance appeared to occasion the smallest suspicion of the impending calamity."

Early on the morning of the 28th of April 1789, Lieutenant Bligh was seized, when asleep in his cabin, by a party of armed mutineers, and forced on deck in his shirt, with his hands tied with a cord behind his back. On arriving upon deck, he found that such of the officers (the master, the gunner, the surgeon, one of the master's mates, and Nelson the botanist) as had maintained their allegiance, were confined in the fore hatchway, and were guarded by centinels. The launch was hoisted, and the designs of the mutineers were then evident. Particular individuals were ordered into the boat; and those that hesitated were forced to comply. Their commander was compelled to accompany them. Eighteen of Lieutenant Bligh's crew remained faithful to their duty. Among these, particular praise is due to Mr Samuel, (the clerk of the commander,) for his very meritorious exertions in securing Mr Bligh's journals, commission, and some valuable ship-papers. His attempts to carry off the time-keeper, with a box containing the lieutenant's surveys, drawings, and remarks, for fifteen years, were frustrated. Four of the crew were detained by the mutineers, in opposition to their own wishes.

Mr Bligh and his unfortunate party, with 150lbs. of bread, a small quantity of wine and rum, a few pieces of pork, a quadrant and compass, with a few other materials necessary for navigation, were cast adrift on the open ocean, by the unfeeling mutineers. The ring-leader of this mutiny appears to have been a Mr Christian, the master's mate; and his associates were two midshipmen, some petty officers, and about fourteen seamen, making all together twenty-five men. It may be difficult to develop the motives of their extraordinary conduct; and as the transaction has for a long time been nearly forgotten, it is not necessary to wound the feelings of those who may have the misfortune to be connected with men capable of forgetting their duty to their king and country so completely as Mr Christian and his associates appear to have done.

After having encountered no less danger from the elements than from the treachery of the savage inhabitants of the island of Tofoa, one of the Friendly Islands, this band of determined heroes reached New Holland, where they refreshed themselves by rest, and obtained some supplies of food. From New Holland they proceeded across the ocean, and on the 14th of June 1789, after having encountered famine, and exposure to the inclemency of the elements, they arrived at the Dutch settlement of Coupang, in the island of Timor, after having traversed the open ocean for more than 1200

leagues, in an open boat, without the loss of a single individual by disease. The reception which those unfortunate people met with from the Dutch government, was gratifying in the last degree; and the benevolent attention shown them, enabled twelve to return to their native land. Lieutenant Bligh arrived in England on the 14th of March 1790. During this most perilous voyage many valuable observations were made, and have been recorded by Admiral Bligh in his narrative. They are worthy of attention; but, as they are not connected with the subject of this article, we must refer to the original work itself.

Thus, for a time, the benevolent wishes of the king were disappointed, by those, whose most anxious desire should have been to promote such praise-worthy efforts by every means in their power.

But although the infamous mutiny of Mr Bligh's crew had entirely frustrated the designs of his majesty in sending out the *Bounty*, yet it did not lessen the zeal for benefiting his people, which had first suggested the plan; and accordingly we find, that, as soon as circumstances permitted, a new expedition was set on foot under the auspices of the same commander, whose own account, furnished with the utmost liberality from his MS. journal, we beg leave to lay before our readers: it will convey clearer ideas of the voyage than can be afforded by any other means.

"Captain Bligh sailed from England in command of his majesty's ship *Providence*, with a small vessel to attend him, called the *Assistant*, on the 3d of August 1791, to proceed to Otaheite in the South Sea, and from thence to bring the bread-fruit plant to the West Indies, and such others as might be found of rarity or use. On his return, it was left for him to explore the passage between New Holland and New Guinea; a passage which no mariner had dared to attempt before the Captain's voyage in the *Bounty*, which has been already narrated. All this was accomplished.

On the 28th August 1791, Captain Bligh anchored, with his tender, in St Cruz road at the island of Teneriffe, and having taken in wine and refreshments, he sailed from thence on the 1st September; after having touched at the island of St Jago, he proceeded to the Cape of Good Hope, and anchored in Table Bay on the 6th November.

The vessels remained at the Cape until the 23d December 1791, when they sailed for Van Diemen's Land, which they reached on the 9th February 1792. Having sailed on the 24th of the same month, they arrived on the 9th of April in Matavai Bay in the island of Otaheite.

At this place they remained, and the crews were zealously employed in collecting the bread-fruit plants, which were stowed in the great cabin of the *Providence*, which had been previously prepared for their reception. All were got on board by the 17th July, and they sailed the following day, with 1281 pots and tubs of plants, in the finest condition.

After a most dangerous passage through the straits which separate New Holland from New Guinea, Captain Bligh anchored at Coupang in the island of Timor, on the 2d October, where he remained, replacing such plants as had died with others of that island, until the 10th of the same month, when he sailed by the Cape of Good Hope, which he passed, without having the thermometer lower than 61° Fahrenheit, or going farther south than 37° 46' south latitude.

On the 17th December, he anchored at St Helena; there 57 kinds of fruit trees were collected, and that the settlement might be benefited by those he had on board, Captain Bligh gave to the government 23 bread fruit plants, besides some other valuable fruit trees.

Captain Bligh now proceeded to the island of St Vincent, and arrived in Kingston Bay on the 23d January 1793; there he remained until the 23d instant, when, having left under the care of Dr Anderson, the well-known superintendant of the botanical garden in that colony, 333 bread fruit trees, and 211 fruit trees, and having received 467 plants for his majesty's garden at Kew, he sailed for Jamaica, in termination of his orders.

Having executed the duty entrusted to him with the utmost celerity, Captain Bligh arrived at Port Royal, in the island of Jamaica, on the 5th February 1793. There he landed 623 plants, 347 of which were bread fruit. The others consisted of the finest fruit of the East.

To complete all the objects of Captain Bligh's mission, it only remained for him to return to Britain with a selection of plants for the king; and accordingly he accomplished that end, with a great variety of beautiful specimens.

The two vessels sailed from Jamaica on the 14th June 1793, and having left some plants on the Grand Cayman, they arrived in the Downs on the 2d August 1793."

The *Providence* was 420 tons burthen. The *Assistant* 110. The former carried 100 men, the latter 27. The *Assistant* was commanded by lieutenant Nathaniel Portlock.

From Jamaica and St Vincent's, plants of the bread fruit tree have been introduced into different parts of the British colonies, chiefly by the exertions of public spirited individuals; so that the culture of it has received a very fair trial. It has been said that Dr Anderson of St Vincent has succeeded in raising trees both from cuttings and layers. We know not whether this be the fact or not; but of this we are perfectly assured, that the experiment has been completely unsuccessful in the hands of some intelligent gentlemen, who have made it with much attention, and on whose accuracy we can rely. Fortunately, however, it has been sufficiently ascertained, that there is a simple mode of propagation which very generally answers. It is merely this: One of the branches of the root is pared of earth, and then wounded with a spade; in a short time, a shoot springs up from the wound; after this has occurred, and the shoot is sufficiently vigorous to bear removal, the separation is completed; and any accidental connection with fibres, or other useless appendages, is also destroyed. The young plant is then dug up, with a proper quantity of earth, and placed in a hole, in which it soon fixes itself. In about three years it expands into a full sized tree, which yields fruit in great abundance.

It will naturally be asked, after the vast exertions made by the meritorious and persevering individual, who commanded both expeditions to the South Sea islands, in quest of the bread fruit tree, after the expense incurred, and the benevolent zeal displayed by the sovereign for the welfare of his West Indian subjects, and after the high expectations that were at one time excited by the splendid narratives of voyagers, how far the bread fruit tree has succeeded in point of cultivation,

as well as in point of utility, as an article of food, on which a large proportion of the West India population could depend? The answer to such inquiries will be unsatisfactory, and such as little accord with the very flattering hopes which were at one period expected to be realized. In those colonies where the plantain tree (*Musa paradisiaca*;) grows readily, the bread fruit tree cannot be introduced with advantage, owing to the greater difficulty of cultivation in the one case than in the other, and to the very decided preference which the negroes give to the plantain. The bread fruit tree, as we have already seen, requires some years to bring it to maturity, the mode of propagation is tedious, and negroes have no great predilection for the fruit. This may arise from want of habit, (which might indeed be overcome,) and from its not furnishing food so palatable as that to which they have been accustomed. The plantain tree, on the contrary, is propagated with wonderful facility, and yields fruit in about fifteen months. Whenever an old plantain walk, (the name given in the colonies to the place allotted to the cultivation of this vegetable,) is to be cleared, which very commonly occurs, the roots are to be had for the mere labour of removal: One root sends up many shoots in regular succession, and this it continues to do for many years. After the first planting of these, the cultivator has no further trouble than to cut down the shoots on which the fruit is fit for use, and these are in their turn regularly replaced by others. Wherever then, a sufficient number have been planted, and due attention paid, in the first instance, to every requisite circumstance, there will always be a regular succession of fruit for many years. Besides these advantages, the fruit of the plantain tree is the favourite vegetable food of the black population; and it is capable of being dressed in various ways, whether it be pulled in its green or in its ripe state. These circumstances, however, can have only a local influence, as there are situations in which the plantain tree either does not thrive well, or fails altogether. In these, the bread fruit tree is likely to become a very valuable substitute; but whether or not the experiment has been fairly made, we do not know. We are inclined to suspect, that it never has been made on a great scale. There seems to be a melancholy want of experimental activity in the colonies, even on those matters that very deeply concern their interests. Individuals, it is true, have had sufficient foresight, and intellectual vigour, to make attempts at improvement; but as their efforts have been in general unsupported, it is not to be wondered that the results should be limited. This very probably originates in such a complication of causes, that it might be difficult to develop the share which each possesses in their common effect. Whatever they may be, it is of importance to the colonies, that they should be counteracted by powerful and efficient means; and these can only be called into play, by the intelligent and liberal-minded part of the West India community, whose means of observation may be immediately directed to these causes, which being once traced may be obviated. At the same time, those who exert them, may not only render important services to the colonial interest at large, but even benefit themselves as individuals in an eminent degree. Perhaps the establishment of societies, for promoting colonial agriculture, on a plan similar to the various agricultural societies in this country, (whose beneficial influence has been so decidedly experienced in those

VOL. IV. PART II.

parts where they have been established,) might conduce to this great end.

London might be a central point, at which a chief society, composed of the colonial proprietors resident in Britain, might hold its meetings. Branches of this great society might be formed in each of the colonies. Premiums should be awarded to those who have carried any new scheme, that promises to be of utility, into effect; and a regular correspondence kept open between the London society and its branches. By such means, and such only, can the whole of the resources of the colonies be called forth; and if once a spirit of improvement and of emulation should arise, the public benefit would be incalculable. And among other advantages, the bread fruit tree would have all the advantages of a full and extended trial.

Even in those colonies into which the bread fruit has not been generally introduced as an article of food, it is used as a delicacy; and whether employed as bread, or in the form of pudding, it is considered highly palatable by the European inhabitants.

When used instead of bread, it is roasted either whole, or cut into three or four pieces.

"Bread fruit is also cooked in an oven, which renders it soft, and something like a boiled potatoe; not quite so farinaceous as a good one, but more so than those of the middling sort."

"Of the bread fruit, the Otaheiteans also make three dishes, by putting either water, or the milk of the cocoa put to it, then beating it to a paste with a stone pestle, and afterwards mixing it with ripe plantains, bananas, or the sour paste which they call *mahie*."

"The *mahie*, which has been mentioned as a succedaneum for ripe bread fruit, before the season for gathering a fresh crop comes on, is thus made."

"The fruit is gathered just before it is perfectly ripe, and being laid in heaps, is closely covered with leaves; in this state, it undergoes a fermentation, and becomes disagreeably sweet. The core (says Dr Hawkesworth) is then taken out entire, which is done by gently pulling the stalk, and the rest of the fruit is thrown into a hole which is dug for that purpose, generally in the houses, and neatly lined in the bottom and sides with grass; the whole is then covered with leaves, and heavy stones laid upon them: in this state, it undergoes a second fermentation, and becomes sour, after which it will suffer no change for many months; it is taken out of the hole as it is wanted for use, and being made into balls, it is wrapped up in leaves and baked. After it is dressed, it will keep five or six weeks. It is eaten both cold and hot, and the natives seldom make a meal without it; though, to us, the taste was as disagreeable as that of a pickled olive generally is the first time it is eaten."

"As the making of this *mahie* depends, like brewing, upon fermentation; so, like brewing, it sometimes fails, without their being able to ascertain the cause. It is very natural, therefore, that the making it should be connected with superstitious notions and ceremonies. It generally falls to the lot of old women, who will suffer no creature to furnish any thing belonging to it, but those whom they employ as assistants, nor even to go into that part of the house where the operation is carrying on." See Dampier's *Voyage round the World. Account of Captain Cook's Voyage round the World during the years 1767, 1768, and 1769*, by John Hawkesworth, LL.D. *Account of Captain Cook's last Voyage*,

performed in the years 1776, 1777, 1778, and 1779. *The Narrative of the latter part of the same Voyage, performed during 1780, by Captain King.* "A Voyage to the South Sea, undertaken by command of his Majesty, for the purpose of conveying the Bread Fruit Tree to the West Indies, in his Majesty's ship the Bounty, commanded by Lieutenant William Bligh, including an Account of the Mutiny on board the said Ship; and the subsequent Voyage of part of the Crew in the Ship's Boat from Tofoa, one of the Friendly Islands, to Timor, a Dutch Settlement in the East Indies. (C. M.)

BREASTWORK. See FORTIFICATION, and GUN-NERY.

BREBERS, or BEREHBERS. See BARBARY, p. 250.

BRECHIN, one of the royal boroughs of Scotland, in Angus-shire, is delightfully situated on the side of a hill which rises from the north bank of the river Southesk, over which is a good stone bridge adjoining to the town. It lies eight miles west from Montrose harbour, from whence the tide flows within two miles of the bridge.

It was a bishop's see, founded about the year 1150 by David I., surnamed the *Saint*, on account of his extraordinary liberality to the church. Its annual revenue, paid in money and in kind before the Reformation, is said to have amounted to seven hundred pounds; but, after that event, it was diminished to one hundred and fifty pounds, owing to the alienation of its estates by Alexander Campbell, the first Protestant bishop, to his chieftain the Earl of Argyle, by whose interest he had been promoted to that see. Keith, in his description of the religious houses in Scotland, says, "In this bishopric there is great confusion and uncertainty." At the Reformation, an account of the rents and revenues of all ecclesiastical benefices was required to be given in to the privy council of Scotland; and the return sent from the see of Brechin was as follows: "Four hundred and twenty-four pounds seventeen shillings Scotch; one hundred and thirty-eight capons; two hundred and eight fowls; eighteen geese; three barrels of salmon; eleven bolls wheat; fourteen chalders and six bolls bear; twenty-five chalders and five bolls meal; and one chalders and two bolls oats."

The Culdees had a convent here, who afterwards gave way to the Mathurines, or Red Friars. The ruins of the abbey, or convent of red friars, called the college, is still to be seen in the college, or canonry wynd, adjoining to the grammar-school; from which it would appear to have been a large building. Here was also one of those hospitals, which, in the time of Popery, were to be met with in various parts of Scotland; founded for the maintenance of the poor, or the education of youth; and, as being of peculiar benefit to the community, distinguished by the honourable name of *Maisons de Dieu*, or houses of God. It was founded about the year 1256, by William of Brechin, and the south wall is still entire in the upper part of the town.

It is not known by whom the cathedral was built. It is a Gothic pile supported by twelve pillars. The whole length, including the chancel which is demolished, was one hundred and sixty-six feet, and the breadth sixty-one feet. The west end of one of the aisles is entire; the door is Gothic, and the arch consists of many mouldings; it has also a window of curious and beautiful workmanship. A niche in the wall, on which stood a statue of the Virgin Mary, still remains. That part of the cathedral, which escaped the devastation of the reformers, is used

as the parish church, and was some years ago fitted up into an elegant and commodious house for public worship. The steeple of the church is a beautiful square tower, one hundred and twenty feet high, with battlements on the top, from which rises a handsome hexagonal spire.

Adjoining to the church stands a round tower, of uncommon elegance, known by the name of *the little steeple*, which is an object of attention and admiration to all strangers. It consists of sixty regular courses of hewn free-stone, laid circularly, and tapering towards the top, which is covered with a spiral roof. In the tower are four windows, facing the four cardinal points; and in the spiral roof are other four windows, placed alternate on the sides, and resting on the top of the tower. The inside is hollow, but has no stair; two good bells are hung in it, which are reached by means of ladders, placed on wooden semicircular floors, each resting on circular abutments within the tower. The inner diameter at the bottom is eight feet; the thickness of the wall, at the same place, is three feet seven inches; height to the roof eighty feet; the octagonal spire twenty-three feet; making the whole height, from the ground to the top of the building, one hundred and three feet. The only other tower similar to this in Scotland, is at Abernethy in Perthshire, (see ABERNETHY,) but its height is only three-fourths of the one now described. Conical towers, of the same description, are frequently to be met with in Ireland; but their date, and the use for which they were constructed, remain very doubtful, notwithstanding all the researches and investigations of antiquaries. By some they have been deemed *watch towers*, for the purpose of descrying invaders, and communicating by signals their approach. Others suppose that they had been designed for *belfries*, and introduced by some of the crusaders, in imitation of the minarets of mosques, from whence the criers summoned the people to prayers. A third opinion is, that they were *penitentiary towers*, used for the confinement of penitents, until they were restored to the bosom of the church; and that the Irish, (whose country obtained the name of the land of sanctity, *patria sanctorum*, on account of the number of its religious houses,) might have been the original inventors, and have introduced them into Scotland.

On the south side of the town stood the castle of Brechin, but no vestige of it remains. It was besieged by the English under Edward I. in 1303, and was gallantly defended by its governor, Thomas Maule, for twenty days, till he was slain by a stone from an engine, when it instantly surrendered. Near the scite, a castle of a modern construction was built by James Earl of Panmure in 1711, which commands a delightful view of the river Southesk, and the adjoining country; the river washing the foot of the rock on which the castle stands.

In the year 1647, the plague raged with great violence in this town, and carried off six hundred of the inhabitants in the short period of four months! Their bodies were deposited in the ground adjoining to the church, and a monument was erected with the following inscription, in memory of that awful visitation of heaven.

1647.

*Luna, quater crescens,
Se centos fecte steremptos
(Disce mori!) vidit.
Pulvis et umbra sumus.*

This town has several well-attended markets, or fairs,

particularly *Trinity fair*, which is held about a mile from the town, and is acknowledged to be the best fair for sheep, cattle, and horses, in the north of Scotland.

The Osnaburgh or brown linen manufacture is here carried on to a considerable extent; and, of late years, a good deal has been done in the manufacture of sail-cloth. There are, in the town, three mills for spinning flax; the machinery driven by water; and they give employment to 200 people, of both sexes, and of all ages. Another mill, of the same description, is in the country parish, which employs betwixt 80 and 90. In one of these mills, four looms, for the weaving of linen, have been lately erected, of a new construction, which are driven by water, and have hitherto fully answered the expectation of the proprietor. The following facts may, in some measure, ascertain the extent of those manufactures. The average number of yards of linen stamped in Brechin annually, from November 1800 to November 1810, is 730,000; the average number of yards of sail-cloth manufactured annually, from November 1805 to November 1810, is 155,000; besides betwixt 2000 and 3000 yards of canvas.

Several years ago a beer and porter brewery was erected upon a pretty large scale, at which there were brewed last year (1810) between 5000 and 6000 barrels of porter. It gives employment to 20 persons; but as it is now fitted up for brewing 20,000 barrels annually, more hands will of course be needed for preparing that quantity for the market. The porter is sent to London, and to various parts of Great Britain. In consequence of the war, the proprietors have been prevented from executing their original design of exporting to the continent: at present, however, a considerable quantity is exported to the West Indies. This brewery pays betwixt 700*l.* and 800*l.* of duty on beer and porter every six weeks, and about 70*l.* weekly of duty on malt; so that it yields an annual revenue to government of about 9,700*l.* It has been remarked, that since its commencement, the demand for spirits among the lower classes of people has greatly decreased, and their morals, of consequence, have been evidently improved. The population of the town is nearly 5000. N. Lat. 56° 40', E. Long. 2° 18'. See Pennant's *Tour through Scotland*, vol. ii.; Grose's *Antiquities*, vol. ii.; *Statist. Hist.* vol. xxi. (A. F.)

BRECKNOCK, or **BRECON**, called by the Welsh *Aber Hondey*, is the principal and county town of Brecknockshire, in South Wales, romantically situated at the confluence of the rivers Hondey and Uske. Its aspect, at a distance, excites no expectations, which the narrowness, irregularity, and dirtiness of its streets, and the general meanness of the houses, can much disappoint. Yet the mixture which it exhibits of modern buildings, dismantled towers, and religious ruins, renders its internal appearance sufficiently interesting. Formerly it was surrounded with a strong wall, in which were four gates. At present it consists of three principal streets, in which scarcely one handsome house occurs. If therefore Mr Malkin's statement be correct, that Brecknock is one of the "best built towns in Wales," we must form but a sorry opinion of the other towns in this principality. The objects most interesting to a stranger in Brecknock are the ruins of a castle and monastery, founded in the reign of Henry I., by Bernard de Newmark, a Norman lord. Of the castle, which seems to have been a grand pile of building, only a few detached fragments

remain, and these fragments are degraded and disfigured by a number of ugly cottages, erected in the midst of them. A tennis court has been formed in one angle of the fortress, and an undershot watermill, probably an original appendage, adjoins its scite. One tower of this castle still remains. It is called Ely tower, from Dr Morton, bishop of Ely, who was confined in it by order of Richard III.; and who concerted here, in conjunction with Stafford, Duke of Buckingham, the scheme of uniting the two houses of York and Lancaster, in consequence of which the tyrant was bereft of his kingdom and his life, and Henry VII. was elevated to the throne. "On the banks of the Uske," says an anonymous traveller, "amidst the solemn gloom of trees, may be traced the venerable and extensive ruins of a Benedictine priory; and on the east of the town stands the college, once a Dominican priory, now a collegiate church, with a dean and other dignitaries." Of this establishment the unfortunate Dr Dodd was a prebend. In his beautiful lines entitled "Pious Memory," he has described a custom which prevails in this vicinity, of decking the recent graves with flowers. The priory walk, on the shadow declivity of a hill, the foot of which is laved by the Hondey, is extremely pleasant. To the east of the town is a lake well stored with fish.

The coins occasionally found at Brecknock, and the evident traces of Roman entrenchments and fortifications, afford undoubted proof, that this was once occupied as a station, by the conquerors of the world. Of these antiquities, the most remarkable is a fortification, named Y-GAER, about two miles N. W. from the town. It is situated on a gentle eminence, overlooking the Uske; part of its walls remain; and within the area of the camp, some Roman bricks have been found similar to those at Caerlon, with the inscription LEG II AUG. Contiguous to the camp, in the middle of a highway, is a rude carved pillar, called, in the language of the country, the Virgin's Stone. Another monument of Roman antiquity, mentioned by Gough, is a sepulchral pillar, standing erect on the roadside, with an inscription, of which only the word VICTORINI is now legible.

Brecknock has some manufactories of cloth and cotton stockings. Besides three churches, it contains 499 houses, and 2576 inhabitants, of whom 654 were returned in the report to parliament, (1802,) as being employed in trade and manufacture. Its arsenal is a substantial and beautiful brick building, 99 feet long, 85 broad, and two stories high. The tower, already mentioned, contains an armoury for 15,000 stands of arms, and 1500 swords, arranged in the manner of the armoury in the Tower of London. This town sends one member to parliament. It is governed by two bailiffs, fifteen aldermen, two chamberlains, two constables, a town-clerk, and other officers. The market days are Wednesday and Saturday: fairs are held here on the 4th of May, 5th July, 10th September, and 17th November. Distance from London by Monmouth 168 miles. N. Lat. 51° 54', W. Long. 3° 12'. (k)

BRECKNOCKSHIRE, a county of South Wales, bounded by Radnor on the north, the counties of Cardigan and Caermarthen on the west, Herefordshire and Monmouthshire on the east, and by Monmouthshire and Glamorganshire on the south. It is said to derive its name from Brecon, famous in legendary story, who succeeded to it about the commencement of the fifth century. This county is about 35 miles in length, 30

in breadth, and 100 in circumference; containing 512,000 acres of land, 232,000 of which are in a state of cultivation; and 185,600 are waste, and unfit for culture. It is divided into the six hundreds of Biulth, Crickhowel, Devynnock, Merthyr, Penkelly, and Talgarth: Its market towns, are Brecknock, Biulth, Crickhowel, Hay; it has 62 parishes, containing 6315 houses, and 31,633 inhabitants; of whom, 14,346 were returned in 1802, as being employed in agriculture, and 4204 in various trades and manufactures.

Sublimity and beauty are strikingly combined in the general scenery of this country. Its mountains, rising in rugged majesty, are separated from each other by cultivated vales; or by glades, whose winding rivers are overhung on either side with the rich and varied verdure of extensive and lofty woods. "Between Slanspyddad and Penpont," says an intelligent tourist, "the scenery is truly enchanting. The Uske, frequently visible from the road, flows on the right amidst oaks of the most vivid green, which feather down the hills from the bottom to the very summit. All the rudeness of nature, and the asperities of surface, are concealed; while, for the space of about a mile, every combination of wood, water, and figure of ground, as viewed from the road, unites to constitute the highest perfection of landscape. In majesty and sublimity, the banks of the Wye infinitely surpass this; but in point of beauty, we had seen nothing comparable to this scene." Beyond Penpont, however, the scenery loses much of its interest. The country becomes more uniform and dull in its aspect; the soil degenerates; and the hills have nothing attractive in their form or appearance, except that they admit of cultivation, which, though it increases their value, diminishes their picturesque effect. The principal mountain in this county is the Vann, or Brecknock Beacon, which is reckoned the loftiest in South Wales. The most important of its rivers, next to the ye, which forms a natural boundary between this county and Radnor, is the Uske, rising from the Black Mountain, and flowing through a fine valley towards the town of Brecknock.

The system of agriculture pursued in Brecknockshire, is nearly the same as that observed in the contiguous county of Hereford; and the whole district abounds in all the necessary articles of subsistence. Its chief commodities are corn, cattle, fish, and otter's fur, besides woollen cloth, and stockings. Near the borders of Glamorganshire, which abound with coal and iron ore, several forges and iron founderies have lately been established.

This county appears to have been governed by native princes till the reign of William Rufus, when Bernard de Newmark invaded it with a large body of English and Normans, and reduced it to subjection. To secure his new conquest, he built castles in various parts of it, and assigned the government of them to his principal officers. With the same view, he married Nest, granddaughter of one of the native princes, whose revengeful spirit involved her lord in endless trouble, and who was so abandoned as to cause her son to be disinherited, by swearing falsely to Henry I., that he was the fruit of an unlawful amour. The lordship progressively passed to Milo, Earl of Hereford, and his sons; to Humphrey de Bohune; to Philip Bruse; to Thomas Plantagenet, sixth son of Edward III.; and afterwards to the duke of Buckingham, till an attainder vested it in the

crown. At the Restoration, James Butler, afterwards duke of Ormond, was created earl of Brecknock.

Besides the antiquities already mentioned in our account of the town of Brecknock, there is a causeway running nearly at right angles with the Isker, and leading probably to the great Roman camp in the neighbourhood. Another Roman road has been discovered near the bridge of Capel Rhyd y Briw, and another along the top of unfrequented mountains. In a field near Brecknock there has also been discovered a Roman hypocaust.

This county is represented by one member in parliament. D. 1108, by Giraldus de Barri, illustrated with Views, Annotations, &c. by Sir Colt Hoare, Bart. 2 vols. 4to. London, 1806; and *An Original Tour in Wales*, in the fourth volume of Philip's *Modern Voyages and Travels*. (k)

BREDA, the capital of Dutch Brabant, was anciently a city of considerable eminence, and was governed by sovereigns of its own. About the year 1100, it was wrested by the Duke of Brabant from the county of Stryen, to which it originally belonged; in 1212, it was held by Godfrey of Bergue as a fief of Brabant; in 1284, John I., Duke of Brabant, conferred the sovereignty of Breda upon Rason de Gavre; in 1326 it was sold to John III., Duke of Brabant; in 1351 it was transferred to John de Polano, Lord of Lieck; in 1404, it passed with his grand-daughter Johanna to her husband Engelbert of Nassau, and remained in the family of Nassau, till William III. of England dying without issue, caused it to be left in abeyance.

Breda suffered severely during the sanguinary struggles in the sixteenth century, between the Spaniards and the United Provinces, and passed in rapid succession from one master to another. In 1567, it was reduced by the Duke of Alva, in consequence of the resistance made by William of Nassau, prince of Orange, to the claims of the crown of Spain; but, in 1577, was again delivered to the states-general. In 1581, it was taken by the Spaniards under Claude de Berlaumont, an officer of the Duke of Parma; but, in 1590, it was regained by Prince Maurice, who sent a party of 60 Dutch soldiers into the place, concealed under planks and turf in a small trading vessel, by whose means he was admitted during the night, and received the submission of the garrison. It is related, that one of these adventurers being unable to refrain from coughing while concealed in the boat, requested one of his companions to put him to death, lest the noise which he made should occasion the discovery and defeat of their enterprise. In 1625, it was invested by Spinola the Spanish general, with an army of 30,000 men, who being well aware of its great strength, made his approaches with the utmost caution, and confined his operations chiefly to a blockade, in the hope of reducing it by famine. The garrison, which consisted of French, Dutch, and English troops, under their respective officers, colonels Hauterive, Lohre, and Morgan, and which amounted only to 7000 infantry, with a few troops of horse, made a most vigorous and gallant defence under the able direction of their commandant Justin of Nassau, natural son of William, Prince of Orange. Besides

maintaining an incessant and spirited fire upon their assailants, they had recourse to various other modes of annoyance; collected an immense bason of water, by stopping the course of the river Merck, and directing it against the quarters of Spinola, swept away numbers of his forces, covered the neighbouring country with water, and introduced so great a mortality into his camp, that there was scarcely 12,000 men fit for service. The Spanish commander, on his part, though labouring under severe sickness, prosecuted the siege with extraordinary skill and perseverance; caused himself to be carried round his works in a litter; visited every post, and directed every operation in person; and having received considerable reinforcements to his army, reduced the besieged, on the one hand, to the greatest extremity, and, on the other hand, repulsed every attempt of the Prince of Orange to raise the siege, or to throw relief into the place. Still the garrison and inhabitants, though severely afflicted with disease and scarcity, as well as hard pressed by the enemy, continued to make the most obstinate resistance; and, by the united good conduct of the governor and magistrates, in the management of their provisions, were able to hold out four months longer than had been calculated. Henry Prince of Orange, seeing no prospect of relieving his faithful subjects, sent a permission to the governor to surrender upon the best terms that he might be able to procure. This note, which had no signature, was intercepted by Spinola, who took care that it should be forwarded to the governor of Breda, and also accompanied it with the offer of an honourable capitulation. Justin of Nassau, however, suspecting that the whole might be a stratagem on the part of the enemy, observed in reply, that a permission was not a command to submit; and though the garrison was reduced to one half of its number, they all resolved to continue the defence till they should receive from their prince a positive order to yield. Henry having been made acquainted with their brave determination, transmitted an express command, that they should surrender to the Spaniards; but requested, at the same time, that he should be informed, by signal, how many days they were still able to hold out; and was answered by eleven fires kindled in different parts of the city. A duplicate of these instructions fell into the hands of Spinola; but though he was thus enabled to understand, by the signals of the besieged, that they must necessarily surrender at discretion within the space of eleven days, he generously resolved to testify his respect for their bravery, by offering them instantly the most honourable and advantageous conditions. These having been accepted, and the garrison, which had sustained a siege of 10 months, and lost two-thirds of their number, having marched through the gates, the Spanish general drew up his army to receive them, complimented the governor, and the officers upon their distinguished good conduct, commanded the sick and wounded to be treated with the utmost tenderness, distributed money among the soldiers, and displayed all the sentiments of a hero, in the testimony which he paid to the merit of the vanquished. In 1637, it was recovered by Henry prince of Orange, after a siege of four months, who requited the generosity of Spinola, by allowing the Spanish garrison to march out with all the honours of war, and loading their gallant commander, Omer de Fourdin, with distinguished praises and valuable presents.

In 1667, Breda was the seat of the famous conference,

in which a general peace was established between Louis the XIV. of France, Charles II. of England, Frederic III. of Denmark, and the government of the United Provinces. In 1793, though the fortifications had been greatly augmented by the Dutch, this important place was surrendered to the French after a siege of ten days; but, in the same year, was again delivered up by capitulation to the States.

Breda is situated at the confluence of the rivers Aa and Merck, in a fertile but marshy country, and capable of being surrounded with water, so as to be altogether inaccessible to an army. It is neatly built, and regularly fortified, surrounded with a wall three miles in circumference, and a ditch well filled with water, protected by bastions and a strong citadel. The whole city is of a triangular form, with a gate built of brick at each angle; and the ramparts are adorned with rows of elm trees. It contains about 20 streets, 2200 houses, and 10,000 inhabitants. Its principal structures are, the castle, a magnificent square building, surrounded by the waters of the Merck; the great church, which is a very handsome edifice, with a remarkable spire 362 feet in height; and the mausoleum of Angelbert or Engelbert II. of Nassau, adorned with various statues and inscriptions. Its woollen manufactures were formerly in a prosperous state, but have greatly declined since the revolution. It is 46 miles south of Amsterdam, and 22 south south-east of Rotterdam. North Lat. 51° 37', East Long. 4° 45'. See Foster's *Travels*. (q)

BREDEMEYERA, a genus of plants of the class Diadelphia, and order Octandria. See BOTANY, p. 267.

BREHONS. See IRELAND.

BREMEN, the capital of a duchy of the same name, is conjectured to have been anciently the *Phabiranum* of Ptolemy, and was known as the seat of an archbishop, in the time of Charlemagne. Its inhabitants were among the most early and zealous supporters of the Reformation; were closely besieged, in 1547, by Groengen, governor of Zealand, at the instance of Charles V.; and were strongly charged by that emperor, at the diet of Augsburg in 1550, on account of their obstinate attachment to the principles of Calvin. In 1644, it was conquered by the Swedes; and, at the peace of Westphalia, in 1648, it was secularized into a duchy and fief of the empire. In 1654, its privileges were violated by Charles Gustavus, king of Sweden, and its walls invested by an army of that prince; but, by the assistance of the elector of Brandenburg and duke of Brunswick, it was enabled to make head against its assailants, till, by the mediation of the Dutch, a peace was concluded at Staden, in which all its privileges were confirmed. In 1675, the town and duchy of Bremen were overrun by the forces of the dukes of Brunswick and Lunenburg; but were retained by Sweden at the peace of Nineguen, in 1679. In 1712 it was reduced by the Danes; but was transferred, in 1715, to the elector of Brunswick, as an equivalent for a sum of 700,000 rix-dollars; and in 1719, it was ceded by the crown of Sweden to that elector, (upon a payment of one million of rix-dollars,) who was afterwards invested by the emperor, as duke of Bremen and Verden. In 1757, the French took possession of the city, but it was hastily abandoned in the year following, when it was instantly occupied by the Hanoverian troops, and remained under the government

of the king of Great Britain as elector of Brunswick, till the late subjugation of all that country to the power of the French emperor.

The town of Bremen is situated upon a kind of peninsula, and is divided by the river Weser into two parts, called the old and the new town, which have communication with each other by means of several bridges; on the largest of which is a hydraulic machine of considerable height, for drawing and distributing water to the different quarters of the city. On the building which contains the wheel is the following inscription:

"Volve Pater, civi tradam tua dona, Visurgis."

The old town is the largest and most populous, and in it the principal inhabitants have their winter habitations, while their gardens and places of residence in summer are in the new town. The streets of the old town are generally very narrow, and the houses very old-fashioned and inconvenient in their structure. The houses in both towns, and in the suburbs, are calculated at 5105, and the number of the inhabitants at 40,000. In the market-place is a large statue of Rolando; and several of the public buildings are very handsome edifices, the chief of which, are the town-hall, loaded with ornaments; the change, a neat modern building; opposite to this a coffee-house, remarkable for the numerous figures in basso relievo on its walls; the arsenal, the college, the Lutheran orphan house, and the Lutheran church. Under the last mentioned structure is a celebrated vault, called the "Bley-keller," or lead cellar, because the lead roof of the cathedral having been melted by lightning, fell into this place, which continues to be so free from moisture, that certain dead bodies, which have been deposited within its walls, have been preserved from putrefaction, and have acquired the appearance of mummies; but its antiseptic virtues have been rated by travellers far beyond the truth. Bremen contains a physical institute, an anatomical theatre, a school for navigation, a considerable library, a museum, which has a tolerable collection of serpents, and other reptiles, with several useful mechanic models, and an observatory, under the direction of M. Olbers, the celebrated discoverer of the new planets Pallas and Vesta. The city is divided into four quarters, each of which has its own court, consisting of a burgomaster and six senators. The predominant religious denomination is the reformed or Calvinistic; and of this persuasion are the magistrates, who generally contrive to choose their successors from their own sect; though the Lutherans are not excluded by law from a share in the government of the town, nor are much inferior in point of number. The revenues amount to about 100,000 rix-dollars, and are levied by a species of property tax. The police is excellent; and the poor are so well provided with work, that no beggars are seen in the place.

The inhabitants of Bremen are rather of a short stature, and form a striking contrast with the tall southern Germans. They are simple and frugal in their manners, and retain many very primitive modes of living. The usual hour of dinner is eleven o'clock in the forenoon; but on Sundays, it is the practice to breakfast at six in the morning, and to dine at ten. They are obliging, frank, charitable, and hospitable in their dispositions; industrious, orderly, and peaceful, in their habits;

possessed in general of good natural abilities, improved by a liberal education; and without much pretensions or display of literature, are well acquainted with the chief subjects of useful knowledge. Though they are little addicted to the arts of luxury, it appears, from a painting in the senate-house, that the use of coaches was known among them at a very early period. In the piece to which we allude, and which is a view of the city painted in 1661, is represented a quadrangular carriage, supported upon four pillars, and covered with a canopy, but open on each side, so as to discover the persons within it.

The principal manufactures in Bremen, are cloth, cards, linen, Osnaburghs, printed calicoes, stockings, bonnets, canvas, cards, corks, glass, starch, and strong beer, for which last article it has long been famed over the continent. It is celebrated also for its Rhenish wine, the sale of which is monopolized by the city, and is confined to the public vaults. It is much engaged in the whale fishery, and carries on a considerable traffic in blubber and whale bone with the south of Germany. Great quantities of salmon, also, are taken by the inhabitants, and are chiefly prepared for exportation by being smoke-dried. Its commerce with France, especially in wines, is very considerable. Its exports in iron, flax, and linen, to England, Spain, and Portugal, are also very valuable; and next to Hamburg, it has more trade with America than any other maritime town in Germany. It is rather remarkable, that the trade of Bremen with foreign countries should be so extensive, when it is considered, that large vessels can ascend the Weser only to within two leagues of the city, smaller ones only to within a league and a half; and that thus all the merchandise, whether export or import, must be loaded and unloaded a second time at Vegesack, which may be regarded as the port of Bremen. It is inferior to Hamburg in population, wealth, and commerce; but it occupies nearly as much ground, and the streets are cleaner and wider, the houses better built, and the whole better planned as a city. Bremen is ten German miles distant from Munden, twelve from Zell, and an equal distance from Hamburg. East Long. 9°, North Lat. 53° 30'. See Holcroft's *Travels*; and Knigge's *Journey to Lower Saxony*. (y)

BRENNER MOUNTAINS, formerly denominated the *Rhetian Alps*, are a chain of mountains in the Tyrol, running in a north easterly direction from Sterzing to Inspruck. The mountain Brenner, from which the chain derives its name, is so called from the frequent thunder storms which rage on its summit; and, according to Beaumont, is only 5109 feet above the level of the sea. The other mountains are Gefron, which rises from the midst of a long course of glaciers, running north-east and south-west, and is one of the highest peaks of the chain, and continually covered with snow; Habichspiz, Tributaan, and Bock-kogo. There are also, on the north-west, mounts Lorenzen, Fartschel, and Tschafatfeh; and, on the south-east, Glander, Schloss, Pragls, and Pallanser. The Brenner mountains rival the Alps in numerous glaciers, and are inferior neither in height nor ruggedness to those of Appenzel. Their summits are entirely bare, and appear to be granitic; while the inferior mountains are calcareous or argillaceous. In the glacier of Stuben, which is 4692 feet above the sea, the granite and porphyry are often covered with calcareous stones, and "it presents," says Pinkerton, "the

usual phenomena of such scenes, with beautiful pyramids of azure, which in sun-shine reflect a blaze of light." The town of Steinach stands nearly in the centre of the chain; and when approaching these mountains from Italy, the ascent is almost gradual from Trent to their highest peak. The high road leading to Innspruck passes over them, extending along their summits nearly 12 miles. It is very secure and agreeable during the months of July and August, but very dangerous in winter, on account of the avalanches. The mountains towards the south are rich in wood and pasturage, but those on the north are bleak and barren. Near the glaciers are found rock crystals of various colours; and the inferior ranges contain mines of silver, copper, lead, mercury, iron, alum, and sulphur. In the valley of Zill, is a mine of gold, but scarcely worth the expense and labour of working it. See Pinkerton's *Geography*, vol. i. p. 387, and Beaumont's *Rhetian Alps*. (L)

BRENTFORD, a market town of England, in the county of Middlesex, is situated on the north bank of the Thames, about seven miles from London. The river Brent, from which it derives its name, passes through it, and divides it into the old and new town; the former of which belongs to the parish of Great Ealing, and the other to the parish of Hanwell. It is a long, straggling, ill-paved town, interspersed with a few good modern built houses; and is inhabited chiefly by shop-keepers and tradesmen. The church is a modern structure, built in the reign of Edward I., but rebuilt in 1764, and serves as a chapel of ease to Great Ealing. Brentford is a place of considerable traffic. Its communication with the capital is greatly facilitated by the Thames, and market boats go every tide to London. The great western road also passes through the middle of the town. Its principal trade consists in making malt, in an extensive distillery, and in the manufacture of bricks, tiles, and earthen ware. It has also a flour mill, on the same construction as the late Albion mills, which, with its other manufactures, affords employment for its numerous poor. About a mile west of Brentford is Sion-house, formerly a celebrated nunnery, now a seat of the duke of Northumberland; and, at the east extremity of the village, on the opposite side of the Thames, are the beautiful gardens of Kew. Brentford is chiefly noted for being the seat of election for the members of the county, when it is the resort of all the rabble of the metropolis. It has two annual fairs for horses, cattle, hogs, goods, &c.; one on the 18th of May, and the other on the 13th of September. It contains 277 houses, and 1443 inhabitants, of whom 334 are returned as employed in various trades. (H)

BRESCIA, anciently named **BRIXIA**, a city of Italy, is the capital of the department of Mella, and chief place of the district of Brescia. It was founded by the Gauls, under the command of Belovesus; or, as others suppose, of Brennus; but afterwards became a colony of the Romans. In 119 it is said to have received the Christian faith, by the preaching of Apollinaris bishop of Ravenna. In 412, it was burnt by Radagassus, king of the Goths; but was rebuilt by Attila in 452. It was afterwards possessed by the Lombards; but was taken by Charlemagne in 771, who founded its church of St Denis. It suffered severely during the various revolutions in Italy, especially in the disputes between the Guelphs and Gibelines; and, during a space of 28 years,

is said to have changed its masters seven times. It was long under the dominion of the dukes of Milan, before it surrendered itself, in 1426, to the republic of Venice. It was taken and pillaged in 1512, by Gaston de Foix, general of Louis XII.; but was again restored to the Venetians by Francis I. in 1517. In 1478, and in 1524, it was visited by a dreadful pestilence, which, at the first of these dates, swept away 25,000 persons. It was taken by the French, under Bonaparte, in 1796; and in 1799 by the Austrians and Russians, to whom the French garrison surrendered as prisoners of war. By the treaty of Luneville, in 1801, it became a constitutional part of the Cisalpine republic, and now belongs to the kingdom of Italy.

It is situated on the small river Garza, at the foot of a range of mountains, in a beautiful plain, filled with trees, covered with flowers, and watered by a multitude of rivulets. It is about a league in circumference, surrounded with good walls, in which are five gates, and defended by a castle, which is placed upon a height, and completely commands the town. The streets are clean and handsome; and most of them washed by small streams from the river. It contains several public squares; the largest of which is surrounded with piazzas, and has the town-house in its centre. It has 19 parish churches, several of which are adorned with fine paintings and statues; 30 convents, a general hospital, a lyceum, and several charitable houses; a palace of justice, which is a magnificent stone building, constructed from the ruins of a temple of Vulcan, and remarkable for its fine architecture and paintings in fresco; and a cathedral, which is a modern edifice, and in which is shewn the famous cross or standard of Constantine. To Cardinal Quirini, who was once bishop of Brescia, and who, besides, contributing liberally to the building of the cathedral, also presented the city with a library, the magistracy, in 1750, erected two marble statues, one of which is placed in the church, and the other in the library. It is the see of a bishop, suffragan of Milan, who used formerly to bear the title of duke, marquis, or earl; and its magistracy, before the revolution, consisted of 600 citizens, divided into several councils, under a noble Venetian, who presided in quality of governor, or *Podesta*, a designation, which seems to have been applied to chief magistrates, even in the time of the Romans, as in the following line of Juvenal;

—Fidenarum, Gabiorumve esse potestas.

Bishop Burnet speaks of Brescia as in his time, "a great town, full of trade and wealth." The inhabitants are very ingenious and industrious, and carry on several flourishing manufactures. It has long been famed especially for its pistol and musket barrels, swords, knives, and other articles of armoury; and, in its neighbourhood are considerable iron mines and forges, in one of which 300 workmen are employed. In the valleys in its environs, are found also copper, jasper, alabaster, touch-stones as black as ebony, and capable of receiving a polish like mirrors; and a peculiar stone, which resists the influence of fire, and from a single block of which they cut a number of pots or vessels, always taking the smaller out of the heart of the larger. There are made also at this place great numbers of mill-stones; the smaller of a soft grey stone, very easily cut, but quickly hardening in the air; and the larger of a kind of

granite studded with calcareous substances. Lintseed oil, but especially grape-stone oil, is made at Brescia in considerable quantities; in preparing the last of which, the following process is followed: The mass, which remains in the wine press, is beaten, kneaded, and sifted, till the stones be separated from the adhering substances; they are then winnowed, by being thrown into the air by a shovel, and left to dry during the space of a month; they are next bruised under a stone, roasted in a copper over the fire, wrapped in a piece of woollen cloth, and, lastly put into the oil-press. The fisheries on the lakes of Esco and Guarda, furnish considerable employment, as well as an important article of traffic to the inhabitants of Brescia and its neighbourhood. In the rivers Adige and Oglio, besides excellent fish, there is found also quantities of gold; and one person, by washing the sand, will gain, ordinarily 12, and sometimes 50 sols a day. The trade in linen and woollen cloths is considerable. That in iron yields 170,000 francs per annum; in flax, 360,000; and in silk, which is the principal manufacture of the place, two millions and a half. The Brescian territories abound in excellent pasturage; and cheese is exported by the peasants to the amount of 130,000 livres annually. To these pastures the people around Lodi, who make the greater part of what is called Parmesan cheese, bring their herds of cows, during the winter half year. One of the peculiar productions of the vicinity of Brescia is a wine called *Santo*, which is of a golden colour, and an agreeable sweetness. In making this wine, the grapes are kept till the month of February, and put into the press when the weather is cold. It is afterwards exposed to a strong degree of cold, that it may not ferment much; and is then sealed up for the space of three or four years. The commerce of Brescia and the fertility of its soil are greatly promoted by the numerous rivers in its vicinity, the waters of which are distributed with the utmost care and economy in all directions; and give motion to an infinity of mills and machinery for spinning silk, manufacturing paper, hammering iron and copper, sawing wood, and boring cannon, &c. These streams are farmed at a high rent; and one proprietor is said to draw 40,000 francs annually for the water on his domains. From the land, through which those canals and rivulets pass, it is common to raise a crop of flax or millet, after one of wheat in the same year; the fields are frequently manured by a crop of lupins, being raised and left to rot on the ground. Its population is about 42,000; its distance from Milan 44 miles, from Mantua 32, from Crema 30; its N. Lat. 45° 31', and E. Long. 10° 5'. See Bishop Burnet's *Travels*, p. 96; Scott's *Itinerario d'Italia*, p. 96.; and Tynna's *Almanach du Commerce pour 1811*, p. 919. (7)

BRESLAU, or BRESLAW, the capital of Prussian Silesia, is one of the largest cities of Germany. Its origin is very uncertain, but it is known to have been a bishop's see in 1033, and to have been burned by the Tartars in 1241. In 1335 it was united to the crown of Bohemia, and its chief magistrates were constituted governors of the whole principality, of which it is the capital. The Emperor Charles IV. shewed great favour to the city, and, in 1348 especially, conferred upon its inhabitants many important privileges, which were still farther augmented by his son Vonceslaus. In 1630 its government was surrendered to the Emperor Ferdinand II. and it continued subject to his successors till the

year 1741, when it was united to the Prussian dominions. In 1757, a small Prussian army, under the command of Augustus William, duke of Brunswick Bevern, was driven from the neighbourhood of Breslau, after a vigorous resistance, and the city compelled to surrender to the victorious Austrians; but, in the space of four weeks, it was recovered by the king of Prussia, and the Austrian garrison, to the amount of 18,000, were made prisoners of war. In this last siege several of its churches were greatly damaged, the library of St Mary Magdalen destroyed by the falling of a bomb, and the greater part of the suburbs burnt to the ground.

Breslau is situated on the south side of the Oder, where that river receives the waters of the Ohlau, and was formerly surrounded by the latter as by a moat. All that part of the town which stands between this stream and the present walls, was added by the Emperor Charles IV.; but the new town is of a still more recent date, and was not inclosed within the fortifications till the year 1529. The whole town and suburbs occupy an extent of two German miles; and among the towns of Prussia it holds the third place, ranking next to Berlin and Königsberg. According to Kuttner, it is a "dirty, old, and dull town," but contains many spacious streets, the houses of which are three, four, and five stories high, exclusive of the ground floor, several large squares, and a variety of magnificent public edifices, which are much obscured with smoke and dirt. The chief of these are, the church of the Augustines, of which the great altar is a remarkable piece of workmanship; the Lutheran church of St Elizabeth, the clock of which is accounted one of the finest in Europe; the Hotel de Ville, from the front of which one of the finest prospects may be seen; the Calvinists church of St Mary Magdalen; the College of the Jesuits; the buildings of the Academy; the Exchange; the Custom-house; the Bishop's Palace; and a monument, erected by his own family, to General Count Tauenzien, who was governor of Breslau, and commanded during the siege of 1760. There is also in this town a college of physicians, a botanical garden, an anatomical theatre, two armouries, a mint, and several public libraries. In the chamber of war and domains is a wooden model of the Giant Mountains, executed by Kahl, who received for it 600 rix dollars. Among the beauties of the place may also be mentioned the walks to certain gardens in the vicinity, especially to the English garden of Prince Hohenlohe at Scheitin. The inhabitants of Breslau embraced the Protestant faith at an early period; and both the magistracy and consistory are of the Lutheran persuasion.

Breslau is the centre of the trade of Silesia; has an easy communication with Hamburg by means of the canal which joins the Oder with the Elbe; carries on an extensive commerce with the north of Germany and the Baltic; and supports various important manufactures, for the encouragement of which many useful establishments have been made. Its merchants instituted, in 1784, a large manufactory for iron wares, which was immediately invested with great privileges by his Prussian majesty; permitted to send its goods to every part of his dominions; to import its raw materials duty free; and to protect its workmen from military service. The other principal productions of the place, are broad cloths, a mixed stuff made of wool and silk, paper, powder, needles, hats, woollen stockings, leather, calicoes, serge,

and various figurers. It is filled with tanners, dyers, and furriers, to whose different operations the waters of the Ohlau, which passes through the town, afford the greatest facilities. Its chief exports are, the linens of Silesia, which are so well known in Europe, and which are purchased at the fair of Breslau chiefly by the Dutch traders; flax, thread, and wool, of which last, however, foreign dealers are permitted to purchase only the surplus of the market; fine cloths, some of which are sent as far as Persia; and madder, which is produced in great abundance in the neighbourhood of the town. On the other hand, it imports, from Bohemia and Moravia, hops, the sale of which is monopolized by the magistrates, who fix the price, and of whom the brewers are obliged to purchase; from Hungary, antimony, orpiment, prunes, honey, saffron, sulphur, tartar, wine, &c.; from Vienna, saffron, quicksilver, ochre, wine, &c.; from Poland, indigo-plant, wax, honey, cotton, coffee, rhubarb, tea, leather, and peltry; from Stettin, and the other ports of the Baltic, French, German, and Spanish wines, spices, herrings, iron, train-oil, lintseed, &c.; from Holland, all kinds of spices, drugs, cloths, sugars, dyeing materials, &c.; from Italy, silks, drugs, spices, dried fruits, and other articles of the Levant trade.

At Breslau there are two great public fairs every year, each of which continues eight days. There are three large market-places; called the *great market*; the *salt market*, where glass, leather, wax, honey, &c. are also sold; and the *new market*, where the wood merchants chiefly transact business. The population exceeds 60,000, of which a great proportion are French, Bohemians, and other foreigners; and immense numbers of Jews had their residence in the city till the year 1744, when the king of Prussia banished them all from the place, except a few of the best known families, and such as were employed in the mint. The lands round Breslau are extremely level; and those parts which are nearest the rivers are of a sandy and swampy nature. It is, however, an excellent corn country, yielding rich pasturage, abounding in sheep and cattle, and remarkable for the large size of its cows. The roads in the immediate vicinity of the town are in a wretched state, but the canals and dykes are kept in good repair. Breslau is 35 German miles from Berlin, 44 from Leipsic, 74 from Hamburgh, 40 from Prague, and 54 from Vienna. E. Long. 17° 3', N. Lat. 51° 6'. See Kuttner's *Travels through Denmark, Sweden, Austria, and Italy*, in 1798 and 1799, letter xvi. Guibert, *Journal d'un Voyage en Allemagne en 1773*, tom. ii. p. 123, Paris, 1803; and Tynna's *Almanach du Commerce pour 1811*, p. 961. (q)

BREST, a sea-port town of France, and formerly capital of the province of Brittany, is now the principal place of a district in the department of Finisterre. It is the *Gesobrivata*, or *Brivata Portus* of the Romans. One of the most remarkable events in its history is an attempt, which was made against it in 1694, by Lord Berkely, with a fleet of 29 ships of war, and a number of other armed vessels, having on board 12 regiments of infantry and two of marines, under the command of General Talmache; but the fortifications of the place had been so thoroughly repaired by Marshal Vauban, and the French so completely prepared to oppose the expedition of the British, that the latter were repulsed, after a desperate conflict, with the loss of 400 seamen, 900 soldiers, and their leader, Talmache, who died of a wound in his thigh.

VOL. IV. PART II.

Brest is situated on the declivity of a hill, at the northern extremity of the bay of Brest; and, when seen from the entrance of the bay, opens in a pleasing manner to the view of the observer, and appears much larger to the eye than it is in reality. The works of the fortifications, mingled with gardens and summer houses, present a very interesting spectacle; and have furnished the celebrated Vernet with the subject of one of his finest paintings. Brest is a large well-built town, and contains several very handsome and regular streets; but the greater part are narrow, winding, and inconveniently contrived. It is divided into two parts, one of which is called the *Cote du Brest*, and the other the *Cote de Recouvrance*, between which there is no communication but by boats. It has two parish churches, a governor, a board of admiralty, and a marine seminary. It is justly considered as the capital of the French marine; and its public buildings, and objects of curiosity, are almost all connected with naval occupations. Those which are most deserving of notice, are its barracks, magazines, rope-walks, sail-cloth manufactories, forges, and foundery, the lodging of the galley slaves, the hospital; the theatre, which is small but elegant; the arsenal, an immense and superb structure; the walk, called *le Cours d'Ajetar de la reunion*, where it was intended that a fine statue of Neptune should be erected; the dock-yard, which is well constructed, but which foreigners, and even Frenchmen themselves, are very rarely permitted to inspect; and the quay, which, on one side of the port, is above a mile in length, and 200 paces in breadth, covered with storehouses nearly throughout the whole of its extent. But it is principally famous for its excellent road and harbour, which are capable of containing 500 ships of war, in an anchorage of 8, 10, and 15 fathoms at low water; and which, next to those of Toulon, are the safest and most spacious on the whole French coast. The entrance, which is from the southwest, is a very narrow and difficult passage; and hence it has received the name of *the Gullet*. It is guarded by a castle on the side next the sea, and on the land side by a large ditch and other strong fortifications. Near this entrance is a flying bridge, or a kind of chest capable of containing five or six persons, suspended by a cable and pulleys, and drawn to either side by a rope, which moves upon a cylinder. Besides the commerce connected with marine armaments, the town of Brest has a considerable trade in wines and brandy, and carries on a fishery in sardines, mackerel, and other fish. There are two fairs held at Brest on the two first days of each month, at which cattle, skins, linen cloths, and other articles of merchandise, are sold. At spring tides it is high water in the port at 3^h 33' 30"; but without the gullet, the tides are $\frac{3}{4}$ ths of an hour earlier. The population of Brest is 26,000. Its distance from Paris is 125 leagues, from Amsterdam 180, from Bourdeaux 100, from Havre 90, from Marseilles 205, from Rochelle 75, from Toulon 212, from Cadiz 300, from Lyons 165; and its N. Lat. 48° 23', W. Long. 4° 30'. See Tynna's *Almanach du Commerce pour 1811*, p. 610. (q)

BRETON, or CAPE BRETON, an island lying near the east coast of North America, between 45° and 47° North Lat., and between 50° and 60° West Long. from London. With the islands Newfoundland and St John, it forms the boundaries of the entrance into the Gulf of St Lawrence; and a narrow passage of about four leagues in length, and half a league in breadth, named the Gut

3 L

of Canso, separates it from the eastern extremity of Nova Scotia. It is about an hundred miles in length, and sixty in breadth, but of a very irregular figure; for it is so much intersected by bays and small rivers, that it has the appearance of a cluster of islands; and its two principal parts are joined by a neck of land not more than eight hundred paces in length. It was discovered about the year 1500 by the Normans and Bretons, who navigated these seas; and being supposed to be a part of the continent, it was named Cape Breton, which name has been absurdly retained. The French took possession of it in 1713, and at a great expence erected Fort Dauphin, which they made their principal settlement; but the harbour having been found to be of very difficult access it was abandoned, and Fort Louisbourg was erected in 1720, the fortification of which is said to have cost them not less than one and a half millions sterling. All the harbours of the island are open to the east and south: the north coast is elevated, and almost inaccessible. The harbour of Louisburg, once among the best in North America, is on the eastern coast. It extends into the country four leagues, in a winding direction, and contains good anchorage, being in all places at least seven fathoms deep. Its entrance, formed by two small islands, is four hundred yards wide; and by means of Cape Lorembic in its vicinity, is discoverable by ships at a considerable distance.

Owing to the number of lakes which overspread one half of the island, and are frozen the greater part of the year, and to the extensive forests which cover the higher grounds, and intercept the rays of the sun, the climate is cold and damp. The soil, which is generally swampy, and covered with a light kind of moss, is but ill adapted for cultivation: On the lands, however, towards the south, considerable quantities of corn, hemp, and flax, are raised; and the island at present abounds with fine hard wood, and excellent timber.

While the French possessed this island, the number of its inhabitants gradually increased to four thousand, who were composed partly of Indians, and partly of ruined adventurers from Europe. They established themselves on all those parts of the coast where they found a proper beach for drying cod, which became the chief object of their attention. As the soil was unfit for agriculture, they did little more than cultivate a few pot herbs for their own sustenance; and the scantiness of the pasture prevented them from rearing cattle. Although the island was covered with forests before it was inhabited, the wood was chiefly used for fuel, and very little timber was exported. An inconsiderable fur trade was carried on in the export of the skins of elks, bears, otters, foxes, and other wild animals. Greater advantages might have been derived from the coal mines, which abound in the island, and which could have been wrought at little expence, as the coal lies in a horizontal direction, not more than seven or eight feet below the surface. But notwithstanding the great demand for that article in New England, these valuable mines were wrought only for the purpose of supplying with ballast the ships which sailed to the French West India islands. The attention of the inhabitants was chiefly directed to the fisheries; the value of which, while the island was in possession of the French, has been estimated at one million sterling. Besides the great export of fish to Europe, part was sent to the French West India islands; in return for which they received sugar, coffee, rum,

and molasses. As the islanders could not consume all these commodities, they were allowed to export what they did not need to Canada; and they received in exchange wood, brick, cattle, vegetables, and various kinds of fruit.

As it was evident that the possession of Cape Breton must at all times, but particularly in a war with France, be a most valuable acquisition to Great Britain, a plan was laid, and successfully executed, for wresting it out of the hands of the French in 1745. The scheme was planned in Boston, recommended by their general assembly, and approved of by his majesty. In New England a body of 6000 troops was formed, under the conduct of a Mr Pepperel, a merchant of extensive influence in that country, who, though unacquainted with military affairs, had taken an active part in proposing and planning the enterprise. While the French garrison at Louisbourg was known to be extremely disaffected to the colony, and to have been for six months almost in open rebellion against its officers, commodore Warren arrived at Canso with ten ships of war, embarked the troops of New England in transports, and landed them in Cape Breton without opposition. The enemy abandoned their grand battery, which was detached from the town, and the immediate seizure of it contributed greatly to the success of the plan. While the 6000 American troops, reinforced by 800 British marines, carried on their approaches by land, the British squadron, under the command of that able officer, blocked up the place by sea, so that no succours could be introduced. The town being considerably damaged by the shot of the besiegers, and the garrison despairing of relief, the governor capitulated on the 17th day of June, and the whole island soon shared the fate of Louisbourg, its only bulwark. A few days after its surrender, two French East India ships, and another from Peru, richly laden with treasure, sailed into the harbour, on the supposition that it still belonged to France, and became prizes to the British squadron.

This valuable possession was restored to France by the treaty of Aix-la-chapelle, in 1748, and was attacked a second time by the British in 1758. About 12,000 men were destined again to undertake the siege of Fort Louisbourg. General Amherst being joined by admiral Boscawen with the fleet and forces from England, the armament sailed from Halifax on the 28th of May, and on the 2d of June part of the transports anchored in Gabarus Bay, a few miles to the westward of Louisbourg. The garrison of that town, commanded by chevalier Druicour, consisted of nearly 3000 men. The harbour was guarded by six ships of the line and two frigates; three ships were sunk across its mouth, in order to render it inaccessible to the English navy; but the fortifications were in bad repair, and no part of the town was secure from the effects of bombardment. The governor had taken every possible precaution to prevent a landing, by establishing a chain of posts for some leagues along the most accessible parts of the beach, by forming entrenchments, and erecting batteries; but some intermediate places could not be fully guarded, of which the British commander resolved to avail himself.

The troops destined to make the attack, under the command of the immortal Wolfe, having been driven from their first landing point by a masked battery, which the French opened upon them with a most destructive fire, he espied a rock at no great distance, which had

always been deemed inaccessible. Thither he directed major Scott to repair, and if possible gain possession of it, while he himself was employed in reembarking his troops. That officer instantly carried his men to the spot; but his own boat sinking at the very moment that he was stepping out, he boldly climbed the rock alone. With the utmost danger and difficulty he reached the summit, and was followed by ten of his men. He was instantly attacked by sixty Frenchmen and ten Indians, and saw two of his men killed, and three mortally wounded. With the remaining five he gallantly maintained his ground, under cover of a thicket, till his brave companions, regardless of danger, came up to his relief, and put him in possession of that important post. As soon as it was gained, the other troops leaped into the water with the utmost alacrity, and reaching the shore, attacked the enemy with such impetuosity in all quarters, that they soon abandoned their artillery, and fled in the utmost confusion. The British stores and artillery were then landed, and the town of Louisbourg was formally invested.

The governor prepared for making a vigorous defence: he maintained a very severe fire against the besiegers from the town and harbour, and made several sallies; but all these were of little avail against the regular approaches to the town, conducted by the engineers under the inspection of general Amherst, and the destructive batteries raised by detached corps under brigadier general Wolfe. In the prosecution of the siege, the admiral and general co-operated with the greatest harmony. In a short time, the ships in the harbour were all taken or destroyed; several breaches were made in the fortifications; forty pieces of cannon were dismounted, or otherwise rendered unserviceable;

and there being no probability of holding out much longer, the governor, in consequence of a petition from the inhabitants, surrendered himself and the garrison prisoners of war. Thus, after having four hundred men killed and wounded, the British obtained possession of the whole of this important island; and found, in the strong town of Louisbourg, two hundred and twenty-one pieces of cannon, eighteen mortars, and a considerable quantity of stores and ammunition. The loss was the more severely felt by France, as it was attended with the destruction of several ships and frigates. This possession was confirmed to Great Britain by the peace in 1763; but since that time, the fortifications of Louisbourg have been destroyed.

This island is of great value to Britain, as it commands the Gulf of St Lawrence, and may be considered as the key of Canada. It secures to her the exclusive possession of the very valuable fisheries on its coasts. It possesses abundance of iron, of which it does not appear that the inhabitants have yet availed themselves. Its extensive coal mines may be wrought at a small expence, the coal (as has been already mentioned,) lying horizontally a few feet below the surface; and as no coal has as yet been discovered in Canada, that article might be rendered a source of great emolument and advantage. Its forests might also supply timber for the navy; the communication with the interior of the island being easy, by means of a number of lakes and inlets from the sea, which are found in every direction. See Gray's *Letters from Canada*, p. 19. Heriot's *Travels through the Canadas*, p. 17; Pinkerton's *Geography*, vol. ii. p. 629; and Smollet's *History of England*, vol. iii. iv. (A. F.)

BREWING.

BREWING is the art of making malt liquors, such as porter, ale, and beer, which have a vast number of local appellations, depending upon their taste, colour, &c.

The art of brewing is of great importance in this country, where the principal beverage of the inhabitants consists of fermented malt liquors, which are generally considered as the least prejudicial to the constitution, of any of those inebriating liquors, which, in the present state of society, are looked upon as essential to the support of the human frame. The practice of brewing porter is brought to great perfection in London, and many other towns are celebrated for their ales, &c.; but the principles upon which these advantages depend, are not perfectly understood. The superiority of particular ales, is generally attributed to local conveniences of water, climate, malt, &c. which might, in a great degree, be attained, from a particular management of the processes upon which the art of brewing depends. It would be presumptuous to attempt to settle the principles of an art so complicated; but we shall endeavour to describe faithfully the different processes of brewing, from the extraction of the virtue of the malt, to the finishing of the beer. This is all that our limits will permit us to accomplish; and we hope it may be found of utility to the practical brewer, in giving him

the detail of the art as practised in London, where porter is brewed on such a large scale, and where the most scrupulous attention is paid to the economy of materials, and the perfection of the process. In doing this, we shall first give a full description of a London brewery, and of the various utensils employed in it; and then a detailed account of the different processes which are employed in this useful art. But before we proceed to any of these heads, we shall first give a general outline of the different operations in brewing.

The principal ingredients employed in brewing beer, are malt and hops, from which the virtues are extracted by solution in hot water, and this extract is fermented with yeast. Malt is made from barley, which being steeped in water, and then spread out in thin layers, vegetates, and produces a sweet substance termed saccharum, which did not previously exist (at least in the same form) in the dry corn, and which disappears if the process of vegetation (or germination as it is called,) is carried too far. In order to prevent this, when the corn is judged, by known signs, to be in that stage which produces the greatest quantity of saccharine matter, the germination is stopped by drying the corn upon a kiln. This evaporates the moisture, and prevents the farther growth of the corn, now converted into malt, which will keep till it is wanted by the brewer. The malt in the

brewer's hands is first ground coarsely, so as to break every grain into 3 or 4 pieces. The malt, or, as it is now called, the grist, is put into a large vessel, termed the mash tun, and hot water admitted into it from the copper, where it remains till the water is supposed to have extracted sufficient sweetness from the *goods*, as the malt is called in this stage of the process. The goods are stirred up at intervals, to expose every part of the mass to the action of the liquor; and for a certain time, at the conclusion of the mashing, it is not disturbed, that the extract (which is called wort,) may not be thick, from holding the gross parts of the flour and mucilage of the malt in mechanical mixture. After being left at rest a short time, these gross parts subside upon the goods; and the wort running through them, when let off, is, in some degree, filtered, and flows clear into a vessel beneath the mash tun, called the under-back. From this vessel it is again pumped up into the copper; and when the hops are put in, it is boiled for some time, in order to extract the bitter of the hops, to coagulate the mucilage extracted from the malt, and evaporate a portion of the water used in mashing. When sufficiently boiled, the wort is run off into a vessel called the hopback, which detains the hops, but permits the liquor to flow into the coolers. These are large vats, not more than 5 inches deep, in which the liquor remains till it is cooled to a proper temperature for the process of fermentation; which gives the strength or spirituous quality to the beer. This is effected in vessels, called squares or gyle tuns, in which a sufficient quantity of yeast is added, to put the liquor in fermentation; the symptoms of which are an internal commotion of every part of the liquor, caused by the extrication of gas, which rises through the fluid in innumerable bubbles, producing an universal motion, and a continual singing, and raising to the surface a constant stream of yeast, in which the bubbles of gas are enveloped. This yeast floats upon the beer, and is called the head. After this fermentation has continued some time, and the head does not seem likely to rise any higher, it is necessary to put a stop to it, as it would be quickly succeeded by another fermentation, called the acetous fermentation: the first being called vinous, producing alcohol or spirit; while the second generates acetic acid, or vinegar. This operation of checking the fermentation is called cleansing. It is performed by drawing off the beer, and putting it into small casks called rounds, where it still continues to ferment and discharge yeast for some time, the casks being filled up as they diminish in their contents. When the working ceases, the casks are bunged up to prevent it from growing flat; and if every thing has been successful, the beer requires nothing but age to fine itself, and be fit for the table. In large breweries, the store of beer is not kept in the small casks, but in immense casks called the store vats, into which it is put from the rounds, as soon as the working ceases. When sufficient time cannot be allowed for the beer to fine itself, (that is, to deposit the mucilage which is suspended in it, and which gives it the appearance of clouds of lighter and darker colours,) a preparation of isinglass and sour beer, called finings, is employed to precipitate the clouds, and render it transparent; a quality which is deemed a great recommendation, as is also a fine colour, which, in some liquors, is produced by colouring. It frequently happens, that the beer does not turn out good, from acidity, flatness,

&c.; and many methods are employed for improving it, by adding various chemical preparations. This was formerly reckoned the most valuable branch of the art, and innumerable nostrums were considered by their possessors as invaluable secrets; but of late the introduction of the thermometer, in the operations of the brewery, has shewn, that more is to be obtained by conducting the previous processes in a proper manner, than by trusting to remedies, for the errors arising from inaccuracy in the heats of the different liquors, or from inattention to the circumstances of the weather. &c.

Having thus given a brief sketch of the process of brewing; we shall now proceed to the description of an extensive brewery, many of which are to be seen in the metropolis.

CHAP. I.

Description of a London Brewery.

The interior of a complete brewery is represented in Plate LXXVII. The dimensions of the different vessels which it contains, are taken from the brewery of Messrs Brown, Parry and Co., Golden Lane, which having been recently rebuilt, contains most of the new improvements in the utensils employed in this manufacture. We have been compelled, in our Plate, to arrange the various vessels, &c. in a different manner from what they are in the brewery itself, where, from many circumstances, such as the form of the premises, want of sufficient room, &c. the arrangement is not quite so uniform as it would have been, if none of these causes had existed at the time of its erection. Fig. 1. is a plan of the brewery, and Figs. 2 and 3 are different elevations of the establishment. The latter are not taken upon any particular line, being chiefly intended to shew the relative levels of the different vessels. The same letters of reference apply to all the figures. A, B represents the two coppers, each containing 300 barrels, having the fireplaces beneath them; *a, a* are their chimneys; and C, D the two mash tuns, situated exactly over the underbacks E and F (Fig. 2.) G is the building for a steam engine of 36 horse power; H the boilers of the engine; *b* its working beam, and *d* its fly wheel. On the axis of this is a bevelled cog wheel, giving motion to a vertical shaft *e*, from which, by means of wheel-work, the power of the engine is distributed through the works. At *f* it works the pumps for raising water from the well to a cistern over the engine house; *l, m*, and *n*, are three other pumps, for raising the liquor in different stages of the process. A shaft *g* drives the four mill-stones *r* for grinding the malt; two others at *h* (Fig. 1.) turn the mashing machines, which agitate the malt while in the process of mashing: *k* is a screw for conveying the grist from the mill towards the mash tuns. It is enclosed in a wooden tube, into which the malt drops, and as the screw revolves it pushes the grist along the tube. The screw is formed by tin plates nailed upon a wooden shaft, which is turned by the mill. This shaft conveys the malt to another screw *o* placed inclined, which elevates the grist into a screwing machine T, through which the ground malt passes; but any grains of malt, which may have escaped the stones without being broken, are separated and delivered between a pair of iron rollers at *i*, which crushes them, and they fall into a screw *v*, which also

receives the grist that has passed through the screw, and conducts all together into the binns, VW, Fig. 2, situated over the mash tuns, where it is kept for use; and when it is wanted, it is let down into the tuns, by drawing a number of shuttles in the bottom of the binns.

Besides these, there are other movements, which cannot be wholly shewn in such small figures; such as at Q, which is a sack-tackle, for drawing up sacks of malt from carts in the street, to the loft in the top of the building. Here the sacks are placed upon a hand-barrow, and wheeled to small trap-doors in the floor, through which the malt is pushed down into the great malt binns S, Fig. 1 and 3, where it is kept till wanted for grinding. It is then filled into sacks again, which are drawn up from the binns by a sack-tackle, and wheeled to the hoppers x, Fig. 2, over the mill-stones. Here the malt is shot into a small binn; and a machine y, called *Jacob's ladder*, elevates it into the hopper. This machine is a broad endless strap, with small tinplate buckets sewed upon it. The strap revolves upon two wheels, one at the bottom, and the other at the top of the lift. The buckets fill themselves with malt in the lowest binn, and throw it into the hopper; as the mill causes it to revolve in the same manner as the chains of buckets employed in some countries to raise water.

The hops are drawn up from the carts by a tackle at Z in the plan, and deposited in the loft 1, (Fig. 3.) When they are wanted for use, the bags are wheeled upon a truck along the different lofts, to the floor level with the top of the coppers A, B, where the bags are cut open, and thrown into the coppers. The steam engine, as before mentioned, works an eight barrelled pump f, Fig. 2. termed the cold liquor pump, which raises the cold water (liquor) from the well, situated at K, and pumps it into an immense cistern N, (liquor-back) placed over the steam engine; to which, indeed, it forms a roof, being 32 feet long, 12 wide, and eight feet in depth. Here the liquor is reserved for use. From the liquor-back it is conducted by a pipe, shewn by the black line 2, 2, 2, Fig. 2, to the coppers A, B, and has sluice cocks to stop or admit it to either at pleasure. In various parts of this pipe are short branches, ending in a screw vessel. To these branches the ends of leather pipes, (hose) such as are used in fire engines, are at pleasure connected by screw sockets, and the liquor, (water) by these, conveyed to any part of the premises; a nose pipe being screwed to the other end of the hose. A jet of water is thrown into any of the vessels in the whole works, to wash and sweeten them, or to fill them with liquor when the brewing is stopped for a time, that the vessels may not dry and crack, so as to leak when again used. The liquor, when heated in the coppers, is let out through large cocks into copper cisterns 4, 4, Fig. 1 and 2, and these communicate by pipes with the mash tuns. The wort, when mashed, is let down by cocks into the under backs. The wort pump n, Fig. 2, has pipes coming from either of the under backs E, F, to take the wort from them, and throw it up into a gutter, 14, 14, conducting it into various parts of the premises, and having plugs in the bottom to let it escape at any particular place. When the wort is pumped up into the copper, it runs into a shallow back, 5, from which it is admitted to either copper at pleasure. After being boiled with the hops, the wort and hops are let off through the cocks; and wooden gutters are hung on the cocks to conduct the wort from

either copper into the jack back X, which has a floor of cast iron plates, pierced with shall holes, to admit the wort, but retain the hops. This wort runs into a cask Y, from which it is drawn by a pipe leading to the wort pump n, and by this it is thrown again into the gutter 14, which conducts it to any of the coolers LL, Fig. 1, 2, and 3, which are very shallow backs, occupying one wing of the building, as shewn in Fig. 1. They are more numerous than they appear to be in the drawing, a cooler being placed in any convenient part of the brewery; for as they require a sufficient number of coolers, to contain at least three or four times the contents of the two coppers, it requires every vacant space to receive them. Those in the wing are placed one over the other, and the building has very large open windows in all its sides, that the air may have free access to the wort in them, in order to cool it as expeditiously as possible. The hops which are left, as before mentioned, in the jack back, are filled, by men, into tubs, which are drawn up by a tackle worked by the engine, and again put into the copper to be boiled a second time, with the second and third wort.

From the coolers, the wort is conducted by pipes 6, Fig. 3, proceeding from each, and uniting before they enter MM, the squares, or gyle tuns, in which the liquor is first put to ferment. From these the beer is conveyed by pipes into a back at 7, Fig. 3, from which the cleansing pump l, Fig. 2, draws and throws it up into a vessel 8, Fig. 2 and 3, called the cleansing batch. It afterwards goes from this to the working tuns at 9, Fig. 2, and 3, beneath the coolers; and, to conclude that operation, it is conveyed by pipes 10, Fig. 3, laid beneath each double row of tuns, with branches which connect them all. One cock fills each double row. The yeast, produced from every four tuns, runs down a wooden pipe into a large cistern 11, (Fig. 3,) where it is drawn off and sent away. The same pipes 10, which fill the rounds, communicate, by other branches, with the starting pump m, Fig. 2. This pump throws up the beer into the starting batch 18, from which a pipe proceeds to the large store vats O, O, Fig. 1 and 3, situated in the other wing of the building. These are immense tuns in which it is kept till wanted for sale, and whence it is drawn off by means of a leather pipe or hose, that conducts it, as at P, Fig. 3, into the small butts, in which it is sent away from the brewery.

The store vats are arranged in one of the wings of the building, as represented in Fig. 1; and over them is the loft 1, Fig. 3. for storing the hops. The space allowed for these in the plan, Fig. 1. is much less than it ought to be, in proportion to the size of the vessels on the *stage*, which is the name given to that part of the brewery containing the mash tuns and coppers. The same may be said of the malt stores situated at S in the plan. This, however, is of little importance, as the spaces alluded to vary in different establishments. Some of the largest of the store vats are 40 feet in diameter, and contain 5000 barrels, and the spaces round these are filled up by others of smaller dimensions. They are all supported upon iron pillars, so as to admit small casks to be stowed beneath them, as shewn in Fig. 3. This arrangement allows easy access to the bottom of the vats for repairs. The pipe which brings beer into the storehouse, is conducted along over the vats, as shewn by the dark line in the plan, and screw vessels proceed from it at proper points, to which hose can be joined to fill any individual

BREWING.

vat. The malt bins are also set on iron columns, to admit casks beneath, and to prevent, as much as possible, the entrance of vermin. The squares are supported in the same manner, to form coal vaults; and the coppers are built upon arches, which are used to increase the coal cellars,—a provision very necessary in such a work, where the daily consumption of coals, for the two coppers and the engine, amounts to near nine chaldrons, of 36 bushels each.

In the two elevations of the brewery, it should be observed, that the different vessels cannot be shewn in their relative positions, otherwise they would fall behind each other. The mash tuns, for example, would in reality come before the mill and pumps, and the engine behind both of these. From this cause, the length of the pipes

and shafts appear much greater in the elevation than they really are.

The reader will now be able to form some idea of the great extent of a brewery, and the excellent provisions which are made for diminishing the labour in every department, in which the steam engine is the chief agent. The establishment delineated in Plate LXXVII, is not on the very largest scale; several works have three coppers, and all their attendant utensils; and some of them, as Messrs Meux's and Whitbread's have four coppers.

The extent of the brewing trade will be seen from the following account of the quantity of porter brewed by the 13 principal houses in London, during the last five years:

Quantity brewed in one year, ending	July 1807.	July 1808.	July 1809.	July 1810.	July 1811.

The water used in most of these works, at least in seven of them which we have visited, is pumped from wells: and there is no foundation for the received opinion, that the superiority of London porter arises from the Thames water. This water was indeed used by all of them some years ago, before the discovery of the excellent and inexhaustible spring, which is to be found beneath any part of London. This city is situated upon a stratum of clay from 150 to 200 feet in thickness, lying upon a stratum of chalk, with the intervention of some sand. The rain falling upon the extensive range of hills which the chalk stratum forms, (by running up gradually for 20 or 30 miles,) is received into the fissures of the chalk, which are always full, up to the level of the clay strata. The water thus poured up flows over at the lowest points of the clay, (covering this immense subterranean reservoir,) forming the rivers Lea, Coln, and New River, which run upon the surface of the clay, into the Thames. Now, by sinking a well 150 or 200 feet deep, and piercing the whole thickness of the clay, the same water may be obtained by perpendicular ascent, which was conducted by the New River at such an immense expence near 30 miles upon the surface. The instant that the clay is pierced, the water rushes up so violently as to fill the whole depth of the well in a few minutes, and sometimes runs over a great quantity. The sand between the clay and the chalk is forced into the well with the water, so as nearly to fill it up, and then it obstructs the free passage of the water. This is remedied by driving down a copper pipe before the clay is quite dug through, and boring out the strata within the pipe. By this means the end of the pipe can be got

down some small distance into the sand. When the borer is removed from this pipe, the water blows up the sand as before in great quantities through the pipe; but its upper end being many feet above the bottom of the well, affords room round it for lodging this sand, without choking the well; and when the well becomes filled, and runs over quietly, the sand does not rise, because the great pressure of water is relieved; but if, (as frequently happens,) the demand for water from the well is greater than the pipe can supply, without sinking the water in the well, the sand will come up. This happened a few years ago as Messrs Meux's well, which was often sunk 100 feet by the continued pumping of the engine; and then the pumps drew up such a quantity of sand as to fill the liquor-back and condensing cistern of the engine half full in a few days.

Much has been said of the qualities of different kinds of water for the purposes of brewing, and writers in general have recommended soft water as preferable to hard. The latter is said to be less inclined to fermentation, and therefore the beer will have less spirit than if made of soft; but, it is more easy to brew transparent liquor from hard water, and it is not so liable to turn sour. Soft water, procured from rivers, often imbibes a great proportion of vegetable extract, and is then so liable to fermentation as frequently to become sour. As we see a general change in the system of the London brewers, from using soft river water, to hard spring water, it is presumptive proof, that the very purity and transparency of the water is of greater consequence than its hardness or softness; and the knowledge of this fact may induce brewers in other situations to place less de-

pendence upon the nature of their water, but to endeavour, by varying the management of their processes, to produce any kind of liquor from any water, (hard or soft,) provided it is clear, sweet, and free from mineral taints.

CHAP. II.

Brewing Utensils.

IN describing the different utensils and vessels employed in a brewery, the mechanism used in the operation of mashing comes first to be considered. The mash tun is usually a large wooden tun, formed of vertical staves bound by iron hoops, as shewn in Fig. 2, of Plate LXXVIII. It has a false bottom placed a few inches above the real bottom. This is pierced with a great number of small holes, to admit the liquor, but retain the malt, which lies upon it as a floor. The liquor is brought by a pipe into the tun beneath the false bottom, and forces its way up through the goods (malt); and when it appears above them, the goods are stirred up, to expose every part of them to the action of the liquor. This was at one time performed by men, first using long rakes to level the heaps of malt, and afterwards rowing the goods with large oars; but the great scale on which the breweries in London are now conducted, renders this method inadmissible, from the number of men it would require. Mashing machines have therefore been generally adopted within the last 20 years, in all the great breweries. A number of different constructions are in use, and seem to answer their purposes well; but as the greatest number have been erected by Mr. Cooper, Old Street, London, we have procured a drawing of one of his construction. The mash tun and underback for this machine are wholly formed of cast iron, to avoid the continual and expensive repairs, which wooden vessels of such large dimensions require. The machine in question was erected in 1809, at Messrs Barclay and Perkin's brewery, Southwark; and the iron tun by Mr Jonathan Dickson, who has a patent for methods of forming various large brewing vessels in cast iron.

Plate LXXVIII. Fig. 1. is a plan of the mash tun, and Fig. 2, an elevation of it; shewing also the underback beneath it; one half of the mash tun being represented in section, to shew the machine within it. AA, Fig. 2. is the level of the stage or floor in which the mash tun is placed. BBBB is the tun, formed of a number of pannels of cast iron plates screwed together. The disposition of these in the bottom is shewn by the plans in Fig. 1. The tun is supported upon 8 cast iron columns DD, which are united at the upper ends by an iron framing E, which confines them in a vertical position, and connects them with a central column F, shewn by dotted lines in Fig. 2. at the upper end. This is cast hollow, to form the continuation of a pipe G, which brings the liquor into the tun from the copper. This pipe has also another branch H, conveying the liquor up into the tun, beneath the false bottom I, which is the only part of this machine made of wood. In the centre of the tun a vertical axis K is set up and turned round by wheelwork communicating with the upper end of it, as shewn in Fig. 3. Upon this axis are two bevelled wheels a and b, giving motion to the mashing engine. These wheels turn two horizontal axes L, M, extending from the centre to the circumference of the tun. The former has 4 wheels upon it, over which pass 4 endless

chains, which also pass round wheels upon a horizontal axis N near the bottom of the tun. Upon the endless chain cross pieces of iron d are fixed; and these have teeth in them, (as is shewn in the elevation, and on a larger scale in Fig. 5.) which, as the chains revolve by the action of the wheel b, raise up the malt from the bottom of the tun to the top of the mass of malt. That this stirring may be performed in all parts of the tun, the frame containing the axes L, M, N, has a progressive motion round the tun, by the following means: On the kirb or upper edge of the tun, is a ring of teeth OO, shewn in the plan. These are engaged by an endless screw, which is mounted in a frame P, and shewn in perspective in Fig. 9. This screw has a rotatory motion, given it by a wheel Q on the extreme end of the axis M, which turns pinions d, e, on the axes of the screw. The wheel has two rings of cogs h and i upon its face, one about $\frac{2}{3}$ ds the size of the other. Each engages its pinion d and e on the spindle of the screw; neither of which are fixed to this spindle, but are at liberty to slip freely round it. Between the pinions, is a circular plate k fitted upon the axis with a fillet, so that it must revolve with it. This plate has studs projecting from both sides, and the pinions have similar studs. Now when the plate k is thrust towards either of the pinions by means of a lever l, it causes the axis and screw to revolve with the same velocity that the pinion has; and as the pinions have different velocities, from being turned by two different rings of teeth, it follows, that by raising or depressing the end m of the lever l, the screw may be turned with either of these velocities at pleasure, and thus cause the machine to make the circuit of the tun in a greater or less time. The extreme ends of the two axes L, N, are supported in an iron arm X, (see Fig. 4) fixed to the iron frame P of the screw, which runs upon the edge of the tun with four rollers. From this frame two rods y y, (Fig. 1.) extend to a frame shewn in fig. 3, which surrounds the central axis, and supports the central axis by a collar at its upper end, and the lower point of the axis is fitted into a socket made through the frame.

The underback R R, which is placed between the 8 iron columns, upon brickwork, supported upon bearing piles, is formed of cast iron plates, united by screws, in the same manner as the mash tun, and as is explained in the Figures. The plates are flat on the inside, but have flanches all round the outside, and ribs across to strengthen them. This is shewn by representing part of the plates as removed. The wort is drawn off from the mash tun, by 8 cocks in the bottom, two of which are shewn at S S, fig. 2. They allow the wort to flow into the underback, whence it is drawn by a pump, the suction tube for which is marked T, and its situation is explained in Plate LXXVII. It will be seen from that Plate, that a large binn is situated over the mash tuns. This receives the grist as fast as it is ground, and here it is reserved till wanted. It is the opinion of some brewers, that the malt, when ground, is the better of being kept some days before it is mashed; but we do not know any reason for this. If this has any effect, it can only arise from exposure to the air; though it cannot have much of this in the close binn over the mash tun, to which it is conveyed by the screw, which is also inclosed in a tight trough, that the fine flour, which will unavoidably be produced in the grinding, may not be lost, as is the case in works where this is not attended to. When the grist is let down into the tun, it is en-

closed by sackcloth, hooked round the edge of the tun, and round the lower edge of the binn, by which means none of the flour is lost in dust in any part of the process.

Besides the mashing engine which we have described, many others of different constructions are in use. One of these invented by Mr Goodwynne, and employed by him in his extensive brewery, is deserving of notice. It is of the figure of a half cylinder, with the central line placed horizontal. In this central line, an iron shaft is fitted, and turned round by wheelwork from the steam engine. It has several iron arms fixed perpendicularly upon it at different parts of its length, which, as the shaft revolves, sweep the whole contents of the tun; and having teeth fixed in them, they effectually mash up every part of the goods. These arms are not all fixed on the same side of the axis, but are arranged at equal angles round it, so as to dip into the goods in succession. When, by their continual motion, the grist is accumulated at one side of the tun, the motion of the shaft is reversed by wheelwork adapted for the purpose, and this brings the grist back again.

Another machine, which we have seen at Messrs Clows and Co. was contrived by Mr. Silvester. It consists of a vertical spindle in the centre of the mash tun; and upon this, an iron arm of a length sufficient to extend across the diameter of the tun, slides up and down, through the depth of the grist. The arm is provided with teeth projecting from one side of it, like a rake; and these teeth are so contrived, that when the arm descends, they hang down vertical, and their points penetrate the goods, without disturbing them; but when the arm reaches the bottom of the tun, the teeth are turned by the machine, so as to be horizontal, and are then drawn up; during which action they raise a portion of the grist, from the bottom to the top. The next time the arm descends, it is turned round with its spindle a few degrees, so as to take a fresh portion of the tun; and in this manner its action continues, till in about 30 or 40 strokes it completes its revolution round the tun. This construction admits of the mash tun being covered close over by large doors, a circumstance of great importance for retaining the heat.

It will be proper to notice here a proposal by Dr Shannon, for a mash tun, which is recommended to be made air tight, and inclosed within another vessel also air tight; the space between them to be filled with steam supplied from the steam engine, or from a boiler made on purpose. This method of keeping up the heat would undoubtedly be attended with great advantages, but some difficulties would occur in the execution of it. Setting aside the enormous expense of two such vessels, it is essential in a mash tun that the malt, after being mashed, can be quickly removed from it, and that when empty the air should have free access to every part of the tun, that it may dry without becoming musty.

A patent for the same purpose was obtained by Mr Long in 1790. He proposes the mash tun to be constructed as usual, but with a small boiler for water by the side of it. From this boiler a pipe proceeds, and entering the tun near its bottom, makes one or two revolutions within it, and communicates the heat of the water which it contains to the goods in the tun. It then passes out again near where it first entered, and delivers the water into a cistern, from which it is pumped up

to the copper, and the place again heated. By this circulation of hot water through the tun, the heat, during the mashing, may be regulated as the brewer thinks most proper. The patentee advises, that the liquor should be first let upon the malt from 20 to 30 degrees lower than usual, and that the wort should be afterwards brought to the proper heat by the small boiler. The same effect may be produced by a small fire-place under the mash tun. We have little doubt but this practice would be attended with some advantages in making a proper extract, and would totally remove the effect of the weather upon the process of mashing.

The next utensil which we have to describe, is the brewing copper. This machine was formerly only an open copper, set in brickwork over a fire place, in the same manner as the boilers which are used for culinary purposes; but in the immense coppers which are now employed, the saving of fuel is an object of great importance, and every means which can tend to this are adopted.

Figs. 1, 2, 3, and 4, of Plate LXXIX., are different sections, to explain the structure of a close copper which contains 300 barrels. AA, in all the figures, denotes the external brickwork, which is a cylindrical wall, built upon the arches, as shewn in Plate LXXVII. In the lower part of this is the ash pit B, and the fire-grate placed over it, being partly supported by iron pillars. CCC is the copper, hung in the brickwork by a projecting ring of a few inches, at the place where the hemispherical dome G joins upon it. The dome is surrounded by a copper from DD, to contain the water which is intended for the succeeding mash, or afterwards for the wort produced by the mash. This liquor is heated with the steam produced by the copper, which is conducted up a large tube E, rising from the center of the dome. To the top of this, four smaller pipes FF, Figs. 2 and 3, are joined, turning down to the bottom of the pan, and open at their lower extremities, by which means the steam is conducted beneath the liquor contained in the pan, and by bubbling up through it, soon communicates to it a considerable degree of heat. A recess is made at X, Figs. 2 and 4, in the copper pan, to expose the dome G; and in this place is the main hole for entering to the copper. Another of these main holes is provided in the top of the copper, at the upper end of a large tube H, Figs. 2 and 4, rising from the dome. I is the chimney to the copper, situated over the fire door a, Fig. 3, and the chimney has an arch in it, to give passage to the fire door. The course of the flues is shewn in Fig. 1, which is a horizontal section, taken a little above the level of the grate bars, upon which the fire rests. On each side of this grate a jamb of brickwork K K is built. This supports the bottom of the copper, and compels the flame and smoke to go backwards, and surround the copper, by rising up in the dark space shewn in Figs. 3 and 4. It then turns round in the two semicircular passages over and behind the jambs K K, Fig. 1, and enters the chimney by the opening at L, Fig. 3. The chimney is double, having a partition up the centre, which divides it into passages, one of which is appropriated to each flue. The opening L is furnished with an iron door, which can be closed at pleasure; and the bottom of the chimneys are likewise shut by iron doors at d, Fig. 3, which slide back horizontally when they are required to be open. By means of these doors the stoker, or fire-man, can at all times regulate the

draught of the fire; for by throwing open the doors *d, e*, and at the same time opening the fire-door at *a* in front, the draught is nearly destroyed, as the cold air passes directly up the chimney without going through the fire; and by closing the door *L*, the draught is totally stopped, and the fire soon extinguished. In the centre of the copper a spindle *M* is fixed, passing through a tight stuffing box. At the top of the tube *E*, and above this, it has a cog wheel *c*, by which the spindle is turned round. On the lower end of the spindle a cross bar is fixed and secured by stays, and short pieces of chain are suspended from it, which drag the bottom of the copper when the spindle is turned round, and stir the hops so as to prevent their burning, which they would do if suffered to rest on the bottom. This apparatus, which is called the *rowser*, is suspended by a swivel at the top of the spindle, from a lever *f*, the opposite end of which is drawn down by a rack and pinion *g'*. This raises the rowser from the bottom of the copper, when it is not in use, and at the same time disengages the wheel *c* from its pinion, which is kept in continual motion by the engine. Cast iron braces *g, g* are fixed across the copper, to support the spindle of the rowser. In the top of the tube *E* is a safety valve, loaded with a weight *h*, to permit the escape of the steam, if it should become so strong as to endanger the copper; and by the side of it is another, *i*, which opens, and admits air, if a condensation of the steam should produce a vacuum in the copper. The man holes are closed by lids which are quite steam tight, and can be quickly opened and shut. Their construction is shewn in Figs. 5 and 6; the former being a plan, and the other a section. In both of them *AA* is a ring of cast iron, which, after being turned in a lathe, and ground perfectly flat and true upon its upper surface, is fitted to the copper by a great number of small screws. The door *BB* is also of cast iron, and has a ring projecting from its under surface to drop into the ring to which the flat surface of the lid is fitted. The lid is hung by a joint *D*, which is very loosely fitted, and is kept down tight by the pressure of a strong screw *a*. This screw is held over the centre of it by a cross bar *E*, fixed to the ring *A*, by a joint pin at the end *f*, while the other end slips under a kind of staple. When the central screw is slackened, the bar can be turned about upon its centre *f*, to remove it from the lid, which can then be opened upon the joint *D*. A balance weight is applied to take off the weight of the lid, as shewn at *Y*, Fig. 4; and within the lid is a smaller one of brass *F*, Figs. 5 and 6, which is fitted in the same manner; and which is removed to introduce the thermometer, or a gauge, for the purpose of ascertaining the quantity of liquor in the copper, without the trouble of moving the great lid, which is only opened to allow men to go into the copper to clean it, while the upper man hole *H* is only used to put in the hops. The copper is filled by a pipe from the liquor-back, as before mentioned. The pipe *R*, Fig. 2, divides into two branches, each of which is provided with a sluice cock *m* and *n*, just before the branches enter the pan from the recess *X*. The branch *m* delivers its contents into the pan, but *n* turns down, and is soldered to the dome of the copper. The pan can be emptied into the copper by two valves *p, p*, Fig. 2, in the bottom of it, which are drawn by iron rods and levers reaching over into the recess *X*. In Fig. 4, *T* is a sluice cock, to draw off the contents of the copper into a copper vessel *Z*, from

which a pipe runs to the mash tun, as shewn in Plate LXXVII. This pipe has a wire cage set over it, to prevent any thing getting from it into the pipe.

The introduction of the close copper into breweries has led to a great saving of fuel, and has, in some measure, prevented the waste of the saccharum and virtue of the hops, which passes off with the steam from the old open copper, as was evident from the strong scent of those substances, which a large one diffused for half a mile round. In the close copper, the steam being passed through the liquor contained in the pan over the copper, the substances alluded to are, in a great degree, condensed and retained in the liquor, though not perfectly so. At the same time the liquor in the pan is heated, and being let down into the copper as soon as the other liquor has run out of it, it is quickly boiled; whereas it would have taken much time and fuel if it had been brought into the copper quite cold. We have been informed, that the first pan was placed over the copper, for the purpose of heating one liquor by the other, by Mr Goodwynne, about 1780; but the steam did not in this case pass through the water. Mr Bramah, about 5 years afterwards, built a copper at Harford's brewery, with a dome and steam pipes, as in Plate LXXIX, Fig. 3, except that the pipes *F* were hung by joints from the great central pipe, so as to rise and fall similar to an umbrella; and a float being attached to the end of each pipe, the steam always passed out under the same pressure of water, whether the pan was full or not, as the floats always kept the mouths of the pipes at the same depth beneath the surface; at the same time, this depth could be readily adjusted by altering the floats, so as to increase or diminish at pleasure the pressure of the steam in the copper. This construction having been found to succeed, has now become common.

Mr Richard Hares took out a patent in 1791, for the construction of a steam head to the copper, such as is shewn in Plate LXXIX, Fig. 1—4; but the patent was set aside, by a trial in the court of king's Bench, on the ground of not being a new invention. In the use of a large brewing copper, great attention is requisite, in taking care that the copper is never empty whilst the fire is burning; for in a very few minutes the bottom of an empty copper would be melted by the intensity of the heat. The fire may always be damped, by opening the fire door and the chimney doors immediately. The cock is opened, and the instant the brewer can see the bottom of the copper, he lets down the contents of the pan. For the same reason, it is proper that men should go down into the copper, and scrape away all the fur which adheres to it, from the stony matter contained in the water; for if that were suffered to accumulate for a few days, it would prevent the water from coming into actual contact with the copper, which would, in that case, be quickly melted or burnt through. The copper plates are not less than three inches thick in the centre of the bottom, and diminish to one inch thick against the flues. They are united by rivets two inches in diameter, and with heads five inches in diameter. When the copper wants repair, a new plate is put into its place while red hot, and hammered down, to fit the edges of the plates with which it is to be connected. The plate is then heated again, and holes punched through it in the proper places for the rivets, which are put in red hot while the plates are cold. They are

introduced through the holes from the lower side; and a workman standing upon the grate, has a hand jack, which he screws up under the head of the rivet, to hold it fast in its place, and immediately three men within the copper batter down the end of the rivet with the utmost expedition. In such thick plates, it is almost impossible to get the joints quite close; but the contraction of the rivets in cooling, draws the plates together so forcibly, as to make them nearly tight, and the leaks cease as soon as the fire is lighted. The very great expence of these repairs, and the loss occasioned by all the works being stopped, render any form of the fire place, which tends to preserve the copper, of very great importance. An improvement in the construction of the fire places was made by Mr Woolfe, who applied it to the coppers at Messrs Meux's brewery, a drawing of which will be found in the *Philosophical Magazine*, vol. xvii. The description of an apparatus, which this gentleman erected at the same works for heating water, by the waste steam which passed off from the coppers, was published by Mr Nicholson in his *Philosophical Journal*, 8vo. vol. ii.

Dr Shannon, as we have already mentioned, took out a patent for an improved brewing copper, which is a cylinder, having its axis placed horizontal, with flues for the flame passing round it in the manner of a screw. The steam of the copper is to be condensed in a vessel for the purpose, and the product returned to the copper. For a similar method of condensing the volatile part of the malt and hops, a patent was taken out by Mr W. Ker in 1788.

Mr Jonathan Dixon has a patent for forming the various vessels in a brewery in cast iron, in the same manner as the cast iron mash tun, which we have described. It has been objected to this iron tun, that it permits the escape of the heat too quickly; a defect which would be easily remedied, by setting the vessel in brickwork instead of supporting it on iron columns. This very objection to the mash tun, is the most forcible recommendation of an iron cooler, where the object is to dissipate the heat of the contained fluid; and the wort would admit of being laid thicker, that is, to a greater depth, than in wooden vessels, in consequence of the iron transmitting the contained heat more quickly than wood; so that a smaller surface of cooler would be sufficient for a brewery; or if the same surface were allowed, the cooling might be more quickly performed. These coolers would be free from the great repairs required in wooden ones, and would not be cracked in hot weather.

Dr Shannon suggests many different forms of coolers in his treatise on brewing. They consist in general of serpentine passages, formed of thin metallic plates, which are to be immersed in cold water, and the wort to run through them, in order to be cooled down to the proper temperature for fermenting. The same principle has been put in practice at Mr Saukey's brewery, Maidstone, by a worm pipe near 800 feet in length, which is immersed in the water well, in the same manner as the refrigeratory of a still. The only objection to either of these methods is, that the sediment which the wort always deposits, more or less, in cooling, would become putrid, and taint the pipe; an evil which is not felt in distillation, as the spirit is perfectly free from any sediment. Dr Shannon, in his patent, proposes a more practicable expedient for cooling the wort, which is, to

have the coolers with a metallic bottom, and a few inches beneath this, another formed of thin boards, between which a constant current of air is to be forced, by obliging all the air, which goes to the fires of the coppers and steam engine, to pass through this space, and take away the heat from the liquor.

The great number of stop cocks which are required in the numerous pipes of a brewery, as shewn in Plate LXXVII., renders their construction a matter worthy of consideration, in so far as regards the expence of their first erection, and their subsequent repairs.

In Fig. 7, of Plate LXXIX., we have represented a sluice cock, where AA is a cast iron frame, having two pillars B rising from it, to support a frame C, which contains a pinion for raising the rack *a*, and drawing the slider D, which stops the bore of the pipe. A flat plate of cast iron is screwed against each side of the frame A, forming a thin box, in which the slider rises and falls. Each of these plates has a short pipe projecting from them, to connect with the pipe, which the sluice is intended to shut up. One of these plates is ground flat, and the slider D is fitted and ground against it, so as to slide freely, but to fit perfectly water tight. On the opposite side of the slider two steel springs *b, b* are bolted. The ends of these act against the other flat plate, in order to press the slider against its fitting, and keep it close. The slider D is connected with the rack by a smooth cylindrical iron rod attached to both, and passing through a stuffing box in the top of the frame A, which is fitted so closely round it with hemp, as to prevent the escape of any fluid by its sides. This kind of sluice cock is very generally used in breweries, as it is the least expensive;—an object worthy of attention, when the large brass cocks, such as are sometimes used for coppers, cost from 30*l.* to 40*l.* and the great weight and size of the plug causes such a friction, that it is difficult to open them with a lever of moderate length.

As the sluice cocks are not sufficiently tight for several purposes, but particularly for the suction pipes of the pumps, unless they are constantly repaired, Mr Thomas Rowntree has made many stop cocks of the form shewn in Figs. 8 and 9, where AA are the flanges for connecting the cock with the pipe, B a chamber, in the centre of which is a spindle *a*, passing through a stuffing box in the lid *b*, and having a handle *c* to turn it round. Upon this spindle a sector of brass *d* is fixed, and when turned about, it either closes or opens at pleasure the opening of the pipe. A piece of brass is screwed into the chamber for the sector to fit against, and they are ground together till they are perfectly tight, by which means the friction is not serious; and as the principal part is made of cast iron, the expence is not very great.

In Figs. 10 and 11, we have given two views of a cock, extremely useful in breweries, which was invented by Mr Bramah. In Fig. 11, A is a conical brass chamber, with three pipes B, C, D, Fig. 10. proceeding from it. The base of the cone is closed by a lid E, in the centre of which another pipe F is joined. Within the chamber a hollow conical plug is fitted, which can be turned round by the handle *a*, and which has a hole on one side of it; and when this is turned opposite to any of the pipes B, C, or D, a passage is opened for the fluid conveyed into the interior cavity of the plug from the pipe F. A cock of this kind answers the purpose of three

or four in distributing the liquor which flows through F, in three or four directions. Fig. 12 represents another excellent stop cock by Mr Bramah. The pipe A, which conveys the liquor, (from the copper for instance,) has the conical chamber B, containing the plug D screwed to it. From the side of this chamber the pipe C proceeds, and is opened when the hole in the side of the plug D is opposite to the end of the pipe. The advantage of this construction is, that the pressure of the fluid always tends to force the plug into its seat, so that no screw or rivet is necessary to hold it in; or, if these are applied by way of precaution, they need not be made tight. The cock, Figs. 10 and 11, is kept tight by the same means, as the fluid enters the base of the cone, and tends to press the plug into its chamber.

Fig. 6, Plate LXXVIII, is a simple and effectual substitute for a cock in many situations of a brewery, particularly at the bottom of the coolers, or any other back, for instance, the back 5, Plate LXXVI, from which the contents are admitted into the pan over the copper. A, is a brass valve seat, which has a conical valve *a*, exactly fitting the seat, and closing its aperture when shut. The seat is fixed down in the wooden bottom of the back, by small screws; and from the seat rises two iron bars, *d, d* uniting at top, and supporting a screw, which is turned round by a handle *e*. The shank *b*, of the valve *a*, has an opening through it, and above this the screw is tapped into it. This opening receives a cross bar of the frame *d*, which, at the same time that it sustains the lower pivot of the screw, prevents the valve shank *b*, from turning round with the screw, which will raise or lower the valve at pleasure.

Fig. 13, of Plate LXXIX, is a contrivance of Mr Bramah's, which at times may be found of great advantage in a brewery. It is a cock to be put in the great store vat for tasting the beer at various periods. An ordinary cock is driven into the cask, in the common way; but it sometimes happens that one of the hoops breaks, from the contraction of the iron in cold weather, or other causes, and falling down the vat, it strikes out the cock, so that the beer may run out for many hours before the accident is discovered. This cock too is always open to the workmen. Mr Bramah's tasting cock, is a brass tube, A, with a shoulder *a*, which is the only projection on the outside of the vat, and is held in by a nut *e*, screwed upon it on the inside of the stave B of the vat. In the end of the tube is a plug *c*, ground and fitted in, and having a hole in one side. The key D of the cock, which is bored through the shank, and also through one of the ends of the cross handle, being introduced into the cock, fits upon a square, a triangle, a circle, or any other figure, at the end of the plug; and when the key is turned round, so that the handle is upright, the cock is open, and the beer will flow through the handle as a spout. This cock cannot be opened without its key, which is always in the possession of the master brewer.

Fig. 7, of Plate LXXVIII, is a small apparatus, which, at Mr Goodwynne's brewery, is used for the purpose of supplying hot water, to wash the casks or butts in which the beer is sent away from the brewhouse. The water is drawn by a cock, from a copper on purpose, and by a short canvass pipe is conducted into the bung hole of the cask. The washing is performed by a man shaking the cask and then pouring out the water. As the attendant cannot see the quantity of water which has

run in before he shuts the cock, he constantly draws too much or too little, and thus wastes either the hot water, or his time.

The copper globe A, is made to contain the proper quantity of water which is brought from the boiler, by the pipe B, and can be admitted at pleasure, by the cock D. The water is conducted into the cask by a pipe E, which has a cock F so connected to the former cock by the rod *a*, that when the one is open the other is shut: a small air pipe *b*, goes from the globe, and rises to the same height as the water stands in the boiler, and is open at top. When D is open and F shut, the water from the boiler fills the globe, the air escaping by the pipe *b*. When the canvass tube E is put into the bung hole of the cask, by turning the handle *c*, the cock F is opened, and the contents of the globe run into the cask, but no more; for D was shut at the same time. By this means a certain quantity of any fluid may be measured out. The object here proposed is so trivial, that we should not have noticed it, but the apparatus seems applicable to many other useful purposes in the arts, where a certain quantity of any article is required to be drawn off at a time. We have seen a similar contrivance, for measuring the corn for feeding horses: a square wooden tube was used instead of the globe, and small shuttles in place of the cocks.

Fig. 8, of Plate LXXVIII, is a section of Mr Bramah's vent peg, to be put into the head of a cask when the liquor is drawn off, in order to admit the proper quantity of air, to allow the liquor to run off. AA is a section of the head of the cask, in which a taper screw B is placed for fastening the apparatus. The upper end of the screw is of large dimensions, and turned out into a cup of a cylindrical form, with a stud or pin rising up in the middle. A hole is drilled through the centre of the peg, to communicate with the interior of the cask at *b*. The cavity surrounding the stud being filled with water, the cap, or thimble C, must be inverted, and dropped into the rabbet, which is turned in the top of the peg. Some small holes are drilled round in the cap at 1 and 2, to admit the air freely; and as the lower edge of the cup is immersed in the water round the stud, nearly to the bottom of the cup, the ingress or egress of the air will be prevented, except when the pressure of the air is augmented, by drawing the liquor out of the cask. This ingenious contrivance will be found very useful in drawing the liquor from the cask, to prevent it becoming flat or vapid from a greater exposure to the air than is necessary.

Having thus given a brief description of the principal utensils used in a brewery, we shall now proceed to some general observations on the different processes of brewing, without reference to the numerous varieties of beer, which are generally manufactured.

CHAP. II.

Account of the various processes employed in Brewing.

SECT. I. Of Malt.

THE nature of the malt, as well as the quantity used, has a most immediate influence upon the liquor which is brewed from it. Malt is of three different kinds, pale, brown, and amber; names derived from their dif-

ferent colours, which depend on the mode of drying the malt upon the kiln. Pale malt is dried with a slow fire, by degrees, and only just so far as effectually to prevent the future vegetation of the corn. Its colour does not materially distinguish it from barley. The malt kiln is a building of the figure of a large inverted pyramid, having a fire grate in its vertex. The base of the pyramid is covered by a floor, upon which the malt is spread to receive the action of the fire beneath, the smoke and heat of which pass through the floor: This floor is constructed of iron bars, supporting tiles, which have large holes made nearly through them, from the lower side, and then very small holes pricked quite through, so as to form an earthen grating. In the modern kilns, wire floors have been used, similar to sieves; and hair cloth spread upon them, has been employed for pale malt. These admit the heat to act on all the sides of every grain, and to dry it equally, without parching the outside. The fuel, for pale malt, is coke, made from Newcastle coals, which are thought to contain sufficient sulphur to render the malt of a light colour. Amber malt is, in all its properties, intermediate between pale and brown malt, which is rendered so by being dried more rapidly, and with greater heat, so that the outside, and part of the flour, is in a measure charred. It is dried upon tiles, or close wire floors, or in some places upon iron plates punched full of holes, or upon cast iron plates. Any kind of coals are used for brown malt; and wood is sometimes employed towards the conclusion of the drying, to make a quick fire, and *blow up the malt*. In this state the malt is considerably expanded, and will occupy a much greater space than before it came to the kiln.

The colour, and a great deal of the flavour of beer, depend on the malt from which it is brewed. Pale malt is used for fine ales, and pale beer; amber malt is used for brown ale and beer, and to mix with pale for brewing porter; and brown malt is used for porter; but as the latter has lost part of its profitable quality of yielding a strong and good wort, many of the London brewers have adopted the plan of brewing porter from mixtures of pale and amber, or from pale malt only; and in such cases they make up the flavour and colour of the liquor, by colouring malt made from burnt sugar, of which we shall speak in its proper place.

It is necessary, before the malt can be mashed with the greatest effect, to grind it, that, the outward husk being broken, the water may penetrate into the interior part of the grain. Every grain should be divided, but not reduced to a fine flour; for in that state the action of the hot water tends to form a tenacious viscid paste, by melting the gluten of such parts of the flour as first come in contact with it, and this envelopes the remainder of the malt, so as to prevent the water from penetrating to extract the fermentable matters; and at the same time, the water which enters into the composition of the paste, will not leave the mash tun when the wort is let off, but a great proportion remains with it; so that malt *low ground* (that is fine), will not produce a wort either so strong, or so much in quantity, as when it is properly ground. The common method of grinding malt is between millstones, in the same manner as flour, but the distance between the stones is made so great as not to cut the grain very fine, while at the same time they do not permit any of the smaller grains to escape without being cut. In order to prevent this,

many of the London brewers have adopted the method of using a screen, as shown in Plate LXXVII, to allow the ground malt to pass through, while it separates the uncut grains, which are broken by being introduced between a pair of iron rollers, similar to those used for flattening iron or other metals. In other works, the rollers are employed instead of the millstones, and in this case it is impossible that any grains can escape unbroken. The external husks are thus rendered pervious to the water, and the violent pressure of the rollers consolidates the flour contained in the corn, so as to prevent the water from saturating it quickly. This will take place in a greater degree in pale than in brown malt; for the latter, from its high drying, becomes far more brittle than malt which is pale.

The millstones in common use, are of that kind of stone, called Cullen stones; a pair of which, three feet three inches diameter, will, with the power of about four horses, grind about 12 quarters, of eight bushels each, per hour. A pair of iron rollers, of about 27 inches in length and 10 inches diameter, will crush 13 quarters per hour, and require about the same power as the millstones. Some breweries have lately employed steel mills, of the same kind with those used for grinding coffee, but on a larger scale. A mill of this kind, of 10 or 12 inches diameter, and performing about 150 revolutions per minute, will grind six or eight quarters of malt per hour, in a very perfect manner. It cuts the grains in the same manner as the millstones; but the malt passing very quickly through the steel mill, the divided parts of the corn are not rubbed to flour, as in the millstones, by being so long under the action of the machine.

SECT. II. Of Mashing.

The object of this process is to extract from the malt all the saccharine matter, and a certain part of farinaceous substance; on the due proportion of which, the proper fermentation of the wort and flavour of the beer in a great measure depends. This is done by two, three, four, and sometimes five, repeated infusions of hot water; the heat of which being properly suited to the nature of the malt, will produce the desirable mixture of fermentable matters; and in this point the skill of the brewer is chiefly shewn, as from the variable nature of the malt it cannot be reduced to any absolute rule; but he must in all cases proceed, in a great degree, according to the existing circumstances.

Cold water will extract from the malt only a portion of those constituent parts which it is the object of the brewer to obtain; and on the other hand, boiling water, which is the greatest heat that can be employed, will have a tendency towards what is called *setting the goods*; and when applied to some kinds of malt, will actually produce this effect. This takes place, when the whole mass of malt in the mash tun mixes with a certain quantity of the water, and forms a pulp or paste, by dissolving the gluten contained in the malt, which is so viscous as to retain almost all the saccharum of the malt, and holds a great proportion of the liquor, so that it will not run out of the mash tun. The boiling liquor, therefore, will neither produce wort of a good quality, nor in any considerable quantity. Between these extremes of temperature, a proper medium must be

sought. It should be so adapted to the malt, as to produce a sweet wort, possessing the colour of the malt from which it is taken, and at the same time transparent when in the underback. Many practical brewers form a judgment of the proper degree of heat, from the wort in the underback bearing a frothy head; but this must be considered as a vague and indefinite criterion. The proper degree of heat will give the strongest wort, and in the greatest quantity; for, if the heat is greater, though the strength of the wort is increased, a greater quantity of wort will be retained among the malt, in consequence of its tenacity. A heat too low will, indeed, produce more wort than the proper medium; but it will be deficient in the fermentable matter which it ought to have extracted from the malt, and, in consequence of this, the beer will be spiritless, and liable to turn sour if kept.

The process of brewing has, of late years, been greatly improved by the application of the thermometer, to determine the degree of heat proper for mashing; but it is extremely difficult to fix with precision what this should be, as it depends upon the combination of so many circumstances. The great advantage, therefore, of the thermometer appears to be, that, when the brewer has by experience succeeded well in a brewing, he may know how to produce the same effect another time. The circumstances to be taken into consideration are,

First, the quality of the malt, the manner in which it has been dried, whether brown or pale, and also the perfection of the malting, by which process the gluten contained in the barley is in part converted into saccharum; and the degree in which this takes place will have some effect upon the mashing heat. The danger of setting the goods wholly or partially, will be in proportion as the malt is well or ill made, from its containing more or less gluten, in proportion to the saccharum; and, therefore, well made malts may be mashed at the highest heats. The heat in which malt has been dried is, by Mr Combrune, made the ground of a calculation to determine the heat of the mashing liquor. He states the lowest heat for drying malt to be 120 degrees for very pale malt, and the highest, which is brown malt, at 150; and he assumes as a principle, that the heat of the extracting liquor should always be in proportion to that in which the malt was dried.

Second, The manner in which the malt has been ground, operates as has been before stated.

Third, The quantity of water in proportion to the malt. This is necessary, because, by admitting the water into a large mass of grist, its temperature is of course diminished more or less in proportion to the quantity of grist, and its temperature at the time, which may be assumed the same as that of the atmosphere. It is observed, that the mixture of malt and water will not be exactly the same as the mean heats of the two, but rather higher, and this increase of temperature is greater in high dried malt than in pale malts: indeed, in some cases of brown malt mashed in twice its bulk of water, the temperature will be as much as 24 degrees hotter than the mean temperature of both water and grist.

Fourth, The quantity of malt which is mashed at one time must be considered; because a large mash tun will hold its heat much longer than a small one, and may therefore be mashed at rather a lower heat.

Fifth, The flavour and nature of the liquor to be brewed has some influence; as, whether it is for keep-

ing or for immediate use; for, since the different constituent parts of the malt are soluble in different degrees of heat, it follows, that more of one and less of another may be extracted by a judicious management of the heat. As this is altogether arbitrary, however, no rule can be given for it, and it must depend upon the fancy of the brewer, or the taste of his customers.

Sixth, The number of mashes which are to be taken from the malt, and the purpose for which each is intended, are to be taken into the account. If the different worts are to be mixed together to produce only one beer, as in porter brewing, the object is then to make all the worts in some degree similar, or, at least, it is not the same, as when the first wort is intended for ale, and the subsequent ones for inferior liquors; for then the utmost is to be extracted from the malt at first, and the next mashes are only taken, that no waste may be made.

Seventh, The time the liquor is intended to be kept has an influence upon the heat; for by extracting too much of those fecula which render the beer turbid, it will require a longer time to precipitate them. Indeed, from too low a heat, it sometimes happens that the liquor will ever remain thick and unpleasant; and, in proportion as the beer is intended for long keeping, the heat must be increased, otherwise it will have a tendency to become acid before it becomes fine.

It will at once be seen, that the degree of heat which depends upon the combination of so many circumstances, cannot possibly be fixed by any certain rule: the extremes may be stated at 145° and 190° of Fahrenheit's thermometer. The actual heat proper for some kinds of beer, we shall state in another place.

In the process of mashing, the hot liquor is let into the tun, beneath the false bottom; and as soon as it appears above the surface of the grist, the mashing machine is put in motion, and continues till the grist and liquor are thoroughly incorporated. It is then left at rest a certain time, before it is run off into the underback, and this time is called the *standing of the mash*, and varies with the nature of the liquor to be brewed. The first mash stands longer, and is taken at a lower heat than the second, which again bears the same relation to the third. After the mash has stood the proper time, the *taph is set*, that is, the cocks are opened to draw off the wort into the underback. The time which the goods are allowed to drain themselves of the wort, in this manner, varies according to the preceding circumstances. If the goods are glutinous, a longer time will be required for the *spending of the taph*, as the drawing off the goods is called. The wort should not be suffered to rest long in the underback, before it is pumped up into the copper pan, to be kept hot; and brewers who have not this convenience are frequently troubled in their operations, from being obliged to hurry them in some stages, that the wort of a previous mash may not wait in the underback till its temperature is lowered; for this would produce a premature fermentation, called by the brewer *foring*, and the beer produced from such wort will ever be nauseous and unpalatable.

SECT. III. *Of boiling the Worts.*

The wort, after receiving in the mash tun the extract of fermentable matter from the malt, requires to be

boiled with the hops, that it may imbibe the essential oil of those plants. Another object of the boiling is, to coagulate the excess of mucilage which is unavoidably extracted from the malt in mashing, for if this were suffered to remain in solution in the beer, it would never become fine, but would always be cloudy, in spite of the most powerful precipitants. The boiling hardens this mucilage in the same manner, probably, as the white of an egg acquires solidity by boiling; and for the same reason, perhaps, as albumen is one of the constituent parts of malt; the boiling curdles the mucilage, before suspended, and equally dispersed through the wort into the distinct fecula, leaving the fluid between them clear and transparent. These fecula are afterwards deposited in the coolers, thrown out in the form of yeast in fermenting, and, lastly, in the lees of the beer, thus freeing it from matters which would otherwise have remained in solution. The heat which is given is that of boiling. In an open copper a greater heat than this cannot be given; but in the close copper, the heat is somewhat increased, by forming steam of sufficient elastic force to raise a column of water, of the depth of the pan. A considerable quantity of water is boiled off in steam, which tends to concentrate the wort, and render it stronger. It is by the quantity thus evaporated that some brewers form their judgment of the wort being sufficiently boiled. Others draw their conclusion from the transparency of the wort, or from its containing fecula. This is called *breaking* of the wort, or curdling. The duration of the boiling is very various among different brewers. It must always be continued till the breaking appears; and perhaps a much longer continuance of the boiling is injurious, for the fecula or flakes of coagulated matter are observed to become larger, the longer the process continues; and from an experiment of Mr Combrune, it appears, that, if these flakes are collected, and boiled in water, the extract will ferment, and yield a viscous liquor. Hence they contain a portion of the fermentable matter, and therefore should not be separated by boiling, farther than is necessary, reserving the minute separation of such matters from the beer to be effected by the fermentation, in the form of yeast and lees.

Thus boiling the wort too short a time, leaves in it more of the gross parts of the extract of the malt than can be thrown out by the fermentation; and at the same time the virtue of the hops will not be sufficiently extracted. On the other hand, too much boiling causes a waste of fermentable matter, by producing more fecula than is necessary for the former condition; and the hops, by being boiled too much, after having given out their agreeable essential oil, communicate a gross bitter oil, which is unfavourable to a sufficient fermentation for producing the requisite spirit in the beer. It will readily be seen, that the medium cannot be attained, without attending to the circumstances of the previous process of the mashing, and the nature of the malt, and also to the quantity and quality of the hops, and the *length of beer drawn*, that is, the quantity of beer intended to be produced from a certain quantity of malt. The greater the portion of the farinaceous matter which has been extracted from the malt, the longer boiling will be necessary to curdle it. This will happen from malt imperfectly made, or from too low heat for the mashing. The first wort is generally boiled a much shorter time than the succeeding one, that the hops may not be so much impaired at the first, but that

they may yield sufficient oil to the second and third worts. One hour for the first wort, two for the second, and four for the third wort, are recommended for beers, which are intended to be kept twelve months, having a large proportion of hops, that is 12lb. to the wort produced by one quarter of malt, and which is intended to be fermented at about 40 degrees of temperature. For small beer only half an hour is necessary for the first wort; one hour for the second; and two hours for the third. The quantities to be evaporated during the boiling are equally various for different kinds of beer; and therefore we cannot say any thing of it in this place, further than that its extremes are from $\frac{1}{3}$ th the quantity of wort to $\frac{3}{4}$ th.

SECT. IV. *Of Hops.*

Hops contain a fine essential oil, which has an agreeable bitter flavour. They are requisite to preserve the beer from the acetic fermentation, which would otherwise take place immediately after the spirituous fermentation ceases. The addition of the hops checks the disposition to ferment in such a degree, that the beer may be kept a sufficient time in a state of slow fermentation, to acquire strength and spirit, and to precipitate the farinaceous matter suspended in it, without becoming sour. On this account, the quantity of hops which are put to the beer, depends upon the length of time it is intended to be kept before it is drunk, on the *length drawn*, and also on the heat at which the beer is intended to be set to work in the gyle tun. The hops are put in the copper and boiled with the first wort, and are again used to boil with the succeeding worts. The quantity is as various as the different kinds of beer. Twelve pounds to the porter produced from 1 quarter of malt is judged sufficient to preserve such beer for 12 months, when fermented at 40 degrees; but, in the heat of 60 degrees, double the quantity of hops will scarcely preserve the beer during the same time. For small beer to be fermented at 40 degrees, 3lb. to the quarter will be sufficient; but at 60 degrees, it will require 6 lb. of new hops, or $6\frac{1}{2}$ lb. of old hops, which are such as have been kept one year, and have, in consequence of this, lost some of their good qualities; but this difference is not worthy of notice, when only small quantities are used. It ought to be observed, that small beer is not generally intended for keeping any considerable length of time. Some breweries, from the great space necessary to store their hops, have in some seasons, when they required a great stock, adopted a method of pressing the bags in a strong press to about $\frac{1}{4}$ their original space, and confining them in this state by cords; a process which is thought to preserve them better than if they were unconfined.

Mr Long, in his patent dated 1790, has recommended the hops to be boiled or macerated in water, sufficient to cover them for 10 hours; at which time, the heat (increased by degrees from the beginning,) is to be only 175°. This gradually increasing heat is to be continued 4 hours longer, and made to boil slowly for the last ten minutes: the extract thus produced is to be let on through a cooler or worm pipe, into the gyle tun, where it is to be mixed with the first wort, which has been boiled a very short time without hops. The hops are to be boiled again twice, in order to make extracts for the second and third worts.

SECT. V. *Cooling.*

This operation is performed by spreading out the boiling wort in a thin sheet exposed to the action of the air, that it may be brought to the proper heat for working or fermenting. It is a great object, that the cooling should be performed as expeditiously as possible; for the taint of *foxing*, before mentioned, is otherwise in danger of overtaking the beer in this process, if it continues as much as 12 hours. The wort, therefore, should be laid at such a depth in the coolers, that they will cool it in about 7 or 8 hours to the temperature of nearly 60 degrees, which, generally speaking, is about the average temperature for pitching or setting to work. To effect this, the wort in summer should not be laid at a greater depth than one, two, or three inches; but in winter, it may be as deep as 5 inches. In the hot summer months the worts must be got as cold as the weather will permit; and it is found that the coldest period of the 24 hours is about 3 o'clock in the morning, at which time, therefore, they should be set to work. In the winter they may be let down at any hour when they arrive at the proper temperature.

The wort should not be suffered to remain in the coolers after they are sufficiently cold, or a slow fermentation may commence, from the sediment left in the cooler by a former process. This, which is called *setting the backs*, is very prejudicial.

SECT. VI. *Of Fermentation in the Gyle Tun.*

From this process, the beer obtains its strength and spirit, by converting the sugar extracted from the malt, into alcohol and spirit, and separating the redundant part of the mucilage in the forms of yeast and lees. In this process, an immense quantity of carbonic acid gas, or fixed air, is given out from all parts of the fluid. During fermentation, the constituent parts of the wort are at first decomposed, and afterwards a recombination takes place in a new order, causing the change above mentioned. The sweet taste of the wort disappears; it loses its viscid, from the separation of mucilage and gluten, which takes place; its specific gravity is considerably diminished; and a spirituous and inebriating quality is given to the liquor. When the wort is let down at the proper temperature from the coolers, into the gyle tun or square, a requisite proportion of yeast is added to it, and in a short time the fermentation commences. Its first appearance is a white line or border on the surface of the liquor, commencing at the sides of the tun, and gradually advancing into the middle, till the whole surface is covered over with a white scum, formed of very minute bubbles of gas, which increase in size as the fermentation advances, and cover the liquor to a depth of several inches with a froth of yeast. The temperature of the fluid increases considerably; and during all this time, the rising of the bubbles of gas, causes an incessant sound and a great agitation of the fluid. Part of the bubbles burst as they arrive at the surface, and the film of yeast which enveloped them sinks, until it is borne up again by the ascending bubbles. These films form at first a yellow, and, as the process advances, a brown dirty covering to the head of yeast, giving it the appearance of rocks. In this state the fermentation is considered as at its crisis, and afterwards diminishes. The yeast, which was at first a thin watery substance,

quickly melting down into a fluid, has now become viscid and tenacious, which is the cause of the increased size of the bubbles, as they will bear greater distension without bursting. When the head begins to sink, which it does, first in the middle of the tun, the fermentation is to be checked by *cleansing*, that is, dividing it into small casks, and allowing any farther yeast which it may produce, to flow off as fast as it is formed. The proper management of the fermentation intimately depends upon the temperature to which the wort is cooled, when the yeast is put to it. The violence of the fermentation is increased with the heat; and if this is too great, the process advances so quick, as not to be readily checked when at its proper stage, but will go on to produce the acetic fermentation either wholly or partially, before it has sufficiently precipitated the mucilage, or, in the language of the brewer, *furged itself*, and consequently it has an unpalatable mixture of acid from the excessive fermentation, and of bitter from the redundant mucilage. In the other excess, that is, too low a heat for the fermentation, the decomposition of the wort takes place; but this, not being succeeded by the proper reunion of the parts, produces an unpalatable half fermented liquor, containing a combination of sweet spirit and bitter, and sometimes an approach to putridity. The medium is to be sought for between 80 and 40 degrees of the thermometer; the exact temperature varying with the circumstances of the preceding operations, the temperature of the atmosphere, and the liquor which is intended to be produced. In some of these (as in strong pale ales,) the object of the brewer is to form a beer of the greatest possible strength and spirit, very clear and fluid, of a fine light colour, without containing much of the vegetable flavour. Such liquor approaches to wine. In the other extreme, as brown ales and porter, a *fullness* of palate, deep colour, glutinous taste, and vegetable flavour, are produced, by retaining part of the farinaceous matter, and giving to it an agreeable taste by the fermentation, rather than expelling it totally, as in the first instance. In making the required varieties, in the manner of the fermentation, to meet these intentions of the brewer, the quantity and quality of the yeast employed, as well as the temperature, must be considered. The yeast produced from the fermentation of strong beer, is the most proper to effect that temperate and regular fermentation of the beer, which is described; perhaps, from the tenacity of its substance, it does not so suddenly communicate the gas it contains to the fluid which it is intended to put in fermentation. The yeast of weak small beers should not be used, when the other can be procured; for, though its fermentable powers are slight, it is apt to act violently for a short time, and then cease, probably from the thin light mucilage, of which the gas bubbles are formed, bursting as soon as they are put in, and communicating their contents to the wort.

When the heat of the atmosphere is more than 60 degrees, the cool of the night must be chosen to put the wort to work. In lower degrees of the atmosphere, the wort must be set at a greater heat than that of the air; for, as the tendency to fermentation increases with the heat of the weather, it is necessary to correct this tendency, by putting the liquor to work colder in hot weather, and hotter in cold weather. If the air is at 30° of Fahrenheit, small beer should be pitched or set to work at about 70°; beer intended for keeping, at 56°; and amber, or glutinous ales, at 54°. When the air is

at 50°, all these kinds of beer may be set to work at 50°. In the process of fermentation, the temperature of the wort is often increased as much as 10°; and it may in general be considered, that the wort will be 10° higher at the height of the fermentation than it was when first put to work, supposing the heat of the air continues the same.

The quantity of yeast has some effect on the degree of the fermentation: a greater quantity will increase the rapidity of the process, in the same manner as a greater degree of heat would, and *vice versa*; hence a greater proportion of yeast is required in winter than in summer. The quantity which will be required at 80°, will be only one-half of that requisite to produce the same effects at 40°. Small beer, not intended for keeping, when the temperature is as low as 40°, will require about eight pints of yeast to the extract of one quarter of malt; at 60° six pints; and at 80° only four pints.

Beer intended to be kept ten or twelve months will not require so large a proportion. Six pints at 40°, five pints at 60°, and three pints at 80°, will be found sufficient. The fermentation in the gyle tun having advanced to that state when the head begins to decline, shews that the vinous fermentation is ended. If the beer is not cleansed just at this period, it will become *yeast bitter*, which gives it an unpleasant flavour, probably from the grosser parts of the yeast being absorbed again in the liquor. The time when these signs will appear varies with the fermenting heat. At 60° it will sometimes require forty hours for the fermentation, though at a greater heat twenty or twenty-four are enough. The liquor is now possessed of some spirit, but is still unpalatable, from the mixture of extraneous farinaceous matter; the wort having parted with nothing in the fermentation but carbonic acid gas. Though the mucilage of the yeast is thrown up in part, it returns again; but the mode of its existence is changed, from the chemical solution it had in the wort, to mechanical mixture: At least this change is partially effected, as is shewn by the turbid appearance of the liquor. If the beer were suffered to remain in the gyle tun, the acetous fermentation would take place, the spirit or alcohol at one time visible in the beer would be lost, and acidity produced. After the acetous fermentation, the beer, under certain circumstances, would produce vinegar, but not in general, for the wort intended for beer has too much of the farina of the malt extracted in the mashing; and the addition of the hops, if in sufficient quantity, will totally prevent it from becoming good vinegar, though it may acquire too much acidity to be drunk, and at the same time bitter, and perhaps putrid in some degree, from the early decomposition of some of its constituent parts; for the acetous fermentation is followed by the putrefactive, which effects a total decomposition of the beer, leaving a putrid disorganized liquor, unfit for any purpose.

SECT. VII. *Of Cleansing.*

The object of cleansing is to stop the fermentation at the proper period, which is effected by drawing off the beer into smaller vessels, usually small casks. This lowers the temperature; for, as the action of fermentation produces an internal heat in the liquor, it follows, that this heat will be diminished by dividing it into

smaller quantities, when, by the casks exposing a greater surface to the external air, the heat is allowed to escape. Notwithstanding the diminished heat, the disturbance of the beer renews the fermentation, probably by incorporating with it the yeast which remained near the surface of the gyle tun. In cleansing, the cask being full, the head of yeast, which rises, flows off immediately at the bung-hole, thus relieving the beer of its dregs, and perfecting the production of spirit which was begun in the gyle tun. As the quantity of beer in the cask constantly diminishes, it is filled up again; and by this means no room is left for a head of yeast to float upon the liquor, but it must flow off and escape as fast as it is produced. This diminishes the tendency to fermentation, which ceases spontaneously in a few days, more or less, in proportion to the heat of the atmosphere; and the beer is ready for storing, and will be fit for the table when it has become quite fine. From what has been already mentioned, it will be seen, that it is of great consequence to keep the casks always completely filled. In the brewery (Plate LXXVII,) this is accomplished by an ingenious contrivance, which requires no attention. The cleansing batch, marked 8, Fig. 2, is left with a quantity of liquor in it, after the rounds 9 9 are all filled, which is done by one pipe 10 communicating with them all; and therefore the liquor stands at the same level in all. A small square cistern is placed by the side of the batch, also communicating with the pipe, and a copper ball floats upon the surface of the liquor in it. The ball is connected by an iron rod, with a valve in the bottom of the batch, which, when open by the sinking of the float, admits the beer to flow into the rounds, till, by raising the surface of the liquor, the float closes the valve. The rounds have close heads, with a small square tube rising up about six inches from it, and having a spout to convey away the yeast. The liquor is adapted to stand some height in this tube, and thus, by means of the float, ensures that the beer shall never have a surface for a head of yeast to gather upon. This is a considerable improvement upon the common method, in which a great number of casks are put upon a frame called a stillion, with their axes placed horizontally, and the bung-hole upwards. They are filled by a hole from the squares; and a man is constantly going round among them, to fill them up as they work off. This method, independent of the expense and trouble, is not so perfect as the one above described. The contents of the rounds 9 9, as drawn in the Plate, is too great to work the beer to the best effect, especially in summer. They may, however, be made much smaller, without altering the principle.

SECT. VIII. *On Tunning, or Storing.*

At the conclusion of the fermentation in the rounds, the beer is drawn off, and pumped into the store vats: This is the plan in the London breweries; but the country brewers bung up the same casks in which it is worked, and keep it in these until it is fit for the table. The immense quantities of beer brewed in London render this impracticable, and they make use of the store vats. Some brewers suppose, that it is better to keep the store in large bodies than in small ones, on account of the great pressure caused by such a depth of liquor; but a greater advantage probably arises from the equality of temperature which such large vessels preserve, not

being so subject to be affected by those changes of weather which are so injurious to the beer, by suddenly exciting a slight fermentation in warm weather, and as quickly checking it in cold. To avoid this, the small casks should be stored in cellars beneath the ground, or the great store vats should be kept in large-buildings, where the sunshine may have as little influence as possible. At Mr Whitebread's brewery, some years ago, two very large cisterns were made underground, and lined with stone and cement; and the beer was kept in these instead of the wooden store vats. They were designed by the late Mr John Smeaton, F. R. S. and executed under his direction.

The beer, if well brewed, will become fine and transparent merely by keeping; but in London, the great capital required in the brewing trade, urges the brewer to send it out, to make a return *in the rough*, as it is termed, when cloudy, without allowing proper time for fining itself. At the same time they send with it a proper proportion of *fining*, which is isinglass dissolved in very sour beer, which they brew on purpose, without hops, from the wort of a fourth mash, taken after all the others. When the cask of beer reaches the innkeeper, he puts a proper proportion of the finings into the cask; and the gluten of the isinglass, mixed with the fecula floating in the beer, forms a net-work at the top of the cask, which gradually sinking down to the bottom, carries all the impurities along with it to the bottom of the cask like a filter.

In London, the beer is drawn from the casks in the publican's cellar by a system of small pumps, which raise the liquor from four different casks up to one place, so that it can be drawn from any for them with equal ease. This gives great facility for the mixing of the different liquors; for, though porter is professed to be entire butt, that is, drawn from one cask, scarcely any of the London porter is so: The universal custom is, for the brewers to send the publican one cask of stale, and three, or sometimes four, of mild porter. The former is that which has an acid taste, from being rather weak and kept longer, and the latter is new. From these the publican draws such a mixture as will suit the taste of his customers.

SECT. IX. On Colouring.

Colouring is used to give a fine brown colour and a peculiar flavour to porter and brown beer. These liquors were formerly brewed from brown malt, and derived their colour from this circumstance; but experience has now pointed out a much more economical method. Brown and other high dried malts owe their colour and flavour to the heat which they receive in the kiln, scorching and partially charring the sugar and flour that they contain. This, at the same time, causes a very great waste of the fermentable matter, which could otherwise be extracted from them in the mash tun; but, by adding a small quantity of burnt or scorched sugar to the beer, the same colour and flavour may be obtained from pale malt, which is found to yield a far greater proportion of fermentable matter than brown malt.

The colouring is made in the following manner: One hundred weight of coarse brown sugar is thrown into a cast iron boiler, of a hemispherical figure, with one gallon of water. This is boiled, and kept constantly stirred, till it turns black, and comes to the consistence

VOL. IV. PART II.

of treacle. The smoke rising from it is now set on fire, and this communicates to the whole, which is suffered to burn about ten or twelve minutes, and is then extinguished by putting on the cover of the boiler. While it is still hot, it is diluted with water, to bring it into a liquid state. Three parts of the sugar will make two of this colour. When it is to be used, it is put into the gyle tun in the proportion of two or three pounds to a barrel; but this entirely depends upon the colour of the malt from which the liquor is brewed, and the colour which the beer is intended to have.

To avoid the prejudice which the public have generally entertained against the introduction of any matters into the beer excepting malt and hops, some porter brewers have of late used a portion of their richest first wort instead of sugar for making the colouring. This is concentrated by boiling it in an iron pan, and is burnt in the same manner as the above. It has some slight advantage over the sugar, as the burning of the farinaceous matter contained in the wort gives it an agreeable bitter. M. De Roche took out a patent, in 1809, for using the husks of the malt for colouring, by burning them to a coffee colour, and mixing them with the malt at the rate of 31 lb. to a quarter of malt; or the water may be coloured before brewing, by infusing in it these roasted skins.

We have now gone through the whole process of brewing; and shall conclude this article by giving the proportions of materials, the heats, &c. for brewing three different kinds of beer. The remarks hitherto made are to be considered as generally and chiefly applicable to brewing on a large scale; but to many of our readers who may be disposed to perform this operation for themselves, some directions may be serviceable. The same principles apply to both public and private brewers; but, as the one mashes perhaps only one quarter of malt, while the other mashes 100 or 150 quarters in one tun, it follows, that the loss of heat in the mashing must be much less in the former case than the latter. In the proportion of hops, the brewer on a large scale has also the advantage. In this case the liquor (porter in particular) is not always intended for keeping any longer than the brewer can obtain a sale for it. Transparency is produced by precipitants, as before mentioned: he gives it colour by colouring, and flavour by mixing mild and stale beer. The private brewer, on the other hand, leaves the beer to fine itself by age, which is always spoken of as its greatest recommendation; and finings are never used but as a remedy. This is, indeed, the grand point on which the difference turns; it is so great, that were the private brewer, in making beer to be kept, to follow the exact proportions which the other uses in *draft* beer, his beer could scarcely fail to become sour before it was fine and palatable, from having such a scanty portion of hops.

SECT. X. Method of Brewing Porter.

This liquor is seldom brewed by private persons, and we have not been able to obtain any correct observations upon the process in the small way. We have indeed seen pamphlets which give receipts for porter, containing a number of heterogeneous ingredients, as treacle, liquorice root, Spanish liquorice, cocculus Indicus, salt of tartar, ginger, lime, cinnamon, lintseed, &c.

3 N

But as we are certain, from actual observations, that no such materials are used in any of the large porter breweries which we have visited, and whose beer is esteemed as good as any, we do not think it proper to mislead the public by such receipts: What follows on porter, therefore, is to be considered as applicable when not less than 50 quarters of malt are used.

The liquor for the first mash should be heated in the copper to 150°, in the proportion of two barrels to each quarter of malt, which is to be an equal mixture of pale, amber, and brown malts. These are mashed about three-fourths of an hour; the liquor is then allowed to stand on the goods an hour. The top of the mash tun is next opened, to let off the liquor as quick as possible; and the top is to be left open till the next liquor is brought into the tun, that the goods may drain. During this the second liquor has been heating, and may, at two hours and three quarters, or three hours from the beginning, have acquired the heat of 160°; the quantity being one barrel to a quarter of malt. Mash this half or three-quarters of an hour; let it stand one hour; and then let it be run off in the course of half an hour more. At about five and one-half hours from the beginning, the third mash should be made at 180°; the quantity being one barrel to the quarter. Mash this half an hour; let it stand one hour; and tap as before.

A fourth liquor is seldom mashed; but if it is, it may be cold or blood-warm, as it is of no use but to make the sour beer for finings; and it is of little consequence how it is done. Some brewers use it for the first liquor of the next brewing; but this is not perhaps a good plan, as it often becomes foxed, and then it taints the whole brewing.

These worts are to be boiled with from 12 to 14 lb. of hops to the quarter of malt, if the liquor is intended for keeping eight or twelve months; but, in the ordinary run of porter not intended for keeping, 5 lb. may be sufficient. The first wort should be boiled one hour, the second two hours, and the third four hours.

The worts are now to be cooled down as expeditiously as the weather will permit, to about 60°, if the medium heat of the atmosphere is about 60°. If it is more or less, allowance must be made, as before directed. All the three worts are to be brought into the square together, and about five pints of yeast to the quarter of malt put in. The time of the fermentation, cleansing, &c. must be regulated by the signs before mentioned. The proportion of colouring is arbitrary, as it depends upon the colour of the malt.

SECT. XI. *Method of Brewing Ale from pale Malt, one part pale and three brown, at the length of three barrels per quarter at three mashes.*

1st, Mash two barrels per quarter, at 183° (170).^{*} Mash three quarters of an hour; let it stand one hour, and allow half an hour to run off the wort.

2d, Mash one barrel per quarter at 190° (183). Mash three quarters of an hour; let it stand three quarters of an hour, and tap as before.

3d, Mash one barrel per quarter at 160° (160). Mash

half an hour; let it stand half an hour; and tap as before.

The first and second wort may be mixed together, boiling them about an hour (1½), with a quantity of hops proportioned to the time the beer is intended to be kept. The third wort should be boiled two and one-half hours. They may be all three mixed together at the heat of 60° or 65° in the gyle tun; or, if strong ale is desired, the first and second may be fermented separately from the third, which will be small beer. The fermenting, and the remainder of the process, is the same as what has been before detailed.

SECT. XII. *Method of Brewing Small or Table Beer.*

From pale malt, the first mash 170°, two barrels per quarter, stands on the goods three quarters of an hour in hot weather, or one hour if cold. Second mash 145°, at one and one-half barrel per quarter, stands half an hour. Third 165°, two barrels per quarter, stands half an hour. Fourth 130°, three barrels, stands two hours. The first wort to be boiled with 6 lb. of hops per quarter, for one hour and a half; the second worts to be boiled with the same hops two hours; and the remainder three hours. The whole to be boiled as low as 55° if the weather permits, and put to work with about five pints of yeast per quarter. If the weather is too warm to get them down to 55°, a less proportion will be sufficient. The eight barrels of liquor first used will be reduced to six of beer to each quarter; one barrel being left in the goods, and another evaporated in boiling, cooling, and working.

It would carry us far beyond our limits to enter into many curious and useful investigations, of which no practical brewer should be ignorant: such as the quantities of liquor lost in the grains; evaporation; the expansion of water when hot; the heat generated in mashing and fermentation; the loss of liquor absorbed in the different vessels; the loss of heat from the liquor running into cold vessels, &c.; the proper choice of malt and hops; the use of the saccharometer, for ascertaining the specific gravities of liquors, &c. For these we must therefore refer our readers to the following authors: Combrune on the *Theory and Practice of Brewing*, a work which has gone through many editions; the last was published in 1804; Richardson's *Theoretic Hints on Brewing Malt Liquors*, 1784; and his *Statistical Estimates of the Materials of Brewing, showing the use of the Saccharometer*, 1784; Baverstock's *Hydrometrical Observations*, 1785; and Dr Shannon's *Practical Treatise on Brewing and Distilling*, 1805. From the latter, which is an excellent work, we have taken the hints mentioned in the methods of brewing porter, ale, and table beer, as we found them in many points corresponding with the practice of experienced practical brewers. See also a work just published, entitled *The Practical and Philosophical Principles of making Malt, in which the efficacy of the sprinkling System is contrasted with the Herefordshire Method*; by John Reynoldson, Esq. (s. r.)

^{*}The numbers within parentheses are to be used when the operation is performed on a small scale.

BRIBERY, in law, is that offence which consists in the giving, or accepting, a reward for the purpose of biasing the receiver in the discharge of some public duty. The term is said to be derived from the French *bribe*, signifying originally a piece of bread, but coming afterwards to denote, generally, a *part* or portion of any thing; as, in the present instance, a part of the unjust gains likely to accrue from the corrupt conduct of the party bribed.

We have defined the offence as consisting, 1st, in *giving*, as well as accepting a reward; for truly the moral turpitude may be as great in the giver as in the receiver; and accordingly, the law of most countries, where bribery is at all punished, chastises both parties as equally as circumstances will permit. We have said, that it consists, 2dly, in giving or accepting a reward; under which term is understood not only every species of reward, but every *promise* or *hope* of it. This reward must, 3dly, be for the purpose of perverting the conduct of the receiver; for it is not necessary, to constitute the crime, that the perversion or bias should actually take place. The giver has done all he could on his part to effect his purpose; and the receiver by accepting the bribe, without disclosing the fact, and making the due exertions to bring the offender to punishment for even this attempt upon his honour, and insult to his character, manifests such a looseness, at least, and corruptibility of principle, that the law will not give him credit for actual purity of conduct. We have said, lastly, that the reward must be given for the purpose of biasing the receiver in the discharge of some public duty. In common language, the term is not thus limited. However private the employment and condition of the party may be in which the corrupt influence appears, it is still denominated bribery. Thus, one is said to be *bribed* to leave his master's service before the expiry of his agreement—to write an abusive anonymous letter—to commit a theft, &c. In law, however, the term is more restricted; and though the code of this and other countries will by no means overlook the instigator of private mischief, yet neither will it pursue him under the specific charge, nor punish him with the proper pains of bribery. But neither, on the other hand, is the offence confined, as is sometimes imagined, to corrupt conduct in the public function of administering law and justice to the community. The malpractices of judges, and inferior officers of the law, form no doubt the most striking, because the most pernicious species of the crime. But the proper guilt of bribery, may also be incurred in the exercise of other public duties—by a burgher in the exercise of his franchise of voting at an election of magistrates—by a candidate for a seat in parliament, as well as by the voter whom he has corrupted—by an officer of the customs or excise—a minister of state in the sale of offices or pensions, &c.; none of whom, though respectively exercising certain public functions, can with propriety be said to be in a judicative capacity.

The punishment of bribery is nearly the same in England as it is in this country, and varies in both according to the degree of the offence. In the former, by 11th Henry IV. it is punished, in the case of judges and officers of the crown, with forfeiture of treble the bribe, chastisement at the king's will, and dismissal from office for ever. In inferior offices, the punishment is fine and imprisonment. By the law of Scotland, the crime, in judges of the Court of Session, is, by 1579, c. 93, vi-

sited with infamy, loss of office, confiscation of moveables, and discretionary punishment in the person of the offender; and in inferior judges and other persons, the chastisement, partly by a variety of statutes, and partly by common law, is the loss of fame and office, payment of the party's costs, reparation of his damages, and other discretionary censure, as the magnitude of the offence may require. Though these, however, are the modes of punishment for cases of ordinary turpitude, yet where the consequences of the bribery are of peculiar atrocity, such as the destroying an innocent man's life by a gross and corrupt perversion of justice, the law in both countries, overlooking the charge of bribery, will visit the offender with the pains of the higher crime in which he has participated. See *Encycl. Method. Jurisprudence* voce *Corruption*. Blackstone's *Comm.* vol. vi. p. 139. Hume on the *Descrip. and Punish. of Crimes*, vol. ii. p. 209. Jacob's *Law Dict.* (J. B.)

BRIBERY AT ELECTIONS, &c. See **PARLIAMENT.**

BRICK, a kind of factitious stone, made of argillaceous earth, formed in moulds, and baked in kilns, or dried in the sun.

This substance is now in very common use as a material for building; and its importance, in many cases, as a substitute for stone, is generally acknowledged. It is lighter than stone, and not so subject to attract damp and moisture; and from the quantities that are now made in Britain, its manufacture has become a considerable object of revenue to the state.

The art of brick making consists chiefly in the preparing and tempering of the clay, and in the burning of the bricks; and as the quality of the ware depends very much upon the right performance of these operations, we shall present our readers with a short sketch of the general process of this manufacture. The earth proper for making bricks is of a clayey loam, neither abounding too much in argillaceous matter, which causes it to shrink in the drying, nor in sand, which renders the ware heavy and brittle. As the earth, before it is wrought, is generally brittle and full of extraneous matter, it should be dug two or three years before it is used, that, by being exposed to the action of the atmosphere, it may be sufficiently mellowed and pulverised, and thus facilitate the operation of tempering. At any rate, it should always have one winter's frost; but the longer it lies exposed, and the more it is turned over and wrought with the spade, the better will be the bricks.

The tempering of the clay is performed by the treading of men or oxen, and in some places by means of a clay mill. If the operation be performed by treading, which is the common way, the earth is thrown into shallow pits, where it is wrought and incorporated together until it is formed into a homogeneous paste, which is facilitated by adding now and then small quantities of water; but the less water that is used, the substance of the clay will be more tough and gluey, and consequently the bricks will be smoother and more solid. This operation is the most laborious part of the process; but it is of essential importance, and therefore ought to be done well; for it is to the negligence of the manufacturers in this respect, that we are to attribute the bad quality of our modern bricks, which are often light and spongy, and full of cracks. Whereas, if the clay be properly tempered, they are hard, ponderous, and durable; much stronger and better fitted for every

kind of building, than those made in the common way. This will appear very evident from the following experiment of M. Gallon. Having taken a quantity of brick-earth tempered in the usual way, he let it remain exposed to the air for seven hours, and then caused it to be moistened and beaten for the space of half an hour: the next morning the operation was repeated; and in the afternoon the clay was again beaten for fifteen minutes more; making the whole additional labour an hour and a quarter. The bricks made of this earth being dried in the air for thirteen days, and burned along with the rest without any particular precautions, were found to be not only heavier than common bricks, but also very different in strength; for on placing their centre on a sharp edge, and loading both the ends, Mr Gallon found, that while it took a weight of 65 lb. at each end to break them, other bricks were broken by the weight of only 35 lb. The improvement in the quality of the article thus far exceeds the additional labour; and none would hesitate to give an additional price, since both the value and the comfort of our dwellings depend so much on the quality of the materials of which they are constructed.

The next part of the process is the moulding of the bricks. This is a very simple operation, and requires very little skill, unless it be to make the greatest number in the shortest time; and the day's labour of a handy workman, employed from five in the morning until eight at night, is calculated at about 5000. The clay is brought to the moulder's bench in lumps somewhat larger than will fit the mould. The moulder, having dipt his mould into dry sand, works the clay into it, and with a flat smooth stick strikes off the superfluous earth. The bricks are then carried to the hack, and there ranged with great regularity one above the other, a little diagonally, in order to give a free passage to the air. The hacks are usually made eight bricks high; and wide enough for two bricks to be placed edgewise across, with a passage between the heads of each brick. In fine weather a few days are sufficient to make them dry enough to be shifted; which is done by turning them, and resetting them more open; and in six or eight days more they are ready for the fire.

Bricks in this country are generally baked either in a clamp or in a kiln. The latter is the more preferable method, as less waste arises, less fuel is consumed, and the bricks are sooner burnt. The kiln is usually 13 feet long, by 10½ feet wide, and about 12 feet in height. The walls are one foot two inches thick, carried up a little out of the perpendicular, inclining towards each other at the top. The bricks are placed on flat arches, having holes left in them resembling lattice-work; the kiln is then covered with pieces of tiles and bricks, and some wood put in, to dry them with a gentle fire. This continues two or three days before they are ready for burning, which is known by the smoke turning from a darkish colour to transparent. The mouth or mouths of the kiln are now dammed up with a *shinlog*, which is pieces of brick piled one upon another, and closed with wet brick earth, leaving above it just room sufficient to receive a faggot. The faggots are made of furze, heath, brake, fern, &c. and the kiln is supplied with these until its arches look white, and the fire appears at the top; upon which the fire is slackened for an hour, and the kiln allowed gradually to cool. This heating and cooling is

repeated until the bricks be thoroughly burnt, which is generally done in 48 hours. One of these kilns will hold about 20,000 bricks.

Clamps are also in common use. They are made of the bricks themselves, and generally of an oblong form. The foundation is laid with *place* bricks or the driest of those just made, and then the bricks to be burnt are built up, tier upon tier, as high as the clamp is meant to be, with two or three inches of *breeze* or cinders strewed between each layer of bricks, and the whole covered with a thick strata of breeze. The fire-place is perpendicular about three feet high, and generally placed at the west end; and the flues are formed by gathering or arching the bricks over, so as to leave a space between each of nearly a brick wide. The flues run straight through the clamp, and are filled with wood, coals, and breeze, pressed closely together. If the bricks are to be burnt off quickly, which may be done in 20 or 30 days, according as the weather may suit, the flues should be only at about six feet distance; but if there be no immediate hurry, they may be placed nine feet asunder, and the clamp left to burn off slowly. Coke has been recommended as a more suitable fuel than either coal or wood for this manufacture, both with regard to the expence, and the proper burning of the bricks; for if this substance be applied, the flues or empty places of the pile, as well as the strata of the fuel, may be considerably smaller; which, since the interference of the legislature with regard to the measurement of clamps, is no small consideration; and as the heat produced by coke is more uniform and more intense than what is produced by the other materials, the charge of bricks has a better chance of being burnt perfectly throughout, so that the whole saving may be calculated at least at 32 per cent.

Mr Goldham observes, that bricks will have double the strength if, after one burning, they be steeped in water and burned afresh. "The excellency of bricks," says Mr Malcolm, in his *Compendium of Modern Husbandry*, "consists chiefly in the first and last operations—in the tempering of the clay, and in the burning of the bricks; and as every man who has occasion to use bricks, whether on his own estate, or on that of his landlord, cannot but be sensible of the great value of a perfectly dry house; and, as it is impossible a house can be dry if bricks are used which are insufficiently burnt, he will do well to consider whether it will be more advantageous to him in the end, to make use of the very best hard sound bricks, be the colour of them what they may, and be the cost of them what they will. Such bricks are easily known by their sound, and by their striking fire with steel." For a more minute account of the various processes of brick-making, we must refer our readers to that author, from whom much of the preceding information has been extracted.

Bricks are made in various forms; but those which are made for sale, and are in common use for building, are required, by act of parliament, to be not less than 8½ inches long, 2½ thick, and 4 inches wide. There are also square bricks, for pavement or facing walls; and cutting bricks, which are used for arches over doors and windows, being rubbed to a centre, and gauged to a height. Various improvements, however, have of late been made in the moulding of bricks; and as the use of this article is daily becoming more prevalent, they are now formed so as to suit almost every purpose in building. Among these improvements, the patent bricks of

Mr Cartwright deserve particular attention. These bricks are formed with a groove down the middle, a little more than half the width of the side of the brick, leaving two shoulders, each of which will be nearly equal to one half of the groove. When these bricks are laid in courses, the shoulders of the first course fit into the grooves of the second, and the shoulders of the second fall into the grooves of the first, thus forming an indented line of nearly equal divisions. The grooves, however, ought to be somewhat wider than the two adjoining shoulders, to allow for mortar, &c. The construction of these bricks is perfectly simple; but the principle will be preserved, in whatever form of indenture they may be made to lock into, or cramp each other. Brick walls, constructed upon this principle, require no bond timber; one universal bond connecting the whole building, which can neither crack nor bulge out without breaking through the bricks themselves. This invention is also particularly useful in the construction of arches; and when employed for this purpose, the shoulders of the bricks and the sides of the grooves should be radii of the circle, of which the intended arch is a segment. It is, however, recommended, that if the arch be particularly flat, or applied in situations which do not admit of end walls, to have the shoulders dove-tailed, to prevent the arch cracking across, or giving way edgewise. In forming an arch, the bricks must be coursed across the centre, and a grooved side of the bricks must face the workmen. The bricks may be either laid in mortar, or dry, and the interstices afterwards filled up by pouring in lime-putty, Paris plaster, or any other convenient material. The obvious advantages of arches constructed upon this principle, are, that the same centre, which, whatever be the breadth of the arch, may be in no case many feet wide, may be regularly shifted as the work proceeds; and as they have no lateral pressure, they require no abutments to prevent their expanding at the foot, nor any weight upon the crown to prevent their springing up. They may be laid upon a common perpendicular wall, and if used in the construction of common buildings, they will not only preclude the necessity, and save the expence of timber, but will also afford an absolute security against the possibility of fire.

A new invention in the formation of bricks, by M. Legressier, has lately been announced in the *Archives des Decouvertes et des Inventions Nouvelles*, pendant l'annee 1809. The principle, however, is merely that of Mr Cartwright's, followed out to a greater extent than has perhaps ever been done in this country. M. Legressier proposes, that the bricks should be formed in seven different moulds, according as they are to be placed in the middle or on the exterior of the walls; in the bottom or on the top; in the arches or in the corners; and by the proper disposition of these bricks in the building, every pressure, either longitudinally or laterally, is resisted, in proportion to the strength of the indentures by which they are locked together. But as our limits will not admit of a detailed account of this supposed new invention, we shall present the reader with the original article.*

Besides the place bricks, and grey and red stocks, which are used in common building, there are marle facing bricks, cutting bricks, fire bricks, and floating bricks. The first of these are of a fine yellow colour, hard and well burnt; they are made in the neighbourhood of London, and are used in the outside of buildings. The cutting bricks are made of the finest kind of marle; and, as we have already observed, are employed in the construction of arches over windows and doors. Fire bricks, sometimes called Windsor bricks, because an excellent kind of them are made at Hedgesley, a village near Windsor. They contain a large proportion of sand, and will stand the utmost fury of fire, and are consequently used for coating furnaces, and lining the ovens of glass-houses. Clay for fire bricks is got at most great collieries, but particularly at Stourbridge, which produces the best clay for this purpose in England. Floating bricks are a very ancient invention: they are so light as to swim in water; and Pliny tells us, that they were made at Marseilles, at Colento in Spain, and at Pitane in Asia†. This invention, however, was completely lost, until M. Fabbroni published a discovery of a method to imitate the floating bricks of the ancients.‡ According to Posidonius, these bricks were made of a kind of argillaceous earth, which was employed to clean silver plate. But as it

* "M. Legressier a pensé qu'on pourrait perfectionner la fabrication des briques en leur donnant une forme particuliere. Il propose des briques a enclaves composées d'une enclave principale, et donnant sept moules differens, y compris les encoignures, les cintres et les plans circulaires. Ces enclaves forment les parties saillantes, et les entailles les parties rentrantes; l'une et l'autre sont à queue d'aronde ou à biseaux. Les divisions et les oppositions des enclaves et des entailles sont les mêmes, et correspondent ensemble; la coupe en diffère, en ce que les angles sont aigus sur les faces laterales pour former les queues d'aronde, tandis qu'ils son droits sur les faces d'assises, afin d'offrir les enclaves à biseaux.

Dans le système de l'auteur, il y a des briques de plusieurs formes, suivant qu'elles doivent être placées au milieu de la maçonnerie, en premier lit, en dernier lit, sur les faces extérieures des murs, aux angles ou dans les parties courbes.

Lorsque ces briques doivent être placées au milieu des murs, elles ont des parties saillantes et rentrantes sur leurs six faces; savoir, quatre à queue d'aronde sur les faces laterales, et deux à angles droits sur les parties inférieure et supérieure. Lorsque elles sont destinées à être en premier lit, en dernier lit, ou disposées sur les faces extérieures des murs, les parties saillantes ou rentrantes, qui formeraient alors des inégalités inutiles, sont supprimées. Quant aux angles, une autre disposition dans les queues d'aronde y pourvoit. Pour les parties courbes, ces briques forment les coin, en conservant toujours leur réunion entr'elles.

Il résulte de ces dispositions qu'un mur construit en briques pareilles, apporte une résistance à se séparer longitudinalement et lateralement, proportionnelle à la force des queues d'aronde.

L'auteur assure que ces briques s'opposent aux poussées, et previennent même les écartemens; qu'elles ne peuvent permettre le tassement que d'une maniere egale sur tous les points d'une fondation: qu'elles procurent économie de matiere pour les pierres de taille et moellons, économie de temps pour les transporter et la taille de ces pierres, et enfin que la régularité de la jonction de ces briques dispense presque de se servir de plomb et de cordeau pour les poser.

Ces briques etant fabriquées dans des moules en metal auront une precision parfaite qui ne permettra pas de les confondre, et ne sera pas alterée par le ciment; car on ne devra se servir pour les réunir que de chaux vive réduite à la consistance d'une bouillie."

† *Nat. Hist. lib. xxxv. cap. 14.*

‡ This small work consists only of 24 octavo pages, and was published at Venice, under the following title: *Di una singolarissima specie di mattoni ossia ritrovamento degli antichi mattoni gallegianti, dissertazione letta nella publica adunanza del Georgofili di Firenze, l'anno 1791, dal Signor Fabbroni.*

could not be our tripoli, which is too heavy to float in water, M. Fabbroni tried several experiments with mineral agaric, guhr, lac-lunæ, and fossil meal, which last was found to be the very substance of which he was in search. This earth is abundant in Tuscany, and is found near Casteldelpiano, in the territories of Sienna. According to the analysis of M. Fabbroni, it consists of 55 parts of siliceous earth, 15 of magnesia, 14 of water, 12 of argil, 3 of lime, and one of iron. It exhales an argillaceous odour, and when sprinkled with water, throws out a light whitish smoke. It is infusible in the fire, and though it loses about an eighth part of its weight, its bulk is scarcely diminished. Bricks composed of this substance, either baked or unbaked, float in water; and a twentieth part of argil may be added to their composition without taking away their property of swimming. These bricks resist water, unite perfectly with lime, are subject to no alteration from heat or cold, and the baked differ from the unbaked only in the sonorous quality which they have acquired from the fire. Their strength is little inferior to that of common bricks, but much greater in proportion to their weight; for M. Fabbroni found, that a floating brick, measuring 7 inches in length, $4\frac{1}{2}$ in breadth, and one inch eight lines in thickness, weighed only $14\frac{1}{2}$ ounces; whereas, a common brick weighed 5 pounds $6\frac{3}{4}$ ounces. The use of these bricks may be very important in the construction of powder magazines and reverberating furnaces; as they are such bad conductors of heat, that one end may be made red hot, while the other is held in the hand. They may also be employed for buildings that require to be light; such as cooking places in ships, and floating batteries, the parapets of which would be proof against red hot bullets. The turrets which were raised on the ships of the ancients, says M. Fabbroni, were perhaps formed of these bricks; and perhaps they were employed in the celebrated ship, sent by Hiero to Ptolemy, which carried so many buildings, consisting of porticoes, baths, halls, &c. arranged in mosaic, and ornamented with agates and jasper.

Bricks appear to be of the highest antiquity; and, as we learn from sacred history, the making of them was one of the oppressions to which the children of Israel were subjected during their servitude in Egypt. The bricks of the ancients, however, so far differed from ours, that they were mixed with chopped straw in order

to bind the clay together, and instead of being burned were commonly dried in the sun. Vitruvius recommended, that they should be exposed in the air for two years before they were used, as they could not be sufficiently dry in less time; and by the laws of Utica, no bricks were allowed to be used, unless they had lain to dry for five years. From Dr Pocock's description of a pyramid in Egypt, constructed of unbaked bricks, it appears that the Egyptian bricks were nearly of the same shape as our common bricks, but rather larger. Some of those he measured were $13\frac{1}{4}$ inches long, $6\frac{1}{2}$ broad, and 4 inches thick; and others 15 inches long, 7 broad, and $4\frac{3}{4}$ thick. The bricks used by the Romans were in general square; and M. Quatremere de Quincy observes, that in his researches among the antique buildings of Rome, he found them of three different sizes. The least were $7\frac{1}{2}$ inches square, and $\frac{1}{2}$ thick; others $16\frac{1}{2}$ inches square, and from 18 to 20 lines in thickness; and the larger ones 22 inches square, by 21 or 22 lines thick. Among the celebrated buildings of antiquity, constructed of brick, were the tower of Babel, and the famous walls of Babylon, reckoned by the Greeks among the wonders of the world; the walls of Athens, the house of Cræsus at Sardis, and the walls of the tomb of Mausolus. The paintings, which were brought from Lacedæmon to Rome, to ornament the Comitium in the edileship of Varro and Murena, were cut from walls of brick; and the Temple of Peace, the Pantheon, and all the Thermæ, were composed of this material. The Babylonian bricks, which are in the possession of the East India company, and upon which Dr Hayes has lately favoured the public with a dissertation, are inscribed with various figures and characters, and are supposed by some to be a part of that brick work, upon which Pliny tells us that the Babylonians wrote the observations which they made of the stars for seven hundred and twenty years. BRIDGE.

THERE are few operations of art in which mankind are more deeply interested than in what relates to bridges. The ingenuity and hazard involved in constructing them; the numerous advantages derived from them; their being from objects of utility, in many instances, raised into all the magnificence which science and power can exalt them; justify us in treating the subject at considerable length, and endeavouring to exhibit under one article, most of the material circumstances which are connected with it.

In order to accomplish this, we shall first, in a cursory manner, trace the history of bridges; secondly, state the theory and principles upon which the rules, which ought to guide the engineer, are founded; and thirdly, explain what relates to the practice of bridge building.

HISTORY OF BRIDGES.

The construction of perfect bridges, being a very complex operation, cannot have taken place amongst a rude and uninformed people; and in the course of this discussion it will be seen, that this did not always correspond with the progress of the other arts, even in situations where the intercourse was great.

The most obvious and simple bridge is that formed by single trees thrown across small streams, or, in case of broader streams, by fastening the roots of a tree on each bank, and twisting together their branches in the middle of the stream. These must have frequently occurred by chance, and they fall within the comprehension of the hunter; accordingly Mr Park found even

the latter mode practised on rivers in the interior of Africa.

The next step is not much more complex, for in a space too great for the beforementioned operations, few manual arts were required to form ropes of rushes or leathern thongs, to stretch as many of them as were necessary between trees or posts on the opposite banks, and connect and cover them so as to form a slight bridge. The following accounts, given by Don Antonio de Ulloa, will afford a distinct notion how these sorts of bridges were constructed and used in the mountainous parts of South America. See vol. ii. page 164. London, 4th edit. 8vo.

"Over the river Desaguadero is still remaining the bridge of rushes, invented by Capac Yupanqui, the fifth Ynca, for transporting his army to the other side, in order to conquer the provinces of Collasuyo. The Desaguadero is here between eighty and a hundred yards in breadth, flowing with a very impetuous current, under a smooth, and as it were, a sleeping surface. The Ynca, to overcome this difficulty, ordered four very large cables to be made of a kind of grass which covers the lofty heaths and mountains of that country, and called by the Indians, Ichu; and these cables were the foundation of the whole structure. Two of these being laid across the water, fascines of dry juncia and tortora, species of rushes, were fastened together, and laid across them. On these the two other cables were laid, and again covered with the other fascines securely fastened, but smaller than the first, and arranged in such a manner as to form a level surface; and by this means he procured a safe passage to his army. This bridge, which is about five yards in breadth, and one and a half above the surface of the water, is carefully repaired, or rebuilt every six months, by the neighbouring provinces, in pursuance of a law made by that Ynca, and since often confirmed by the kings of Spain, on account of its prodigious use; it being the channel of intercourse between those provinces separated by the Desaguadero."

Again, in vol. i. page 430: "When the rivers are too deep to be forded, bridges are made at the most frequented places. Of these there are two kinds besides those made of stone, which are very few: the former of wood, which are most common; and the latter of bujuco. With regard to the first, they choose a place where the river is very narrow, and has on each side high rocks. They consist of only four long beams laid close together over the precipice, and form a path about a yard and a half in breadth, being just sufficient for a man to pass over on horse-back; and custom has rendered these bridges so natural to them, that they pass them without any apprehension. The second, or those formed of bujuco, are only used where the breadth of the river will not admit of any beams to be laid across. In the construction of these, several bujuco are twisted together, so as to form a kind of large cable of the length required. Six of these are carried from one side of the river to the other, two of which are considerably higher than the other four. On the latter are laid sticks in a transverse direction, and over these branches of trees as a flooring; the former are fastened to the four which form the bridge, and by that means serve as rails for the security of the passenger, who would otherwise be in no small danger from the con-

tinual oscillation. The bujuco bridges in this country are only for men, the mules swim over the rivers; in order to which, when their loading is taken off, they are drove into the water near half a league above the bridge, that they may reach the opposite shore near it, the rapidity of the stream carrying them so great a distance. In the mean time, the Indians carry over the loading on their shoulders. On some rivers of Peru there are bujuco bridges so large, that droves of loaded mules pass over them; particularly the river Apurimac, which is the thoroughfare of all the commerce carried on between Lima, Cusco, La Plata, and other parts to the southward.

"Some rivers, instead of a bujuco bridge, are passed by means of a tarabita; as is the case with regard to that of Alchipichi. This machine serves not only to carry over persons and loads, but also the beasts themselves; the rapidity of the stream, and the monstrous stones continually rolling along it, rendering it impracticable for them to swim over.

"The tarabita is only a single rope made of bujuco, or thongs of an ox's hide, and consisting of several strands, and about six or eight inches in thickness. This rope is extended from one side of the river to the other, and fastened on each bank to strong posts. On one side is a kind of wheel, or winch, to straighten or slacken the tarabita to the degree required. From the tarabita hangs a kind of leathern hammock, capable of holding a man; and is suspended by a clue at each end. A rope is also fastened to either clue, and extended to each side of the river, for drawing the hammock to the side intended. A push, at its first setting off, sends it quickly to the other side.

"For carrying over the mules, two tarabitas are necessary, one for each side of the river, and the ropes are much thicker and slacken. On this rope is only one clue, which is of wood, and by which the beast is suspended, being secured with girths round the belly, neck, and legs. When this is performed, the creature is shoved off, and immediately landed on the opposite side. Such as are accustomed to be carried over in this manner never make the least motion, and even come of themselves to have the girths fastened round them; but it is with great difficulty they are at first brought to suffer the girths to be put round their bodies, and when they find themselves suspended, kick and fling, during their short passage, in a most terrible manner. The bridge of Alchipichi may well excite terror in a young traveller, being between thirty and forty fathoms from shore to shore; and its perpendicular height, above the surface of the water, twenty-five fathoms."

A third mode of bridge building is, by constructing piers of stone at a distance to be reached by single stones or beams of timber; if used in shallow streams, and composed of rough stones, laid without mortar, it is likewise a very simple operation, and such as would readily occur to a very rude people; but if the stream was at all times deep and rapid, and the piers composed of hewn stone laid with or even without mortar, the case was very different; workmen must have previously been accustomed to quarrying, hewing, and transporting large stones, also building them in a regular manner; working in metals, and preparing mortar, must have been known; and, from what will be detailed under

the head of Practice, it will be seen, that in preparing a proper foundation for each pier, the union and experience of various arts are required; and that the society, in which works of this sort, of any magnitude, were accomplished, was far advanced, and had the command of much well-regulated labour. The bridge over the Euphrates at Babylon, appears to have been constructed after this last manner; and there are many in different parts of China.*

With respect to the fourth mode, obtained by constructing arches of stone between the piers. If we may credit the accounts given by the Chinese, they constructed bridges in this manner, many centuries before arches were known to the inhabitants of the western world. Those connected with their inland navigation are numerous.

From the accounts generally given, it is not easy to form distinct ideas of the dimensions or construction of the Chinese bridges, or to what extent they merit the appellations bestowed by travellers, of being great and magnificent. Duhalde informs us, that "the stone bridges are commonly built like ours, on large piers of stone capable of resisting the rapidity of the stream, and sustaining the weight of the arches, wide enough for the passage of large vessels. They are exceedingly numerous, and the Emperor spares no expence when the public good requires them to be built.

"Of these, there is one very remarkable at Foutchcou-fou, capital of Tou-kien. The river over which it is built is half a league in breadth; it is sometimes divided into small arms, and sometimes separated by small islands; these are united in joining the islands by bridges, which make altogether eight furlongs or Chinese lys and 76 toises. The principal of these has alone above one hundred arches built of white stone, with bannisters on each side handsomely carved, upon which, at the distance of every ten feet, are placed square pilasters, whose bases are very large, resembling hollow barks.

"But that which excels all the rest is at Suentchcou-fou, built over the point of an arm of the sea, without which the passage would be sometimes dangerous, even in a boat. It is 2500 Chinese feet in length and 20 in breadth; it is supported by 252 strong piers, 126 on each side. All the stones are of the same bigness, as well those which are laid from pier to pier, as those which are laid crosswise, insomuch that it is difficult to comprehend how stones of such an enormous size should be placed in that regular manner, or even raised on the high piers on which they lie. After this, there is nothing of the kind worth mentioning."

The only conclusion to be drawn from the foregoing description of this work, which excels all the rest, is, that two rows of large stones or piers, (each row consisting of 126,) have been set up across the shallow mouth of a river or arm of the sea; that, along the top of these, other long stones have been laid horizontally, like wooden beams; and lastly, that long stones have been laid crosswise upon those longitudinal beams, in the manner of joists in carpentry, or more probably close together, composing a compacted bed or roadway. By dividing 2500, the total length in Chinese feet, by 127, the number of openings, it gives nearly 20

feet between centre and centre of the piers, so that after the thickness of the pier is taken away from the 20 feet, a moderate opening is left for the lintel to cover. The dimensions crosswise, correspond with the description as to the stones being of the same size, (at least as to length); for the breadth of the bridge is said to be 20 feet, and taking away the thickness of the two longitudinal beams, leaves the dimensions of the opening to be covered by the stones lying crosswise. It is therefore to the carrying from the quarry and raising stones of this magnitude, that the praise of ingenuity must be attributed; there being nothing else in the mode of construction which has a claim to refined science, or great progress in the mechanical arts. The danger to boats passing must, no doubt, have arisen from the shallowness of the water, and the frequency and violence of the surfs.

From the following relation, extracted from the same work, there is reason to expect correct information. It is entitled, "An account of the Journey of the Fathers Boures, Fontenay, Gorbillou Le Compte, and Vesdelore, from the port of Ning Po to Pekin, with a very exact and particular description of all the places through which they passed, in the provinces of Tche-kiang, Kiang-nan, Chan-tong, and Pe-tcheli.

"It is in this agreeable place that the city of Chao king has its situation. In the streets are a great number of canals, which give occasion for such a great number of bridges. They are very high, and have generally but one arch, which is so slightly built towards the top, that carriages never pass over them, which makes a great number of porters necessary. They pass over these bridges by a kind of stairs, of very easy ascent, and whose steps are not more than three inches in thickness. There are other sorts of bridges, made of stones 18 feet long, laid upon piles in the manner of planks. There are many of these over the great canal very handsomely built."

Again, "About four leagues from Hang-tcheou we crossed a village called Tan-si. It is built on both sides of the canal, on which are also two quays, about 400 or 500 geometrical paces in length. They are formed of the same freestone which lines the sides of the canal. There are stairs for the conveniency of every house, which are much better built, and more uniform than those in the city. In the midst of the village is a fine bridge of seven large arches; that in the middle is 45 French feet wide; the rest diminish in proportion to the descent of the bridge. There are two or three great bridges of one arch only.

"We crossed a great village or country town, called Ovan Kiang king, of large extent. One part communicates with the other by means of a bridge of three great arches, very curiously built: the middle arch is 45 French feet wide and 20 feet high."

Of these arches, which are here termed large and great, we find the span to be only 45 feet; an extent which, in Europe, would not be honoured with those appellations.

We have also heard of a bridge over a river named Laffrany in China, which joins two mountains together, said to be of one arch 600 feet span, and 750 feet in height; but having no distinct authority for this, and its

* In Fig. 1. of Plate LXXX. we have represented the probable steps by which the arch was invented.

being so very unlike to those described in Duhalde's work, we mention it merely as a matter deserving of more enquiry.

But it is of real importance to notice the description given by Mr Barrow of the mode in which some of the arches in China are constructed. "Each stone from five to ten feet in length, is cut so as to form the segment of the arch, and in such cases there is no key stone; ribs of wood fitted to the convexity of the arch, are bolted through the stones by iron bars fixed into the solid part of the bridge; sometimes they are without wood, and the curved stones are mortised into long transverse blocks of stone."

In Egypt and India, from whence the western world derived the rudiments of many sciences and arts, the construction of the arch was totally unknown; for the magnificent temples of the latter, and the splendid tombs of the former, were produced by cutting matter away in the manner of sculpture. There is no trace of the arch met with in the ancient works of Persia or Phœnicia; and even the Greeks, who created a school of architecture and sculpture, and carried it to the utmost degree of perfection of which it was capable, have a very doubtful claim to the knowledge of the arch. It is certain they never used it as an external feature of their temples, much less in the construction of bridges over rivers; and it has been observed, that the great Pericles, while he adorned the city of Athens with splendid edifices, never constructed a stone bridge over the small river Cephissus, although upon the most frequented road to that city. It is therefore to the Romans that the western world is indebted for this singularly useful application of architecture.

There is no certainty respecting the time when the Romans first used arches: If the Cloacae of Rome were really constructed in the time of the elder Tarquin, the use of arches must have then been well known; and from that prince's origin and connection, it is probable that they would be the labours of Tuscan workmen. It has been positively said by some, that the Romans received their knowledge of the arch from the Tuscans, who were at that time much farther advanced in the arts than their Italian neighbours. If this is admitted, the first knowledge of the arch is at least very intimately connected with Greece, the Tuscans being acknowledged as a colony of Dorians.

Whatever doubtful circumstances attend the claim to the invention of the arch, we know, from the best historical evidence, that the Romans first applied it to works of general use, as in forming aqueducts for conveying water to large cities, constructing bridges over rivers, vaulting magnificent temples, and in erecting monuments for recording the actions of their greatest heroes.

We at present consider only their bridges. At or adjacent to Rome, Gautier mentions eight bridges.

1. Pons Ælius, built by the Emperor Adrian, and named after him. It is said to have once had a cover of bronze supported by 42 columns. It is now called Sancto Angelo.

2. A triumphal bridge, the ruins of which are now seen in the Tiber. The emperors and consuls passed over this bridge when they were decreed a triumph.

3. Pons Janiculensis, now Ponto Sxtus, it having been rebuilt by Pope Sixtus IV. in 1475.

VOL. IV. PART II.

4. Pons Cestius, at present St Bartholomew. It was rebuilt by the Emperor Valentinian.

5. Pons Fabricius, now Ponto Caspi.

6. Pons Senatorius, at present Sancta Maria.

7. Pons Horatius, formerly Sublicius, built of stone by Horatius Cocles; rebuilt by Emilius Lepidus; the ruins are still seen in the Tiber.

8. Pons Milvius, which is about two miles out of Rome upon the Flaminian way.

Palladio gives a description of the bridge of Rimini, built by the Romans also upon the Flaminian way, which has five arches; likewise that of Vicenza upon the Bachliglione, of three arches; and of one upon the Rerone, of three arches.

And Martinellis mentions a bridge near Narni, on the road from Rome to Loretto, built by Augustus. It consisted of four arches, the first 75 feet span and 102 high: the spans of the others were 135, 114, and 142 feet. This appears to be the most magnificent bridge the Romans constructed in Italy.

In the provinces the Romans built many bridges, some very magnificent. We shall instance two in Spain, both in the province of Estremadura. That of Merida is upon the river Guadiana. Don Antonio Ponz, in his *Viage de España*, says he found its length 1300 paces; Vargas reckons 64 arches. In the time of Philip III. one of the large arches towards the middle was destroyed by an inundation, on which account three or four adjoining were rebuilt in 1610.

But perhaps the most magnificent of all the Roman bridges, and one of the noblest monuments of antiquity, is, the bridge of Alcantara upon the Tagus, at the town of that name. The town has probably taken its name from that structure, as the word *alcantara*, in the Arabic, signifies a bridge. It consists of six arches: its whole length is 670 Spanish feet, and from the bottom of the river to the road-way the height is 205 feet. For these Roman bridges, see Plate LXXXII.

Besides these ancient bridges which still exist, or are correctly described, we have accounts of many others; as that of Darius upon the Bosphorus of Thrace, Xerxes upon the Hellespont, Pyrrhus upon the Adriatic Gulf, Cæsar upon the Rhine, and Trajan upon the Danube; but these were constructed for the temporary purposes of war. The descriptions are vague, some of them improbable, and they belong more to military than civil architecture.

The ancient aqueducts, which were magnificent, will be described under the head of *INLAND Navigation*.

From the destruction of the Roman empire, to the establishment of modern Europe, it is in vain there to enquire for the progress, or expect the improvement of bridge building. In this, however, we ought to except the fine works of the Moors in Spain, particularly the bridge of Cordova over the Guadalquivir, built by Issim, the son and successor of Abdual Akman, the first of the Moorish kings of Spain.

When the arts began to revive in Europe, it was chiefly towards religious structures that power and influence were directed. One singular instance occurs of enthusiasm being directed to the useful purposes of improving the passages over rivers. Gautier, upon the authority of Magna Agricola of Aix, says, that upon the decline of the second, and commencement of the third race of kings, the state fell into anarchy; and that there

was no security for travellers, particularly in passing rivers, where violent exactions were made by banditti. To put a stop to these disorders, sundry persons formed themselves into fraternities, which became a religious order, under the title of Brothers of the Bridge. The object of this institution was to build bridges, establish ferry boats, and receive travellers in their hospitals on the shores of rivers. The first establishment was upon the Durance, at a dangerous place named Maupas; but in consequence of the accommodation arising from this establishment, the same place acquired the name of Bonpas. He relates further, that St Benezet, who proposed and directed the building of the bridge of Avignon, was a shepherd, and that he was not twelve years of age when repeated revelations from heaven commanded him to quit his flock and undertake this enterprize; that he arrived at Avignon just at the time the bishop was preaching to fortify the minds of the people against an eclipse of the sun, which was to happen the same day. Benezet raised his voice in the church, and said he was come to build a bridge. His proposition was accepted by the people with applause, but rejected with contempt by the magistrates, and by those who thought themselves wisest. As it was at that time an act of piety to build bridges, and Avignon being then a popular republic, the people prevailed, and every one contributed to the good work, some by money, and some by labour, all under the direction of Benezet, aided by the brothers. And he, by performing a great number of miracles, animated the zeal of every body. Upon the third pier was erected a chapel to St Nicholas, protector of those who navigate rivers. This was done after the death of Benezet, which happened in 1184. His tomb became celebrated for pilgrimages, where many miracles were performed. He had taken care to establish a conventual house, and a hospital, leaving the brothers to continue the work of the bridge.

This bridge, which was composed of 18 arches, was begun in 1176, and completed in 1188. In 1385, during the contentions of the popes, some of its arches were destroyed; three others fell in 1602, from the neglect of repairing a fallen arch. In 1670, the frost was so great, that the Rhone for several weeks bore the heaviest carriages: when the thaw followed, the ice destroyed the piers; but the third pier, with the chapel of St Nicholas, has stood notwithstanding all these accidents.

Our admirable bridge saint, not the least useful of that once numerous class of enthusiasts, in accomplishing, under such circumstances, so difficult, valuable, and magnificent a work as the bridge of Avignon, has perhaps quite as just a claim to the power of performing miracles as most of the saints of his day; and it is not improbable, that from the influence of his tomb, and that of his mantle upon the surviving brethren, that the still greater bridges of Lyons of 20 arches, and St Esprit of 19, were accomplished. Parts of the elevation of those bridges are given in Plate LXXXIII.

Perronet states, that in 1354 an arch of 150 French feet, or 160 English feet span, was built at Verona; and in 1454, one of 172 French feet, or 183.8 English span, and 66 French feet, or 70.6 English of rise from the springing, at Vielle-Brioude upon the river Allier in France. The last mentioned is the greatest span we know of for a stone arch.

In Italy there are many fine bridges. The peculiar situation of Venice has required a number far beyond what is to be found in any other city. The finest is the Rialto of 98½ feet span, and 23 feet rise. It was designed by the celebrated Michael Angelo, and erected between 1588 and 1591. Gautier states, that the numbers in the different quarters of the city are as follows, viz.

In the quarter of St Paul . . .	37
La Croix . . .	35
Canal Regio . . .	75
Arsenal . . .	72
Isle du Juifs . . .	9
Derso Duro . . .	67
St Marc . . .	44

339

In France, during the two last centuries, many fine bridges have been erected. The Pont Royal over the Seine at Paris, in 1685, from a design of Mansard. It consists of five arches. The centre one 77 French, or 82.3 English feet span; the breadth, including parapets, 56 French, or 59.9 English feet. The bridge at Blois, built from a design of the Sieur Gabriel, consists of 11 arches; the centre one 86 French, or 91.10 English feet span; the breadth over the parapets, 50 French, or 53.5 English feet.

Perronet gives plans and descriptions of sundry large bridges in France, constructed between the years 1750 and 1772.

The first in point of time and magnitude is the new bridge upon the Loire, at Orleans. The ancient bridge, which consisted of 19 arches, was in so bad a state, that it was found necessary to construct a new one; for which a design, made by M. Hupeau, then first engineer of bridges, was preferred; and by that time such was the progress made in bridge building, that, instead of 19 arches, as in the old edifice, this new design consisted of only nine. The middle arch is 100 French, or 106.9 English feet span, and the rise or versed sine 28 French, or 29.11 English feet. The arches next the abutments are 92 French, or 98.3 English feet span, and rise 25 French, or 26.8 English feet: the others are in proportion. The breadth, including the parapets, 46 French, or 49.2 English feet. It was begun in 1750, and opened to the public in 1760. Nothing can exceed the simplicity and elegance of this bridge, as will appear by the elevation, one half of which is given in Plate LXXXIV.

Of the same beautiful simplicity of character is the design of the bridge upon the river Seine, at Mantes. It consists of three arches: the middle arch is 120 feet French, or 128.2 English feet span, and rise 36 French, or 38.5 English feet; the two side arches are 108 French, or 115.4 English feet span, and rise 32 feet 6 inches French, or 34.9 English; the breadth, including the parapets, is 33 French, or 35.3 English feet. It was also designed by M. Hupeau; begun under his direction in 1757; and during that and 1758, raised to the level of the sixth course of arch stones: the work was then suspended on account of a war. It was recommenced in 1763 under the direction of Perronet, (M. Hupeau having died in that interval,) and was opened in 1765.

One of the finest of the French bridges, and the greatest work of Perronet, is that upon the Seine at

Neuilly. It consists of five arches, each 120 French, or 128.2 English feet span, and 30 French, or 32 English feet rise; the breadth including the parapets, is 45 French, or 48 English feet. It was begun in April 1768, and opened in October 1773; the masonry was completed in 1774; the roads, and other operations connected with this bridge, were finished in 1780. A great peculiarity in this bridge, well deserving the attention of engineers employed in similar works, is, that the soffits of the arches are shaped to suit the contracted vein of water, as formed in the entrance and exit of pipes. This is accomplished, by making the general form of the body of the arch elliptical, with a rise of 30 French, or 32 English feet, or $\frac{1}{4}$ of the span; but making the headers follow the segment of a circle, the versed sine of which is only $13\frac{1}{2}$ French, or 14.5 English feet, or about $\frac{1}{4}$ of the span. This, besides affording facility for the passage of flood waters, gives a great appearance of lightness to the whole fabric. The effect will be seen in the elevation, one half of which is given in Plate LXXXIV.

In the bridges at Orleans, Mantes, and Neuilly, we find the rise of the arches to be between $\frac{1}{4}$ and $\frac{1}{2}$ of the span; but rendered confident by success, and desirous of giving a variety to his works, Perronet, in the bridge over the Oise, at St Maxence, consisting of three arches, each 72 French, or 76.10 English feet span, makes the rise only 6 French, or 6.5 English feet, or $\frac{1}{12}$ part of the span; also, instead of making the piers each a solid, right lined on the sides, he divides each pier into two distinct parts, with an open space between them, and composes each part of two columns united by a piece of plain wall. The deviation from former works of a similar kind is here certainly sufficiently distinct; but the propriety of this measure will be discussed under the head of Practice. This bridge was begun in 1774; the operations were suspended in 1775; they were recommenced in 1780; and the centers were struck in 1785. See Plate LXXXV.

The bridge built upon one of the arms of the Loire at Saumur, from a design of M. de Voglio, and executed chiefly under the inspection of L. A. de Cessart, may also be classed amongst the first of the French bridges. It consists of 12 elliptical arches, each 60 feet span, and 21 of rise; the piers are 12 feet thick, and the breadth of the bridge, including the parapets, is 42 French, or 44.9 English feet. It was begun in 1756, and finished in 1770.

The progress of bridge-building in England seems to have kept pace with the same art on the continent. The very singular bridge at Croyland in Lincolnshire, is said to have been built in 860. This date is likely to be correct; for Croyland Abbey was founded in 716, and the Abbey of Rumsey, in Huntingdonshire, in 974. (Bentham's *Essays*.) This bridge has three distinct approaches, formed by three segments of a circle, which meeting in the middle, compose pointed arches, their bases or abutments standing upon the points of an equilateral triangle.

It is worthy of remark, that the bridge of Avignon was begun under the direction of Saint Benezet in 1176, and that of London begun to be built of stone under the direction of Peter of Colchester, a priest, in the same year (1176). The French "Brothers of the Bridge" accomplished their magnificent and useful work in 12 years, the labours of the English priest occupied 33 years; but this may be accounted for, by considering

the interruptions which must be experienced in a river, where the tide rises twice every day from 13 to 18 feet. We may further remark, that as the constructions of the bridges of St Esprit and Lyons immediately succeeded to that of Avignon, so the bridge at Newcastle-upon-Tyne was built of stone in 1281, and that over the Medway at Rochester, consisting of 11 arches, much about the same time.

In London bridge there are now 19 arches, and it is 45 feet in breadth. For many ages there were houses along each side of it; but these were removed, the middle pier was taken away, and the space, including the two adjacent arches, converted into one arch of 72 feet span, in 1758. The remaining old arches are very narrow, and the piers enormously large, being from 15 to 25 feet in thickness above the sterlings. The passage over the bridge is very commodious, but in other respects it is very inferior to the before mentioned old French bridges. See Plate LXXXIII.

Many other old English bridges might be described, which, in conformity with the turbulence of the times, were generally fortified with gateways. It would be curious to trace their history, and delineate their features; but as the limits of our present article will not admit of this, we shall pass on to those of modern times, from which our readers will derive more useful information.

In 1636, the English Palladio (Inigo Jones) gave a design for a bridge, which was erected at Llanwst in Denbighshire. It consists of 3 arches, segments of circles; the middle one is 58 feet span, and rises 17 feet, the piers are 10 feet thick, and the breadth of the soffit of the middle arch is 14 feet. The arch stones of the largest arch being only 18 inches deep, the covering over them being little, and the approaches very steep, the bridge has a very light appearance.

The bridge over the river Thames at Westminster, being not only the greatest work of the kind in England, but having, in what regards laying foundations in deep water, and constructing centres for large arches upon navigable rivers, formed a new school for bridge-building in this island, we shall give a detailed account of it.

From reports made by Mr Labalye, (1751) it appears, that from 1734 to 1738, the time was employed in obtaining acts of parliament, and determining the precise situation and plan of this great work. In 1738, the situation was finally determined to be a little way below New Palace Yard; the model made by M. Labalye was approved of, and he was appointed engineer. The intention at this time was to construct the piers of stone, and place a wooden superstructure upon them. This latter part was designed by Mr James King, who contracted to complete it in 12 months after the piers were finished for 28,000*l*.

It was not till after many explanations and discussions, that Mr Labalye satisfied the commissioners, appointed by parliament, of the facility, economy, and security to be derived from laying the foundations of the piers in caissons or chests, instead of placing them upon piles in the ancient manner, cut off about the level of low water; or using batterdeaux or cofferdams, formed around the foundations, and pumping the water from the inside, as had been performed in more modern times. This beautifully simple mode was, however, adopted, and the first stone of this great fabric was laid by the Earl of Pembroke on the 29th January 1739. During

the same year, the commissioners directed Mr Labalye to prepare a design for a superstructure of stone, which he did, and it was approved of and adopted on the 31st January 1740: A liberal arrangement having been made with Mr King respecting his contract for the wooden superstructure, he immediately designed, for the stone arches, those excellent centres, which have ever since served as a model for works of a similar kind in England.

The works were carried on with great dispatch and success; the centre of the last arch was struck on the 25th July 1747, and, on the 14th November, the roads and streets were finished. A circumstance, however, took place, which prevented the bridge from being, at that time, opened to the public. The workmen employed to get gravel out of the bed of the river to cover the roadway of the bridge, finding some very suitable near the third pier, on the western side of the centre arch, they excavated considerably lower than the foundation, and too near it; the gravel then run from under the platform, and the pier sunk so much as to render it necessary to take down the two arches which rested upon it. The securing the foundation, rebuilding the pier and two arches, and replacing the parapets, pavements, and roadway, was completed, and the bridge opened to the public on the 18th Nov. 1750. This bridge consists of 13 large and two small arches; their forms are semicircular; the middle one is 76 feet span, and the breadth over the parapets 44 feet. See Plate LXXXVI.

About 10 years after the completion of Westminster bridge, another was begun to be erected between it and London bridge, now well known by the name of Blackfriars. The design was made by Robert Mylne. It consists of nine arches of an elliptical form; the middle one is 100 feet span, and the breadth across the bridge is 43 feet 6 inches. Mr Mylne benefited by the example of Labalye, and built the piers in caissons; but probably alarmed by the sinking of one of the piers at Westminster, he drove piles in the spaces upon which the bottoms of the caissons are placed. His arches being of wider span and of an elliptical form, his piers of proportionally less thickness, and having less masonry over the top of the arches, this bridge has a much lighter appearance than that of Westminster. It has been doubted, whether the slender detached Ionic columns are a proper accompaniment to such a work, and whether the divisions of the lengths of the rusticated headers of the arches are any improvement. His centres are evidently a copy of those used at Westminster.

The general style of this bridge bespeaks a mind emboldened by the success of his predecessor, to advance, though very cautiously, a step further in the practice of bridge-building. It is a work of great merit, and will not suffer by a comparison with any other constructed in the same age. It was begun in 1760, and completed in 10 $\frac{1}{2}$ years. See Plate LXXXVI.

At the same time that this noble work was carrying on at Blackfriars, a very fine bridge was constructing upon the river Tay, at the town of Perth in Scotland. It consists of nine arches; the middle one is 77 feet span, the width across is 26 feet, and the total length is 906 feet. It was designed and executed under the direction of Mr Smeaton, between 1760 and 1771. About the same time, and under the direction of the same gentleman, a bridge of no inconsiderable magni-

tude was built over the river Tweed at Coldstream, consisting of 5 arches, the middle one being 64 feet span; and also a bridge of seven arches over the river North Esk, near Montrose.

Previous to forming the plan of that magnificent extension of the city of Edinburgh, known by the name of the New Town, it was necessary to form a commodious communication with the central part of the High Street of the Old Town. This was accomplished by constructing a bridge over the deep valley called the North Loch. This bridge consists of three arches, each about 72 feet span, and two small arches each 20 feet span; the height from the present surface of the ground to the springing of the arches on the piers, is 17ft. 6in.; the arches being semicircular, rise 36 feet, the archstones are 2ft. 9in., and from the top of the archstones to the top of the parapets, is 9ft. 9in., making the whole height, from the surface of the ground to the top of the parapet over the middle arch, 65 feet; the breadth across the soffit of the arches is 42ft. 3in. From the arches to the banks on each side of the valley, the spaces are occupied by coach houses, stables, &c. formed under the roadway. The outline of the cornice and parapet, contrary to usual practice, is a curved line, bending downwards. This, in viewing the elevation, gives the appearance of the middle part of the bridge having sunk. Excepting the arches, which are fine and well executed, no part of the design claims much commendation; and we cannot help regretting, that the architect Mr Mylne, has failed in rendering this structure a suitable feature to the singularly fine situation which it occupies.

Several excellent stone bridges have lately been constructed upon the river Thames at Kew, Maidenhead, Henley, and Oxford; and not inferior to these are the bridges over the river Severn in Worcestershire and Shropshire. Five of these were designed and executed under the direction of Mr Gwynn, a native of Shrewsbury, and two by our countryman Mr Telford, the engineer.

The centre arch of the bridge in Blenheim Park, is 101ft. 6in. span.

In 1762, a single arch was built upon the river Tees, at Winstone in Yorkshire, from a design of Sir Thomas Robinson, the span of which is 108 feet 9 inches.

A very fine bridge has been lately erected at Ferry Bridge, in the same county, upon the river Ouse: it consists of three arches, the centre one 65 feet span, the width within the parapets 28 feet 6 inches.

In South Wales, the bridge over the river Taaf, near Llantrissart, in Glamorganshire, is justly celebrated, both on account of its great span, and the singular circumstances which attended its construction. In 1746, William Edwards, a country mason, undertook to build a bridge at that place. He built one of three arches, and it was allowed to be well executed; but, being in a mountainous district, the torrents sometimes rise hastily to a height which must appear incredible to the inhabitants of flat countries. One instance of this sort happened after this bridge had stood about two years and a half, when the torrent carried along with it trees, brushwood, hay, and whatever of this kind lay in its way: these were entangled in the arches, and, causing the water suddenly to create a great head, the bridge was swept away. As William Edwards had given security to maintain the bridge for seven years, he immediately set about

rebuilding it; but, in order to avoid future injuries from similar torrents, he constructed one arch, the segment of a circle of which the chord line was 140 feet, and the versed sine 35 feet. The arch was finished, but had not received the parapets, when the weight pressed in the haunches, raised up the crown, and destroyed the arch. This was in 1751. But William Edwards, possessed of an uncommon degree of fortitude, resolved to rebuild the arch of the same dimensions; and it appears he took his measures prudently; for we have been informed, by that excellent and respectable engineer Mr Jessop, who was then a clerk with Mr Smeaton, that Mr Edwards consulted that eminent man with respect to rebuilding this large arch. Mr Jessop does not recollect the advice which Mr Smeaton gave, but the bridge was rebuilt in 1755; the chord line and versed sine are the same as before, and the width across is eleven feet: in each haunch or spandrel there are three cylindrical arches quite across the bridge; the lowest is nine feet, the middle six feet, and the uppermost three feet diameter. These, to avoid weight, are of course left hollow; and Mr Evans, a native of Wales, who was afterwards chief engineer to the Royal Canal in Ireland, informed Mr Jessop, that, in addition to the cylinders being left hollow, the spaces between them were filled up with charcoal. From the steepness of the ascent on each side, and the narrowness across, this bridge is more remarkable as an effort of art than for the accommodation it affords.

Of late years, the building of bridges has been carried to a very great extent in Scotland. Upon the river Teviot, immediately above its junction with the Tweed, a very handsome stone bridge of three arches has been constructed from a design, and under the direction of Mr Elliot, an architect resident in Kelso. The middle arch is 65 feet span, and rises 17 feet; the arches are segments of circles, and the width over the parapets is 23 feet. There are coupled columns over the piers, which are quite insulated; and the points of the piers are in the shape of Gothic arches. It was begun in 1794, and finished in 1795. About 4 years after the completion of this bridge, another very elegant one was constructed at Kelso, from a design of Mr Rennie, an eminent engineer. It is situated immediately below the confluence of the Teviot with the Tweed. It consists of 5 arches, each of 73 feet span, and 21 feet rise; they are of an elliptical form, and the road over them is level. Over each pier, and upon each abutment, are two small columns, and an entablature runs along the whole of the bridge. The columns are not insulated, being 3 columns only; the points of the piers are semicircular; the width over the parapets 26 feet. It was begun in 1799, and finished in 1803. The characters of those two bridges being rather gentle than bold, accord well with the beautiful scenery of the adjacent banks of those two fine rivers.

On the road from Berwick to Edinburgh, the Peas bridge erected over a deep dingle, is a bold work. It consists of four arches; the largest span is 55 feet, and the height of the bridge is 124 feet. The architect was Mr David Henderson of Edinburgh.

A large arch has been built at Aberdeen also over a dingle, through which there runs a small rill called the Den Burn; it forms a part of an improved approach to the city from the southwards. The magistrates had, in the year 1801, begun to construct a bridge of three small arches, and had laid the foundations of the abutments and piers

for that purpose, under the direction of their then superintendant of city works, Mr Fletcher, when Mr Telford the engineer passing that way on the service of government, was desired by the magistrates to examine their intended bridge. On considering the excellent granite stone which was used, he prevailed with them to abandon the scheme of having three arches. At their desire he gave a plan of one arch of 150 feet span, being larger than any stone arch in Britain, and otherwise containing many singular features calculated to prove what could be performed with Aberdeen granite. But however desirous the magistrates were to exhibit the excellency of their favourite material, the expense of this plan much exceeded their funds. Mr Telford afterwards made a simpler design; but in order to save some masonry of the abutments which had already been executed, they got their inspector of the city works to reduce the span to 130 feet, of which dimensions it has been executed. The rise is 29 feet, and breadth across the soffit 43 feet. It is still a magnificent arch, though of smaller span than that of Mr Edwards over the Taaf. The difficulty attending the construction of a large arch here, was much lessened by its being placed on dry land.

A much more arduous task has been accomplished upon the river Dee, at Tongueland, near Kirkcudbright, where there is about 10 feet of water in the lowest state of the river, above which the ordinary spring tides rise 16 feet, and where of course, for a large arch, a trussed centre was required. The design was given by Mr Telford; it is 118 feet span, and the rise or versed sine 38 feet. The spaces between the large arch and the rocky banks upon which it abuts, instead of being filled by earthen embankments, are occupied by small arches raised upon slender piers. The whole has a bold effect, especially during the flux and reflux of a high spring tide immediately under the bridge, when agitated by a strong westerly wind, and accompanied by a great land flood, tumbling down a rocky channel at some distance above it. See Plate LXXXVII.

A large bridge has been lately built over the river Spey, near Gordon castle, at Fochabers. It consists of four arches; the two middle ones are each 95 feet span, and the breadth over the parapets is 21 feet 6 inches. There being an even number of arches, a pier is brought into the middle of the river, and the architecture of the facade is feeble; still the structure does credit to the architect and builder, Mr G. Burn.

The finest bridge in Scotland is that which has just been built by the duke of Athol, over the river Tay, at Dunkeld. There are five large arches and two smaller land arches; the middle arch is 90 feet span, and rises 30 feet, the width over the parapets is 27 feet 6 inches. The facade has castellated turrets over the piers and abutments; the outlines of the parapets and roadway is a curve only sufficient to carry off the water; the approaches to the bridge, the duke has rendered very complete; and the whole forms a feature, suitable to the magnificent scenery which surrounds Dunkeld. The design for this bridge was made by Mr Telford. It was executed under his directions, and finished in 1809.

From the foregoing statements, it is evident that the progress of bridge building in Britain has of late years been great; but the effects, though considerable, have been distant and unconnected. Perhaps, however, the greatest and most regular scheme for opening the

general intercourse through a great extent of country, that has ever been voluntarily undertaken by a free people, was that which originated in 1802. Previous to this, the northern districts of Scotland, although in sundry parts intersected by military roads, were very imperfectly opened; for these had been hastily constructed, and frequently ill fitted for the purposes of civil life.

In order, therefore, to encourage the spirit of improvement which had strongly manifested itself in the northern parts of the island, a board of parliamentary commissioners was established, viz.

The Right Honourable the Speaker of the House of Commons,

The Right Honourable the Chancellor of the Exchequer,

His Majesty's Advocate for Scotland,

The Right Honourable William Dundas,

Sir William Pulteney, Bart,

Isaac Hawkins Browne, Esq.

Nicholas Vansittart, Esq.

Charles Grant, Esq.

William Smith, Esq.

Charles Dundas, Esq.

John Rickman, Esq. Secretary,

James Hope, Esq. Commissioner and Law Agent in Scotland,

Thomas Telford, Engineer to the Board.

This Board, upon the application of individuals, or bodies of men, pointing out communications in the Highlands of Scotland, of public utility, and undertaking to defray a moiety of the expense, causes surveys and estimates to be made, and, if found to be truly useful, advances the other moiety from the public funds. In consequence of this, about sixty different roads have been surveyed, and a great proportion have either been already completed, or are now (1812) in a state of forwardness. Upon these roads there are bridges of different sizes, to the number of 1486, and several of no inconsiderable magnitude, viz.

Bonar bridge, of cast iron, 150 feet span, over an arm of the sea.

Dunkeld bridge, of 7 arches, viz. one of 90, two 84, two 74, two 22 feet.

Conon bridge, of 5 arches, viz. one 65, two 55, two 45 feet.

Ballater bridge, of 5 arches, viz. one of 60, two 55, two 34 feet.

Lovat bridge, of 5 arches, viz. one of 60, two 50, two 40 feet.

Wick bridge, of 3 arches, viz. one of 60, two 48 feet.

Alford bridge, of 3 arches, viz. one of 48, two 60 feet.

Potarch bridge, of 3 arches, viz. one of 70, two 45 feet.

Besides these, there are upwards of 60 bridges of one arch each, from 30 to 60 feet span.

In Ireland, the city of Dublin has several fine stone bridges over the river Liffey, the principal of which are, 1. Queen's bridge, built upon the site of Arran bridge, which had been erected in 1684, and destroyed in 1763. It was designed by Colonel Vallency, and was finished in 1768. It consists of three arches; the middle 46 feet span, the others 35 feet each; the piers

are 7 feet thick, and the breadth between the parapets is 35 feet. 2. Essex bridge, which was originally founded in 1676, by Sir Humphrey Jarvis, in the viceroyalty of Arthur earl of Essex; it being decayed, was taken down and rebuilt in 1753, from a design and under the direction of Mr George Semple, who published a very full account of the proceedings. It consists of five arches, one 58 feet span, three of 45, and one of 37 feet; the thickness of the piers on each side of the centre arch is 6 feet, the breadth between the parapets 48 feet. 3. Sarah's bridge, consisting of an arch of 110 feet span, with a rise of 22 feet; the breadth between the iron railing 37 feet. This was built by Mr Stevens, an experienced bridge builder from near Edinburgh, in the year 1792. 4. Since that time Carlisle bridge has been rebuilt; it consists of three arches, the middle 50 feet span, the others 40 feet each; the thickness of the piers 10 feet, breadth between the parapets 63 feet.

There is also a very fine stone bridge over the river Lee, at Cork, built within these few years, with a draw bridge for ships at the north end of it.

TIMBER BRIDGES.

This historical sketch respecting bridges, has hitherto been confined to those constructed of stone, but other materials have been successfully employed. Bridges of great extent have been constructed of wood.

With the exception of drawings made by Palladio and others, from the descriptions given in Cæsar's Commentaries, of his bridge over the Rhine, we have no satisfactory account of any ancient wooden bridge. Of those of more modern times, there is one described by Palladio, said to be situated upon the Cismone, at the foot of the Alps, between Trente and Bassane in Italy. It is of very simple construction; the whole being suspended by the framing, which forms the sides; the opening between the abutments is 109 feet. Palladio also gives sundry designs for wooden bridges formed in different ways, some of which are supported by the sides only; and one is in the form of an arch. See Plate LXXXVIII. Gautier gives designs of his own, and one from Mathourin Jousse; the last mentioned consists of one passage over it for cavalry, and another for infantry, and is protected by a roof. But the boldest and most ingeniously constructed wooden bridge on the European continent, was that at Schaffhausen, in Switzerland.

We are informed that there was formerly a stone bridge at Schaffhausen, that the Rhine injured the piers, and that in the year 1754 three arches fell; that the depth of water immediately on the upper side of the old piers being, during summer, from 18 to 20 feet, and from 28 to 30 feet below them, the idea of rebuilding a stone bridge was abandoned, and that the old piers, excepting one near the middle, were taken away; that Ulric Grubenman, a common carpenter of Tüfien, produced a model for a wooden bridge, supported only by the abutments on the banks of the river; that after some hesitation on the part of the committee of Schaffhausen, his proposal was adopted, and that he completed this truly extraordinary work in the year 1758. The total length of the bridge was 364 feet, and its breadth

18 feet. It was eight feet out of a straight line, and the angle pointed down the river; the distance from the abutment next the town to the angle was 171 feet, and from the angle to the opposite shore 193 feet. This magnificent and ingenious bridge was destroyed by the French in April 1799. See Plates LXXXIX. and XC.

About the same time that Ulric Grubenman was engaged at Schaffhausen, his brother John constructed a bridge of the same kind at Ruichenau, 240 feet in length; and some years afterwards they jointly erected one near Baden, 200 feet in length, over the river Limmat.

We know of no wooden bridges in Europe of an extent equal to those constructed by the beforementioned ingenious men. But one upon nearly the same principles, and of 250 feet span, has been constructed over the Portsmouth river in North America, by a Mr Bludget. Yet, though of inferior magnitude, several upon principles equally simple and effective, have been erected upon rivers in Scotland by James Burn, of Haddington, in East Lothian. The largest is over the river Don, about seven miles from the city of Aberdeen, upon the road which leads from that place to Banff; the extent between the abutments is 109 feet 3 inches, and the breadth 18 feet. The frames which support the roadway are composed of short pieces of timber, but instead of being elevated above the level of the roadway in order that it may be suspended from them, they here support it after the manner of stone voussoirs. This bridge was erected in 1803. See Plate LXXXVIII.

There is an elegant wooden bridge in the park at Wotton, a seat of the Marquis of Buckingham, constructed precisely upon the principle of one given by Palladio. The span of it is 87 feet, the versed sine 13, and the breadth across 20 feet.

Small timber bridges, being, in all countries abounding in wood, so obvious a means for crossing streams, it is impossible to trace their origin and progress; and those consisting of rows of piles driven into the bed of a river, and supported by common trussings and bracings, being found in most countries, and being familiar to every body, it is only necessary, in what regards them, to refer to the Plates, and to what is said under the head of Practice.

IRON BRIDGES.

In Britain, of late years, the application of iron having been greatly extended, and practical mechanics having been also brought to much perfection, that valuable metal has been used in the construction of large arches over rivers.

The first cast iron bridge was erected upon the river Severn, about two miles below Coalbrook Dale, and between the villages of Madely and Broseley, in the county of Salop. The form of the ribs or intrados is nearly semicircular, the span being 100 feet 6 inches, and the rise from the level of the springing plates to the soffit at the middle is 45 feet, the height from the ordinary low water to the springing plate is about 10 feet, making the whole height from the low water to the soffit 55 feet. This bridge was constructed by Abraham Darby; it was cast at the Coalbrook Dale foundries, and erected in 1777. The design was bold and well executed; it formed a new æra in bridge build-

ing. The banks of the river adjacent to the bridge are exceedingly high and steep, and composed of alluvial matter which slips over the points of the coal strata. The effect of this operation not having been sufficiently provided against, some years ago, the top part of one of the stone abutments was pressed in a few inches, and of course raised up the iron work about the middle of the arch. Steps have been since taken to secure the western abutment; but the other, by having valuable houses built close up to it, is more entangled, and it may in time suffer from that cause; but the iron work has not been the least affected by the weather, or the intercourse over or under the bridge during 34 years. See Plate XCI.

The next cast iron bridge in point of time, was likewise erected upon the river Severn, about three miles above the former, at the expence of the county of Salop. Here the banks being low, Mr Telford, as county surveyor, under whose direction it was built, introduced the principle of suspending the roadway by two large ribs, one on each side of the bridge. The span is 130 feet, the versed sine of the ribs which bear the covering plates is 17 feet, the breadth across the soffit is 18 feet, and the height from ordinary low water to the soffit is 34 feet. The Coalbrook Dale Company performed both the masonry and iron work by contract, and it was finished in 1796. The eastern bank of the river is composed of matter similar to that which injured the abutments of the former bridge; but here, the foundations being placed upon rock, and the masonry made of a wedge form behind, the whole has continued perfect during 15 years. See Plate XCI.

The third iron bridge, in regard to time and progressive increase of magnitude, is that erected upon the river Wear, at Sunderland, in the county of Durham. It is likewise the segment of a circle, the chord line being 236 feet, and the versed sine 34 feet: the height from the surface of ordinary low water to the soffit is 100 feet. The merit of having this bridge, instead of the ferry over the river, is chiefly due to Rowland Burdon, Esq. The iron work was cast at the foundries of Messrs Walkers, at Rotherham, in Yorkshire, and was erected under the direction of Mr Thomas Wilson. It was opened for general use in August 1796, and forms a magnificent feature and a very convenient passage in that part of the country. See Plates XCI. XCIII.

The progress of this new species of bridge building was bold and rapid, setting out from a point, which arches constructed with stone seldom reached, that is to say, 100 feet span, extending next to 130, and from thence to 236 feet. Former experience was left far behind, and a principle introduced, to the practical operation of which we can at present assign no limit; since a design still bolder than any of the foregoing was projected, when a proposition was made by a committee of the House of Commons, for rebuilding London bridge. Mr Telford presented a plan of one arch of cast iron, the chord of which was 600 feet, and the versed sine 65 feet. This plan met with the approbation of the committee, and was by them submitted to the investigation of twenty persons, most eminent in Britain for scientific knowledge or practical skill. Their reports justified its being adopted; but a rapid succession of political events, have hitherto prevented it from being carried into effect.

Two very neat cast iron bridges, each consisting of one arch of 100 feet, have been built over the river Avon, at Bristol, under the direction of Mr Jessop, the engineer; and one, 150 feet span, has been designed by, and is now building under the direction of, Mr Telford, over an arm of the sea, upon one of the High-

land roads, in the county of Sutherland. See Plate XCIV.

An iron bridge 85 feet span, has been built over the river Witham, at Boston, in Lincolnshire, designed by Mr Rennie. See Plate XCIV. (7)

PART I. THEORY OF BRIDGES.

THE construction of a magnificent stone bridge is justly looked upon as one of the greatest performances of the masonic art: for if we compare the enormous weight of a great arch, with the strength which the cohesion of the firmest cement can give, we readily admit, that it is only by the nicest adjustment and balancing of its parts, that they are hindered from instantly falling to pieces.

Though there can be little doubt that the Romans and latter Greeks had paid some attention to this subject, from the beautiful specimens of their architecture, which exist even in our times; yet in none of their authors, either practical or scientific, is the smallest light afforded us respecting the principles upon which their practice was regulated.

The architects of the middle ages, who constructed those great cathedrals that are still the ornament of the chief cities in Europe, and the delight of the architectural antiquary, seem to have fondly indulged in the balancing of arches. They were without doubt directed by maxims, which had been elicited from a varied and extensive practice; but, whatever these were, they are to us unknown. None of these architects, though many of them were men of learning, seem ever to have committed to writing, either the history of any such erection, or the principles by which its construction was regulated. Nay, this knowledge seems rather to have been carefully kept secret, and regarded as a sort of mystery; a craft, which was only to be communicated to the *brethren*, whose experience and skill had already qualified them to be initiated into the mysteries of the sublime degree.

It does not appear, that a knowledge of this subject could be acquired otherwise than by experience. The mathematical sciences were then little known; and we may see from the construction of the bridges of that age, that the priests, who were the only architects, have had in their eye rather the successive vaulting of a Gothic cathedral, than to have originally considered of the best way of forming a permanent and convenient road. It was only about a century ago, when Newton had opened the path of true mechanical science, that the construction of arches attracted the attention of mathematicians. Since that time, volumes have been written respecting the equilibrium of arches. It has been found one of the most delicate, as it is one of the most important applications of mathematical science. Yet, with all due deference to the eminent men who have prosecuted this subject, we are much inclined to doubt whether the greater part of their speculations have been of any value to the practical bridge builder. He is still left to be guided by a set of maxims derived from long experience, and as yet little improved by theory. In truth, his works seldom fail even where they differ farthest from the deductions of the theorist; and at all

events, he finds that a much greater latitude is allowable than theory seems to warrant. He is therefore surely excusable in doubting of the justice of such theories, at least until they are more consonant to the approved practice.

It is our intention, in the present article, to point out a new mode of considering this subject, to which, with great diffidence, we request the attention of the intelligent practitioner. It may indeed still be deficient, if not in some respects erroneous. But it will, we think, have this merit, that of being readily apprehended, and easily applied, without requiring much previous scientific information. Indeed though we highly value the sublime geometry, we are inclined to think that the unnecessary parade of calculus in the application of science to the arts, has been one of the chief causes of the dislike, which many able practical men of our country have shown to analytical investigation.

Nevertheless, as many of our readers are well qualified to comprehend, and will naturally expect that we should point out, the modes of investigation, usually pursued in this interesting subject; we shall previously, and in as succinct a manner as possible, endeavour to lay before them the commonly received theory of equilibration. From which, having cleared away the useless rubbish, if we can extract any proper materials, we may, like economical builders, make good use of them in our future structure.

The first thing like a principle that we meet with is in the assertion of the eminent Dr Hooke, that the figure into which a heavy chain or rope arranges itself, when suspended at the two extremities, being the curve commonly called the *catenaria*, is, when inverted, the proper form for an arch; the stones of which are all of equal size and weight.

Now, as this idea, strictly just, has been very generally adopted, and affords some useful hints, it may be well worth while to examine it. Let A, B, Plate LXXX, Fig. 2, be a string or festoon of heavy bodies, hanging by the points A, B, and so connected, that they cannot separate although flexible. These bodies having arranged themselves in the *catenaria* ACB, conceive this to be turned exactly upside down. The bodies A and B being firmly fixed, then each body in the arch ADB, being acted on by gravity, and the push of its two neighbours with forces exactly equal and opposite to the former, must still retain its relative position, and the whole will form an arch of equilibration.

This arch, however, would support only itself; nay, a mere breath will derange it, and the whole will fall down. But if we suppose each spherule to be altered into a cubical form, occupying all the space between the dotted lines, the stability will be more considerable. And as the thrust from each spherule to its neighbour is in a direction parallel to the tangent of the arch at the

point of junction, it is obvious, that the joints of our cubical pieces must be perpendicular to that, so as to prevent any possibility of sliding.

Our arch is now composed of a series of truncated wedges, arranged in the curve of the *catenaria*, which passes through their centres; and we are disposed, with David Gregory, to infer, that when other arches are supported, it is only because in their thickness some *catenaria* is included.

We might pursue this subject a great deal farther, by investigating all the useful properties of the *catenarian* curve: but, in our opinion, this is at present unnecessary. This curve is, indeed, the only one proper for an arch consisting of stones of an equal weight, and touching in single points, but is not at all adapted to the arch of a bridge, which, independent of the varying loads that pass over it, must be filled up at the haunches, so as to form a convenient roadway. In this case, some farther modification becomes necessary. The *haunch* E of the arch ACB, (Plate LXXX, Fig. 3,) bearing a much greater depth of stuff than the crown, it must be so contrived as to resist this additional pressure. Every variation of the line FGH, or *extrados*, will require a new modification of the curve ACB, or *intrados*, and the contrary. Accordingly, M. de la Hire has suggested a good popular mode of investigating this subject. Let it be required to determine the form of an arch of the span AB, and height CD, proper for carrying a roadway of the form FGH. Mark off, upon a vertical wall, the points A, B, C', inverting the required figure: Suspend from A, B, a uniform chain or rope, so that its middle may hang a little below the point C', and dividing the span AB into any number of equal parts, and drawing the perpendiculars *ab*, *cd*, &c. suspend from the intersections *e*, *f*, bits of chain *eb*, *fd*, &c. so trimmed, that their ends may fall on the line of roadway; and it may be observed, that as those pieces, which hang near the haunch, will bring it down, the crown C will thereby be raised into its proper position.

All will now do, provided that the sum of the small pieces of chain has to the large one, AC'B, the same ratio which the stuff to be filled into the haunches has to the whole weight of the archstones; the depth of which must of course be previously determined. But, if this is not the case, it will be easy to calculate how much must be added to, or subtracted from, the small chains, in order to obtain this proportion. This being equally divided among the small chains, will give a roadway very nearly parallel to the former. The curve will evidently be a perfect curve of equilibration, and extremely near the one wanted. And this whole process is so easy, that it may be gone through in a short time by any intelligent mason.

But although this mechanical way of forming an equilibrated arch be founded upon principles sufficiently just, and be perhaps the simplest and best way in which the practical builder could form the original design of such an arch, yet as it affords no general rules that may be applied to the construction of arches, we proceed to consider the same subject in a mathematical point of view.

And first, then, in the semicircular polygon, as it is called, Fig. 4, where weights are hung on the thread AC'CB, which bring it into the position ACB, we have at each angle three forces in equilibrio. Wherefore, by the principles of statics, they are to one another

VOL. IV. PART II.

as the sines of the opposite angles; that is, the tension rC is to the tension lC , as sine lCW is to sine rCW , but the tension from C to l is the same as from C' to r . Also sine lCW is the same as sine $r'CW'$, since these angles are supplementary, CW , $C'W'$ being parallel; therefore the tension rC is to the tension $r'C$, as sine $r'CW'$ to sine rCW . Or, the tension in each part of the chord is inversely as the sine of its inclination to the vertical.

Again, we have as $\sin. dCl : \sin rCl :: \text{tension } rC : \text{tension } dC = \frac{rC \times \sin. rCl}{\sin. dCl}$; but as rC is inversely as $\sin. rCl$, therefore tension dC is as $\frac{\sin. rCl}{\sin. rcd \times \sin. dCl}$.

Now, let there be an unlimited number of weights hung from the chord, and indefinitely near each other, our polygonal thread becomes a curve, Fig. 5, being in fact the curve of equilibration adapted to the weight which depends from it. The angles rCd and lCd become $r'Cd$ and $l'Cd$, which are supplementary, and have equal sines, wherefore the product of these sines is the square of either. Also, as the sine of rCl or rCr is as the curvature, or reciprocally as the radius of curvature, we have tension dC , or weight on C , inversely as $\text{rad. curv.} \times \sin.^2$ inclination to vertical.

This tension, in the present case, is usually produced by the gravity of the superincumbent materials, and may be measured by the area contained between two indefinitely near vertical lines, EF , ef , Fig. 5; but while the distance Ee is constant, the area fec will diminish with the sine of EF , as Ee becomes more upright. To countervail this, we must enlarge the depth EF in the same proportion as sine ec diminishes. And, therefore, we have EF inversely as $\text{rad. curv.} \times \sin.^3 ec$. That is, the height of the superincumbent matter must be inversely as the radius of curvature, into the cube of the sine of the inclination of the curve to the vertical.

This, then, is the leading principle of the commonly received theory of equilibration. The mode in which we have derived it is concise, but we trust it will not be found the less clear, or the less easily apprehended.

Let us proceed to apply the theory to some practical cases.

If the arch be the segment of a circle, then the radius of curvature is the same throughout, and the height will be inversely as the cube of the sine of inclination to the vertical. And from this we derive the following very simple construction, for describing the equilibrating extrados of a circular arch, and which the reader, who has examined this subject, will find much easier than those commonly given.

At any point D , draw the vertical Dd , and DF from the centre C ; Fig. 6. then laying off Da equal to the thickness at the crown, draw the perpendiculars ab , bc , cd successively, Dd is the vertical thickness at D , or d is a point in the extrados.

For it is evident, that $Da : Db :: Db : Dc :: Dc : Dd$, because of similar triangles; therefore $Da : Dd :: \text{rad.}^3 ab : Dd$, or inversely as radius to cube sine ab . Now Da is the thickness at crown, and Db is therefore the thickness at D . Figure 7 is constructed in this way, and may serve as a specimen of the equilibrating extrados for a semicircular arch. By reversing this operation, we may find the thickness at the crown corresponding to a given thickness at any other point. And

3 P

here we may observe, that as D approaches the extremity B of the semicircle, the line Dd rapidly increases, until at the point B it is of an infinite length. But indeed this must evidently be the case with every arch which springs at right angles with the horizontal line; for the thrust of the arch should be resisted by a lateral pressure, and no vertical pressure can act laterally on a vertical line.

We may also observe, that since the extrados or upper outline descends first on each side of the crown, and then ascends with an infinite arc, there is, for any thickness of the crown, a point on each side, where the upper edge of the extrados is on a level with that on the crown. Thus, if $BD=30^\circ$, its sine is half the radius. Dd is therefore $\frac{1}{2}$ of Dd , so that if $Vv=Dd$ be made $\frac{1}{4}$ of VC the radius, we have the point d at the same level with V . Between this point, however, and the crown, there is a considerable depression, which is increased if the crown be made still thinner. On the other hand, if it be made thicker, the horizontal line drawn through the crown cuts the extrados much nearer the middle of the arch. It appears, therefore, that the circle is not well adapted for the purposes of a bridge, or a road, where the roadway must necessarily be nearly level; for no part of the extrados of the circular arch will coincide with the horizontal line. There is indeed a certain span, with a corresponding thickness at the crown, where the outline differs least from the horizontal; that is, an arch of about 54 degrees, with a thickness at the crown about $\frac{1}{4}$ of the span. But that is far too great for practical purposes.

We may, however, extend the construction just given, even to those arches that are formed of portions of circles differing in curvature. For the equilibrating extrados being first constructed for that portion of the arch in which the crown is, as far as the vertical line passing through the contact of the neighbouring curves, the thickness of the crown must be supposed to be enlarged, in proportion to the diminution of the radius of curvature, or the contrary, and, with this, proceed as before along the succeeding branch of the curve. This will, indeed, cause an unsightly break in the extrados, for which we shall not at present pretend to find any other remedy, than using materials of a different specific gravity.

Those who wish to examine this subject farther, may consult Emerson's *Fluxions*, or Hutton's *Principles of Bridges*. We shall only observe here, that the extrados of the ellipse, and of the cycloid, resemble that of the circle, having an infinite arc on each side at the springing; and indeed this, as has already been observed, is a general rule for all those curves which spring at right angles to the horizon. In the parabola, the extrados is another parabola exactly the same, only removed a little above the other. In the hyperbola, the extrados is another curve, which approaches the interior arch towards the springing. None of these curves, therefore, can, with propriety, be employed for the arches of a bridge, though there may be cases where a single arch might with propriety be formed into a conic section.

The catenaria, which has been much spoken of as the best form for an arch, has an extrados, the depression of which, below its crown, at any point, is to the depression of the curve in the same vertical line, in a constant ratio. This ratio is that of the constant tension at the

vertex, to the same tension diminished by the thickness or vertical pressure in the crown. If the vertical pressure be less than the tension, the extrados falls below the horizontal line; if greater, it will rise above it.

Mathematicians finding the circle and other common curves so little adapted to the arch of a bridge, which has a horizontal roadway, have, in the next place, endeavoured to solve the converse of the problem, and give a rule for finding the intrados or figure of the arch, which have the exterior curve a horizontal line.

This problem can only be resolved by calling the fluxionary calculus to our aid. It is a case of the more general one to find the intrados, when the extrados is given; and being the most useful case of that problem, fortunately admits of a solution comparatively easy.

We have already seen, that the load DC is inversely as $\text{rad. curv.} \times \sin^3$ inclination to vertical. Calling therefore, as usual, the abscissa $VE=x$, $CE=y$, $VC=z$, we have $cf=x$, $fe=y$, $Cc=z$; and since $Cc:cf::\text{rad.}:\sin.$ inclin. at C ; therefore the load DC is inverse-

ly as $\text{rad. curv.} \times \frac{y^3}{z^3}$. But, as is well known, the rad.

of curvature $= \frac{z^3}{yx - xy}$; therefore, by multiplication,

DC is inversely as $\frac{y^3}{yx - xy}$, that is, directly as

$\frac{yx - xy}{y^3}$, or as $d\left(\frac{y}{x} + \dot{y}\right)$, and is equal to $d\left(\frac{y}{x} \times \frac{C}{y}\right)$,

where C is a constant quantity, found by taking the real value of DC at the vertex V of the curve.

Now, in the present case, calling $AV=a$, we have

$DC=a+x$, ($AV+VE$), therefore $a+x=\frac{C}{y} \times \text{flux. of}$

$\frac{y}{x}$. Take $\frac{x}{y}=u$, and by integrating, we have $u=$

$\sqrt{\frac{a^2 x + x^3}{C}}$, and therefore

$\dot{y}=\left(\frac{\dot{x}}{u}\right)=\sqrt{C} \times \frac{\dot{x}}{\sqrt{2ax+x^3}}$; whence by integration

$y=\sqrt{C} \times \text{Lo.}(2ax+2x^2+2\sqrt{2ax+x^3})+B$.

At the vertex $x=0$, therefore

$y=\sqrt{C} \times \text{Lo.}(2a)$

And consequently the ordinate

$y=\sqrt{C} \times \text{Lo.} \frac{a+x+\sqrt{2ax+x^3}}{a}$.

Lastly, to find the value of \sqrt{C} , we take some point of the extrados, where the ratio of x and y is known. For example, if the span $=2S$, and height $=h$ are given,

we have $S=\sqrt{C} \times \text{Lo.} \frac{a+h+\sqrt{2ah+hh^2}}{a}$,

hence $C\sqrt{S}=\text{Lo.} \frac{a+h+\sqrt{2ah+hh^2}}{a}$,

and finally $y=S \times \frac{\text{Lo.} \frac{1}{a}(a+x+\sqrt{2ax+x^3})}{\text{Lo.} \frac{1}{a}(a+h+\sqrt{2ah+hh^2})}$

We subjoin a Table, calculated by Dr Hutton from this formula, for an arch of 100 feet span and 40 feet

rise, the thickness of the crown being taken at 6 feet. It is nearly of the same dimensions as the middle arch of Blackfriar's Bridge, and which may answer for any arch where these dimensions are similarly related to each other.

The curve of Fig. 8. Plate LXXX. is accurately drawn to these dimensions, and may give an idea of the form of an equilibrated arch. It is not destitute of grace, and is abundantly roomy for craft.

Such, then, is the analytical theory of equilibration; for a practical subject it does, we confess, appear abstruse.

Those who have already studied the theory, will observe, that we have greatly simplified the investigation. The construction we have given for circular arches we shall probably find useful hereafter. We could with pleasure have prosecuted the subject farther, not only as it affords some good general views of the equilibration of arches, but exhibits also several beautiful examples of the application of the higher calculus. Yet we must repeat, with all due respect to the learned and eminent men who have turned their attention to it, that we fear their speculations have been of little value. In saying this, we do not mean to surmise, that their deductions are any way erroneous; they are legitimate consequences from the principles assumed. But it appears to us, that the writers on equilibration, like many others who have hastily applied analysis to physics, have taken too narrow a view of their subject to comprehend all the variety of practice. Setting out with one leading principle, best adapted, perhaps, to the application of calculus, they neglect the numerous circumstances by which it may be modified, and which are too important to be overlooked in drawing practical inferences from such an investigation.

Their principal care respects the figure of the soffit, a thing which the practical engineer knows may admit of the greatest variety. As to the thickness of arch-stones, side wall, and piers, the horizontal section or ground plan of the bridge, the manner of filling up its haunches, of forming the joints, of connecting it with the abutments, wing walls, &c. we are still left in the dark.

The analytical writers have assumed one leading principle, that the arch is in every point kept in equilibration solely by the gravity of the superincumbent column of matter. Now, it is even doubtful whether this principle be true. At any rate, they do not consider the

numerous modifications which it receives, from the cohesion of that matter among itself; from the mutual cohesion and friction of the archstones; from the position of their joints; from the different specific gravity which the arch and superincumbent matter have, or which they may be made to have; from the lateral, and in some cases hydrostatic pressure, propagated to the masonry throughout that matter; and, in fine, from a number of other causes, which, if not singly, are, when combined, at least of as much importance as the gravity of the vertical column of matter alone.

Let us turn, therefore, to another mode of considering this subject, which has been adopted by De la Hire, Parent, Belidor, and many others on the continent, and in our own country by the ingenious Mr Atwood.

The latter has, from the known properties of the wedge, and the elementary laws of mechanics, exhibited to us a geometrical construction for adjusting the equilibration of arches of every form. The mathematical reader, who has not lost his relish for the ancient geometry, will find there an elegant specimen of its application; for he completes his geometrical construction without once having recourse to any other than the principles of elementary geometry and trigonometry. It had been well, indeed, if he had adhered longer to that mode of investigation; for, by applying the analytic form too early, he has been led unawares to consider that only as an approximation to the values of the quantities sought after, which, in fact, is the expression for the values of these quantities themselves. Nevertheless we owe much to Atwood: he has shewn, that the advantages of equilibration are not confined to any particular curve; that the drift or horizontal thrust of an arch may be easily found; and that an arch may have all the advantages of equilibration, whatever its figure may be, merely by adjusting the joints of the arch-stones.

The stones, or sections of an arch, being of a wedge-like form, have their tendency to descend opposed by the pressure which their sides sustain from the similar tendency of the adjoining sections. Should this pressure be too small, the stone will descend; should the pressure be too great, the stone will be forced upwards.

These pressures act in directions perpendicular to the touching surfaces; for, if the original direction of any pressure should be oblique, it may be resolved into two forces, of which, while one is perpendicular to the surface, the other is parallel to it, and, of course, neither increases nor diminishes the perpendicular pressure.

The wedge A, Plate LXXX. Fig. 9, if unimpeded, would descend in the direction vo, but is prevented by the re-action of B and B', acting in the directions pq and $\kappa'1$, perpendicular to the sides ΛG , QD ; and it is known, from the properties of the wedge, that if pq, or $\kappa'1$ be to the weight of the wedge A, as DO is to DC , the wedge A will remain at rest. If also the wedge A be only at liberty to slide down GA , considered as a fixed abutment, then the force pq alone will keep it in equilibrio. The force pq being perpendicular to DO , has no tendency to make A slide either up or down on that line, but produce it towards N , making NX equal to pq; then this force acting obliquely at N , may be reduced to two others, viz. MA perpendicular to AG , expressing the perpendicular pressure on the abutment of A, and NW expressing the force or tendency it has to make A slide upwards along AG . Again, take the vertical line Λa , expressing the weight of A, and draw aH at right angles to AG ; it is very evident, that aH expresses the

tendency of A by its weight to slide down GA. AH is opposite, and is equal to NR.

For, draw the perpendiculars bd and af , then the triangles Aah , Agf , Dgd are evidently similar; and also the triangles odg , oqn , mnr , as they have always a common angle besides the right angle. Now the force pq , that is, mn is to the weight of A, that is aa , as od to dg by supposition.

And $aa : AH :: AG : af :: DG : dd$

Therefore, $MN : AH :: OD : dd :: MN : NR$.

Or MN has the same ratio to AH , that it has to NR ; that is, AH and NR are equal, or the tendency of A to slide downwards by its weight, is balanced by the tendency of MN to make it slide upwards: wherefore the section A remains at rest in equilibrio.

Considering the whole arch as completed, with its parts mutually balancing each other, the force pq , which is necessary for sustaining the wedge A, will be supplied by the reaction of the adjacent wedge B. Now, let it be required to ascertain the weight of B in proportion to A, so that they, being adjusted to equipoise, may continue to be in equilibrio, when left free to slide along KB . Since mn is the pressure produced by pq in a direction perpendicular to AG , we must add to this ha , which is derived from the wedge A; therefore make mn equal to ha , produce mr to y , take yz equal to rn , draw zw at right angles to KB ; yw is the force tending to make B slide up BK : take therefore bn' equal to yw , draw the perpendicular $n'b$ meeting the vertical ab in b ; nb will represent the necessary weight of the wedge B; and the whole is so evident from the composition of pressures, as to require no further demonstration. Such is Atwood's construction; he has rendered the demonstration much more prolix, by the unnecessary introduction of trigonometry; and after shewing how the weight of the sections C, D, &c. may be found in the same way, he goes on to reduce these weights and pressures to analytical and numerical values. He finds these in terms of the sines and tangents of the successive angles of inclination; but in reducing these to numbers, he has been led to the accumulation of small errors in that very operose way of proceeding, to give erroneous results; and into the singular mistake of conceiving, that the real expression of these values was only an approximation. Had he recalculated the whole by more extended trigonometrical tables, they would have quickly undeceived him; and they would have shewn him, that what he was thus searching so deeply for, was all the while lying exposed at the surface; that the apparent difficulties were entirely of his own creation, and his imagined accuracy was error. This should teach mathematicians to beware of thinking calculation the surest mode of eliciting truth. It should be the last thing employed. Nothing is so simple, so perspicuous, as the diagram. Its geometrical properties should be pursued as far as possible. They are not only clear, they are palpable. And in such applications of mathematical theory, the whole being a creature of the mind, it seldom admits of an approximating value in any part.

Let us now return to the geometrical construction.

The weight of the section C, may be determined in the same way as the foregoing. But surely more simply thus: From c draw cs parallel to wz , that is at right angles to ko , and make it equal to $wz + n'b$; draw sc at right angles to ko , meeting the vertical cc in c , then cc represents the weight of C. From d , draw dr pa-

rallel and equal to sc , draw rd perpendicular to no , meeting the vertical dd in d , dd is the weight of D, and so on successively.

Nay, instead of drawing dr parallel to sc , and rd perpendicular to no , we may at once draw from s , sd' perpendicular to no , which will cut off for us $c'd' = dd$, the weight of the section D. It is of no consequence, although the lines of abutment do not all run to the same centre o .

And thus we obtain a general construction for all the sections, which turns out abundantly simple, Fig. 10: for, upon any vertical line $b'e$, if cd be taken to represent the given weight of any section C, and cr be drawn at right angles to co , and dr at right angles to bo , meeting the other in r : then rb represents the pressure against the abutment ob , and rc the pressure against oc , and by drawing rd at right angles to bo , re to eo , &c. we have the weights of the successive sections represented by cd , de , &c. and the pressure on their lower abutments represented by rb , re , &c.

We may carry the same mode of determination to the other side of C, and pass the vertex of the arch. The divisions representing the weights of the sections will run upwards along the indefinite line $c'd'$. The pressures on the abutments will be determined as before. Should the two sides of a section be parallel, the perpendiculars through r upon them will coincide; such a section therefore, should have no weight. But should the two lines of abutment diverge towards the lower side, the line expressing the weight of that section will return upon the vertical, shewing that such a section requires the reverse of weight, viz. a support from below. The line rv drawn horizontally through r exhibits the horizontal pressure, which is uniform through the same equilibrated arch. But it is evidently greater, the less dr and cr are inclined to each other, the weight bc being constant, that is, the smaller the angle of the wedges or sections. It also increases directly as the weight of the section C, &c. The line ve expresses the weight of the semi-arch or perpendicular pressure on each pier; being the sum of the weights of all the sections in the semi-arch.

Again, it is obvious that the angles drb , or crd , &c. are equal to the angles of the sections boc , cod , &c. If therefore the weight of any section E be given $= de$, and the requisite angle of that section be required, every thing else being known, we have only to join re , and the line eo being drawn perpendicular to re , will exhibit the inclination of the lower abutment of the section; dre is the angle of that section. And here it matters not where the point e be, that is, how great the base of the section be, provided the weight is equal to de . We also see that while the angles remain the same, and the weights proportional, it is of no consequence what the curve passing through the lower edges of the sections, or through their upper edges may be, they may even be straight lines. According to this principle, the architect is not confined to given forms of intrados or extrados; he may take whatever curve appears most beautiful or useful: and, what is more, by the proper adjustment of the joints, he may cast the ultimate pressure in any direction which he thinks most conducive to the strength of the edifice.

The reader will easily perceive, that the segments of the vertical line rapidly increase, as the perpendiculars to the line of abutment approach the vertical; that is, as the abutments approach the horizontal line; and in that

position, the last segment becoming infinite, it is impossible by mere weight alone to effect the adjustment of the sections.

Though the geometrical construction we have just given is so simple, that it appears likely to answer every practical purpose; yet it may be proper to express analytically, or rather arithmetically, the values of the several quantities concerned in the investigation. This is attended with no difficulty, as $\tau v e$ being a right angled triangle, it is obvious that the weight $v e$ of the same arch is the tangent of $v r e$, or of the inclination of the lower abutment, when τv the horizontal force is radius; at the same time also, the pressure τe on the abutment is the secant of the same angle; and the weight $c d$ of any section is the difference of the tangents of the inclinations of its upper and lower abutments. In like manner $a v$, the weight of half the key-stone, is to τv the horizontal force as the tangent of half the angle of that section is to the radius; or, as radius is to the cotangent of the same angle.

We now proceed to shew the application of this investigation to some practical cases, and the first we shall consider, is that known by the common, though awkward name of the *flat arch*; Plate LXXXI. Fig. 1. one with which every mason is perfectly familiar, though it be seldom noticed by writers on equilibration. $AB\delta a$ is a structure of this kind, adjusted to this equilibrium, and resting on the abutments Aa , $B\delta$. Its construction is exceedingly simple; nothing more is necessary than to draw all the joints $m M$, $l L$, &c. to one centre C ; and the reason is obvious; for DK , KL , &c. are the differences of the natural tangents of the inclinations of the abutments, the perpendicular CD being radius; and the same thing is true in the line da , and in every other parallel section. The surface therefore $A m$, $M l$, that is, the bulks or weights of the stones, are in the same ratio, and it is that which is required by the above principles. Also, if we assume the line of its base to represent the weight of any stone in the arch, for example, KD for half the keystone; then the perpendicular CD is the horizontal thrust, drift, or shoot of the arch. By increasing DC , or diminishing it, that is, by drawing the joints to a lower, or a higher centre, we may alter this thrust at pleasure. What if we should take C up to D ? Some curious ideas occur here, but being chiefly speculative, we shall not now pursue them. They serve to connect this case very neatly with the lintel and the Egyptian arch, (or that formed by flat courses of stones gradually overlapping each other, until the opening be covered), in each of which the horizontal thrust vanishes. We ought also to observe, that whatever weight of stuff lies on an arch of this kind, there is no change of design requisite, so long as the upper surface or roadway is horizontal. For being every where of the same height, the mass incumbent on any stone will be proportional to its base, viz. the back of that stone; since we must conceive the stuff to press vertically. It is therefore the same as if the whole arch had undergone a change of specific gravity; every pressure will be increased in the same proportion.

The design of an equilibrated horizontal arch, or plat band, being thus easily formed, it will not be difficult to extend it to a curve of any form, $abb'd'a'$, Plate LXXXI. Fig. 1. is an arch of this kind. It is a circular segment from the centre C , to which the joints of the horizontal arch were directed; the two key stones have the same weight and obliquity of abutment; consequently the

horizontal thrusts are the same. The other arch stones being previously intended to have the same weight with those of the flat arch, it is only necessary to draw the lines 1 1, 2 2, 3 3, parallel to Kk , Ll , Mm , and so as to produce this equality. This being merely a simple problem in mensuration, we shall not occupy the reader's attention with the solution of it. In the figure referred to, we have divided the soffit AB of the flat arch into equal parts; all the stones therefore of that as well as the curvilinear form, are of equal magnitude and weight, the angles of the arch stones only varying. We might make a table of these angles, to any given form of key-stone, but it is really unnecessary; for we have only to take the tangent of half the angle of the key stone, or more correctly, of the angle of inclination to the vertical of one abutment to the key-stone, from a table of natural tangents, and by adding to it twice the same number successively, we have the natural tangents of the inclinations of all the other abutments. We believe, however, that the practical builder will prefer a geometrical construction to this, and lay off his joints by means of the common bevel.

Before we take leave of the straight or flat arch, there is another of its properties we would wish particularly to be noticed. The reader must have already observed, that when CD expresses the horizontal thrust, or pressure of the vertex, CK , CL , CM , &c. express the perpendicular pressures on the successive joints Kk , Ll , Mm , &c. Now, it is obvious, that Kk , Ll , &c. are proportional to CK , CL ; for AD , ad , are parallel. Therefore the vertical sides of the arch being parallel, the pressure on each joint of the flat arch is always proportional to the surface of that joint, and the pressure on each square inch of joint throughout the arch is always the same. It may readily be found too, by dividing the horizontal thrust by the area of the vertical section Dd . This is a most valuable property, for it secures uniformity of action in every part of the structure. But it is not to be found in the arch abd ; for there, the joints being nearly equal, the pressure on each increases as we descend from the vertex, and may, at the lower sections, be eventually so great as to overcome the cohesion of the materials.

It may be objected to the straight arch, that the acute angles, as Aag , AMm , are very apt to chip away, and weaken the arch. Now this is certainly true, but it has no connection with the doctrine of equilibration. There is, however, a very ingenious mode of remedying it; for if the upper and lower extremities of each joint be drawn to a centre, considerably below the former, or even be formed into vertical lines, as at m , n , it will materially strengthen the acute corners without injuring the equilibration. We may conclude, therefore, that a structure of this kind possesses every requisite that can be looked for in an equilibrated arch. Is the flat arch, then, which admits, with such facility of the most perfect equilibration, one of the strongest possible figures? We believe every practical man can give us a prompt answer to this question. But, before we take any farther notice of it, we shall proceed somewhat farther with the applications of our theory. The segment abb was adjusted to equilibrium, with reference to the flat arch, upon the principle that the weight of the archstones was only to be provided for. In general an arch of this kind is filled up at the flanks, so as to form a roadway as nearly as possible horizontal. We must, in that case, when considering the weight of each archstone, not lose

sight of the difference of pressure upon it, arising from the varying height of the incumbent mass. Having, therefore, divided the back of the arch into sections d 1, 1 2, 2 3, Plate LXXXI. Fig. 2, each containing one, two, or more arch stones, and having drawn the vertical lines from these divisions to the line of roadway, we calculate the weight of the trapezoid of the stuff over each section; add this to the weight of the section; and divide the tangent line or flat arch accordingly.

We may even give a construction for this. The stuff over any section 2 3, is proportional to the trapezoid t 2 3 v , or nearly $tv \times sw$; for we need take no notice of the small segment of the circle between 2 and 3, but consider the arch as polygonal, in which case the mean height is sw .

But 1 2, 2 3 being equal, we have tv or $2y$ as sine of 2 3 y (i. e.) as sine of the inclination of the arch; wherefore, drawing the mean height ws , and producing Cw to meet the perpendicular ax , take the weights over the sections to be represented on the horizontal line, by lines equal to wx respectively; for sw is to wx nearly as 2 3 is to 2 y , and tv , at the vertex of the arch, is equal to 2 3; and since the weight of the archstone will be nearly constant, and that on the supposition that the weight over each section is represented by the trapezoidal space included between it and the roadway, let us assume the weight of the keystone, as represented by the part dP , and the others by similar additions. If we have an arch differing in gravity from the stuff which loads it, we can measure to a circle within, or without the circle of intrados $PTuW$. Draw, therefore, the horizontal line Po , and lay off Pa equal to $\frac{1}{2} Pq$ for the half keystone and its load, lay off also $ab=ln$, $bc=ux$, &c. and these divisions will represent the weight of the several sections, the superincumbent matter being included.

This method is evidently only an approximation; we consider the principal load as arising from the mass incumbent on each section, or at least that the weights of the sections are proportional to these masses. It becomes pretty accurate, by taking w in the mean circle drawn between the soffit and back of the arch; and we might render it still more accurate, by giving the determination a fluxionary form, but we write at present for the practical builder, to whom the calculus is seldom known; besides, as the reader will see hereafter, we do not think the rigid determination of this matter as yet of much consequence.

Having thus discovered the weights of the sections, and laid them off on the horizontal line, as if for a flat arch, and having, either from the given form of the keystone, or the horizontal thrust, drawn the angles of abutment which a flat arch would require, the joints of the arch in question are to be drawn parallel to these, and through the extremities of the proper sections, previously marked out, as above mentioned. If there be intermediate joints, they may either be drawn properly related to the others, or separately, discovered by a repetition of the construction. For example, let C , (Plate LXXX. Fig. 2,) be the given centre for the keystone; draw Ca , Cb , Cc , &c.; and through 1 draw the joint 1R parallel to Ca , also 2T parallel to Cb , and 3W to Cc , &c.: the arch would then be in equilibration.

Thus we find, that, by the proper adjustment of the joints to the weight of the section, we may form equilibrated arches, having soffits of any figure that may be thought proper, and with any proportion of dead weight over them that circumstances may require. Let us now look

at the converse of this problem; where, the inclinations of the joints being given, it is required to discover the mass or weight which must be allotted to each section, so as to preserve the whole in equilibrium.

Pursuing the mode already employed, it is evident, that if we lay off from one centre the angles to be formed by the successive joints, or abutments, with the vertical line, a horizontal line drawn to cut them will represent, by its successive segments, the weights of the several sections; while, at the same time, the perpendicular let fall from the centre on this line will exhibit the horizontal thrust. If the arch, therefore, must throughout be of equal thickness, we have only to mark off upon the soffit, or rather upon the mean curve, segments proportional to those of the horizontal line. If the upper and lower outline of the arch be determined, we must divide it into trapezoids, having the same proportions; then draw the joints parallel to the lines expressing the given angles of inclination. Such joints will run to several different centres, thereby shewing us, that their union in one is not at all necessary to the security of the arch, even should that be a portion of a circle.

The position of the joints is usually given in a different way from that which we have just considered. In circular arches they are generally formed by producing the radii from the centre; and in others they are commonly drawn perpendicular to the curve. Now, though we have just shewn, that this is by no means necessary to the equilibrium, yet, as it is in reality the most convenient in practice, it may be of importance to attend to the effects likely to be produced by this modification.

We see, in Plate LXXX. Fig. 10. that the tangents on the horizontal line rapidly increase as we pass outward, and we should therefore increase, in the same proportion, the weight of our sections. We cannot increase the base as proposed above, for that is necessarily given by the position of the joints, but, as we are still able either to increase the height or the breadth of the sections, we may consider the effect of both these modes.

Let it be required, then, to equilibrate a circular arch, where the stones being all of equal thickness, with joints equally distant, and drawn all to one centre, we are only at liberty to increase the width of the roadway, or length of the horizontal courses.

Considering each course of arch stones as a prism of a given base, a supposition sufficiently accurate, it is evident, that its magnitude or weight increases with the length only. But this weight must, from the principles already laid down, be as the difference of the tangents of its abutments; the length therefore must be in that ratio. Accordingly, we find the breadth at different distances from the vertex in the same way with the weights of the sections: the breadth at 45° must be double, and at 55° must be about triple of that at the crown, and will increase still more rapidly afterwards. Proportions such as these may answer well in the short flight of steps for a flying staircase, but are quite unfit for our present purpose. When we recollect, however, that in a bridge, the extraordinary expansion towards the haunches is materially corrected by the increased pressure of the incumbent mass in that part, we are encouraged to proceed a little farther, and consider the effect of the second mode of effecting the equilibrium.

The pressure of matter upon each section has already been stated as proportional to $tv \times sw$; Plate LXXXI.

Fig. 2. but rv is the difference of the sines of the angular distances of the successive abutments from the vertex, and sw is the mean versed sine added to the given thickness at the crown, when the roadway is horizontal. We have therefore the pressure as the difference of the sines \times (mean versed sine $+$ thickness at vertex.) But these pressures are also, from the theory, as the difference of the tangents of these angular distances. In the present case, where the angles of abutment, and consequently, where the difference of their sines and tangents are known, and where the mean versed sine may also be readily formed, it will not be difficult to state the conditions of equilibrium for an arch of any dimensions.

In the common mode of building, we must give the arch a sufficient thickness at the keystone, to resist the horizontal thrust, ensure stability, and bear the loads likely to come upon it. We must also cover this part with a certain thickness of gravel, or other matter, so as to form a roadway. The varying pressure of the wheels of a loaded carriage, when it is propagated through this stratum of gravel, will be so far diffused as not to disturb the stone immediately below it, nor injure the bridge by splintering away its corners. This thickness is made as small as possible, that the bridge may not be unnecessarily elevated, and the roadway is preserved nearly horizontal. The other courses of archstones too, do not often differ much in thickness from that at the crown. But although these things are pretty constant, there is a considerable degree of latitude in filling up the space between the back of the arch and the roadway. It may be done with substances varying in density, from the lightest charcoal or pumice, open shiver or chalk, to closely rammed clay, or even solid masonry; and it is not uncommon to make, in various ways, open spaces in the masonry of the spandrel, covering them above, so as still to support the roadway.

It will therefore be proper for us to enquire, what is the density requisite over every section of an arch, where the thickness of the crown is given, the roadway horizontal, the arch of uniform thickness, and the angles of abutment of the several sections constant, that is, all drawn from the same centre; or, what is the same thing, let us suppose the structure built up to the horizontal roadway with parallel sides, and then enquire, what is the proportion between the pressure borne by each section, in this way and the pressure of equilibrium; we shall thereby discover the ratio in which the density of the backing must, if needful, be diminished; and the quantity of expansion necessary towards the springing of the arch, that the advantages of equilibration may be preserved, even in this state of things.

Before we give a more rigid determination, we should wish to shew the practical builder, that the solution of this problem may be easily approximated to, by the help of the trigonometrical tables. For we may suppose the matter of the archstones to be the same in specific gravity with that which lies above it; and as there can be no impropriety in considering the arch as polygonal, from joint to joint, our mean versed sine is only half the sum of those at the two joints. The supposition is not strictly accurate, but it is sufficiently near: greater strictness would only serve to render the calculation more complicated, without making it more useful.

The following table exhibits, in the first line, the supposed sections of the polygonal vault, taken 5° asunder. The second line is the angles of abutment, or inclination of each joint to the vertical. The third, the ratio of weight in each section, taking as the standard $872\frac{1}{2}$, or the length of the arch of 5° in 1000ths of radius; of course this line is merely the differences of the natural tangents taken at every 5° .

1	Key	2	3	4	5	6	7	8	9	10	11	12
2	2°	$7\frac{1}{2}^\circ$	$12\frac{1}{2}^\circ$	$17\frac{1}{2}^\circ$	$22\frac{1}{2}^\circ$	$27\frac{1}{2}^\circ$	$32\frac{1}{2}^\circ$	$37\frac{1}{2}^\circ$	$42\frac{1}{2}^\circ$	$47\frac{1}{2}^\circ$	$52\frac{1}{2}^\circ$	$57\frac{1}{2}^\circ$
3	872	880	900	936	989	1063	1164	1302	1489	1749	2119	2664
The excess of each section over the key section will therefore be												
4		8	28	64	117	191	292	430	617	877	1247	1792
But we must consider, that a part of the thickness at the crown is roadway, and this not, like the arch-stones, kept of uniform magnitude over each section, but must be diminished in the ratio of the differences of the sines of the abutments, or horizontal bases. These differences are												
5	872	869	859	842	819	790	755	714	668	617	561	499
Now suppose the roadway, and other constant superstructure, to be at the crown of equal weight with the arch-stones; a supposition not far from the truth, and from which any small variation is not of great consequence; the weight of arch-stone and roadway will be a mean between lines 3 and 5, or												
6	872	871	866	857	846	831	814	793	770	745	716	686
And the excess of weight necessary on each section, will be												
7	0	9	34	79	143	232	350	509	719	1004	1403	1978
Which is only about a fifth more than the preceding. And this must be provided for in the spandrel, or over the flank of the arch; the solidity of which will be found, by multiplying the numbers in line 5 as bases, into the mean height of the matter at each section. These mean heights, or versed sines, are,												
8	.00024	.00381	.01519	.03407	.06037	.09369	.13397	.18085	.23306	.29289	.35721	.42642
when the roadway is horizontal. And the effect of line 5, into line 8, which will express the end of the prismatic section over each arch-stone, will be												
9	.2	3.4	13.1	28.7	49.4	74.0	101.1	129.1	156.0	180.6	200.3	212.8
In which observe, that the unit of height is radius, the bases being expressed in the same notation as in expressing the weights. If a number in this line be divided by its corresponding number in line 7, it will express the thickness at the crown, in terms of the radius, which equilibrates the matter over the corresponding section, between the arch and horizontal roadway; when that stuff is filled solid, and of equal density with the arch, of course these thicknesses are												
10		.39	.385	.363	.345	.319	.288	.254	.217	.180	.143	.108

The use of this will be understood by the following example. Suppose the thickness at crown $\frac{1}{4}$ of the radius of the circle, or .142857, which answers very nearly to the 11th key. We see by this last table, that the flanks of the arch over that key, or at 50° on each side of the arch, must be filled solid. Between that and the crown they must be lightened, by using lighter matter, or making vacant spaces in the spandrel: and at a greater distance from the crown, the flank, although solid, will be too light for a crown of $\frac{1}{4}$; so that we must expand or increase the breadth of the arch, in order to preserve

the equilibration. Every different thickness of crown will require a different arrangement in this respect. Without therefore prosecuting this farther, let us assume the thickness equal to $\frac{1}{10}$ of the radius, or $\frac{1}{10}$ of the span in a semicircle; a proportion not unusual, and of easy calculation; from thence, to find the density of the matter in the spandrel, take the numbers of line 7, divide by those of line 9, and multiply by the given thickness $\frac{1}{10}$, that is, divide by 10; we have for the density in the spandrel, in that case,

11	.26	.26	.270	.289	.313	.346	.394	.460	.555	.700	.93	(.13)
----	-----	-----	------	------	------	------	------	------	------	------	-----	-------

Accordingly, the density beginning at $\frac{1}{4}$ about the crown, must be about $\frac{1}{4}$ at 30° from it, and thence gradually increase till about 60° , where it must be 1, or equal to that of the arch. After that, if no denser material can be employed, the arch must be expanded in breadth, having already arrived at the limit of density.

If we make the thickness at the crown $\frac{1}{10}$ of radius, the densities will just be $\frac{1}{10}$ of the above numbers; the point of solidity will be removed a little farther from the crown; and indeed whatever be the thickness, the densities will be proportional to the above numbers, and may easily be had from them.

The above is for a horizontal roadway. There will be some alteration requisite if the road be made to slope up the arch: the quantity of pressure that is thus lost, must be corrected by increasing the density of the spandrel; and this will be more necessary towards the springing. It will not be difficult for the practical builder to form an

idea of its effect. Take the section at any part, say 30° from the crown, where the horizontal distance is $\frac{1}{4}$ of radius; suppose the road to slope 1 in 10, for example, which is great, the fall will have become $\frac{1}{10}$ of radius, or .05; the versed sine is .1339, accordingly the height in the spandrel is reduced to .0839, and the density being increased, inversely as the height, we have .552 in this case at 30° instead of .346, other things being the same. Yet this density is too great; for the solid matter in the roadway will be increased, being lengthened by sloping. At the same time it admits of doubt, whether it may not be made thinner, in the same proportion; for its oblique position gives a greater vertical thickness. This will preserve the density at .552, and the whole series will be found, by deducting $\frac{1}{10}$ of the sine from the versed sine in col. 8, and proceeding with the remainders as with col. 8, as follows:

MVS	8.00024	.00381	.01519	.05407	.06037	.09369	.13397	.18085	.23306	.29289	.35721	.42642
$\frac{1}{10}$ of MS	.218	.00872	.01736	.02588	.3420	.4226	.5000	.5735	.6428	.7071	.7660	.8192
diff.	-.00194	-.00491	-.00217	+.00819	.02611	.05143	.08397	.12349	.16968	.22218	.28061	.34450

And the effect of this height into the diff. of sines will be

	-1.6	-4.3	-1.8	+6.9	22.2	40.6	63.4	88.2	113.4	137.0	157.4	172.0
And the density	-2.2	-1.9	+1.15	.645	.57	.552	.577	.577	.634	.733	.891	1.15

Where we find the density in no case less than $\frac{1}{10}$, which is about 30° from the crown, and it increases both ways, about $\frac{1}{4}$ at 45° and at 19° , and solid about 53° and $16\frac{1}{2}^\circ$, the first 10° are marked negative; for we should observe, that when we keep the thickness at the crown $\frac{1}{10}$, the parallel to the roadway cuts the curve of arch-stones. We ought in fact to make the roadway of a proper thickness where the arch approaches nearest to it, and relieve the crown by rounding the two inclined planes into each other. This will also tend to diminish the density necessary in the spandrel; for the height will be a little increased, while at the same time a greater pressure is derived from the solid roadway. But we choose to allow the example to remain in this way, that the reader may see that every necessary information can be got, even in this way of considering it.

A smaller degree of slope, as 1 in 20, or 1 in 40, will tend to diminish still farther the density necessary in the spandrel, and approximate it to those found for the horizontal line. We might calculate the densities as well for these useful slopes, as for other thicknesses of the crown or proportions between the key-stones and superincumbent roadway, which, in the preceding en-

quiry, is taken at equality; but we forbear doing so, being satisfied with giving the intelligent practitioner clear ideas of the subject. He already knows there are pretty wide limits to his practice; and, if the case be any way delicate, we should think any person deserving the name of architect may, after what we have said, go over the necessary calculations for himself.

The mathematical reader will perhaps say, that we have taken a very awkward and unscientific mode of resolving this problem; we are not, however, inclined to admit that opinion. Our object has not been to give a specimen of the application of calculus; but to shew the practical builder how a good conception may be formed of the relative pressures in different parts of his arch, and this by a process purely arithmetical, and which is level to every capacity. We conceive that this is the way to make our speculations really useful, and perhaps it were well if scientific men had this oftener in view. Neither have we carried our results to many figures, like some authors, who give five or six places of decimals; for we have considered that no common modes of measuring either distances, angles, or weights, can proceed to any thing near that nicety. Yet, that we

may not rest satisfied with an approximation without shewing what degree of accuracy can be obtained, and especially that we may render this mode of conceiving the subject more useful by a more complete solution of the problem, we proceed to the following analytical investigation.

We have already shewn that the weights of the sections must be proportional to the differences of the tangents of the successive angles of abutment.

This is to be provided for,

1st, By the weight of the arch-stones; here taken as constant.

2d, By the weight of matter forming the roadway, &c.; here taken as of uniform thickness, and varying in effect only as the difference of the sines of the distances from the crown.

3d, By the matter in the spandrel; which may be made to vary in density, and is equal in the longitudinal section to the versed sine multiplied into the difference of the sines.

Take z , the angular distance from the vertex, δ the density in the spandrel, a the thickness of the arch or keystone, r the thickness of the road, &c. at the crown.

The sections are $= (a+r)$ flux. $\tan. z = (a+r)(1+t^2z)z$

The road is $= r \times$ flux. $\sin z = rz \cos. z$, wherefore

$(a+r)(1+\tan^2 z)z = az$ for the archstone

$+ r \cos. z z$ for the road

$+ \delta \times \cos. z z \times V \sin. z$ for the spandrel

that is $a+r+t^2z(a+r) = a+r \cos. z + \delta \cos. z \times V \sin. z$

and $t^2z(a+r) + r V \sin z = \delta \cos. z \times V \sin z$

$$\delta = \frac{\tan^2 z}{\cos. z \times V \sin. z} (a+r + \frac{r}{\cos. z}) \text{ or } \frac{S^2}{\cos. z^3 V \sin. z} (a+r) + \frac{r}{\cos. z} \text{ or } \frac{\sec. \times \tan^2 z}{V \sin. z} (a+r) + r \times \sec. z$$

Which may be thus expressed:

In an arch of uniform thickness, with a horizontal roadway, given the thickness of the arch and roadway; required the density in every part of the spandrel, so that the whole may be preserved in equilibrio.

To twice the log. tangent of the angular distance from the vertex, add the log. secant, and subtract the log. versed sine; take the corresponding number, and multiply by the thickness of crown; and add to this the secant multiplied by the thickness of roadway. These being express-

ed in terms of the radius, the resulting number gives the density in the spandrel, or proportion which the solid matter in measuring transversely across the arch bears to the whole breadth at the crown.

Accordingly, we have constructed the following short table from this formula. The first line shews the multiplier for the thickness at the vertex. The second shews that of the roadway; and is merely the table of natural secants.

5°	10°	15°	20°	25°	30°	35°	40°	45°
2.01916	2.07809	2.18140	2.33757	2.560742	2.87293	3.309600	3.92952	4.82854
1.00382	1.01543	1.035276	1.06418	1.103378	1.15470	1.220775	1.305407	1.414214

50°	55°	60°	65°	70°	75°	80°	85°	90°
6.18556	8.513614	12.000	18.84713	33.54315	91.40552	224.144	1649.6946	Infin.
1.555724	1.743447	2.000	2.366202	2.923804	3.863703	5.75877	11.47371	Infin.

As an example of the use of this table, let us take the thickness at the crown $= \frac{1}{10}$ of radius; and upon the supposition that the roadway, &c. is as thick as the archstones at the crown, we have, by multiplying as above directed, the following densities, viz.

at 5°	10°	15°	20°	25°	30°	35°	40°	45°
.25211	.25858	.26990	.28697	.31124	.34503	.39200	.45822	.55356
at 50°	55°	60°	65°	70°	75°	80°	85°	
.69634	.93853	1.30000	2.00302	3.50051	9.33374	22.70234	165.5432	

And if these densities be compared with those of line 11th, the reader will satisfy himself as to the value of the approximation which is there employed.

It would not be difficult, upon principles similar to the above, to establish a theorem for the elliptic, parabolic, and other curves, similar to that we have now given for the circle. But this is of less general use; and the limits assigned to an article of this kind, prevent us from entering at present upon an investigation, through which, perhaps, few of our readers would be inclined to follow us

VOL. IV. PART II.

Another opportunity may be found of offering this to the public notice.

But, in the meantime, the reader must at once see, that by this mode of expressing the density in the spandrel, the solution we have given applies to any form of roadway. All that is necessary, is to compare the densities in the table above given for a circular arch, with the relative height between the back of the archstone and the bottom of the roadway in the given design; and this will, we are sure, be more readily, and more satisfactorily done by the common builder with his sector

3 Q

and compasses, than by giving him equations for any number of figures of extrados.

We have arrived at a theory which is very nearly consonant with what has become, among our modern builders, the most approved way of distributing the weight over the haunches of an arch. It was customary, in the construction of bridges, to fill up the haunch with solid matter, such as gravel, earth, or the like, until a roadway of a proper slope was procured. Where the arches were small, this might not be attended with any perceptible bad effect, provided the archstones were of a good depth. But the necessity of lightening the haunches has been forced upon the attention of builders, whenever large arches have been attempted. A more remarkable instance of this we cannot have than in the bridge of Pontypridd, in Wales, built by William Edwards, a simple country mason of Giamorganshire. It is one of the boldest arches in Britain, perhaps even in Europe, being 140 feet span, and 35 feet rise; a portion of a circle of $87\frac{1}{2}$ feet radius, and the depth of archstones is only 3 feet.

In each haunch there are three cylindrical openings running through from side to side: the diameter of the lowest is nine feet, of the next six feet, and of the uppermost three feet; and the width of the bridge is about eleven feet. To strengthen it horizontally, it is made widest at the abutment, from whence it contracts towards the centre, in the old and unartificial way, by seven offsets, so that the roadway is one foot nine inches wider at the extremities than at the middle; and is also very steep.

That this mode of lightening the haunches is effectual, we have undoubted proof in the case before us. (Plate LXXXIII.) It is not ungraceful, but were it thought so, the tunnels might be concealed by the side walls. Indeed these tunnels might even become useful, by affording additional passage for the waters in dangerous floods, as seems to have been intended in the ancient bridge of Merida, the Pont St Esprit over the Rhone, and in many other similar structures both ancient and modern. Nevertheless we cannot approve of this mode. It seems to press unequally on the arch, and only at a number of detached points; and though the widest tunnel may be placed just where the greatest evacuation is necessary, yet this ill agrees with the gradual approximation to solidity, which we should find in passing down the back of the arch. To make correct workmanship in these tunnels is troublesome and expensive. The following mode, which has now become the customary practice of our most experienced bridge builders, is much preferable.

Thin longitudinal walls are built over the flank of the arch, parallel to the sides of the bridge, and about three or four feet asunder. The spaces between are covered at top with thin flat stones, or arched over by pointed or circular arches; or they are covered by regularly projecting courses in the way of an Egyptian arch; and in any case a platform is thus formed, upon which the gravel may be laid for a roadway.

In all probability, the first inventors of this mode of building, besides employing it with the view of equilibrating the arch by lightening the part over the haunches, had also an idea of steadying it by the lateral abutment. They appear to have considered these spandrel walls as a sort of hoops, that would keep the parts of the arch together, and hinder any stone from moving, by their great friction, inertia, and mutual abutment. Hence

various ingenious modes have been employed for locking them into the back of the archstones, propagating the pressure through, and securing them from sliding away at the bases.

They indeed act in this way; nevertheless the equilibration of the arch should be attended to in their construction, that every unnecessary strain may be avoided. The thickness of these walls may be varied indefinitely, and the vacant spaces made in any proportion to the solid parts. The walls ought to be near each other, that their effect may be felt over the whole arch, and perhaps they should spread out towards the bottom; but this is not so very necessary, for the courses of archstones *break joint* with each other, and the inequality of pressure in one course is immediately corrected by being propagated to the succeeding. We may determine readily the thickness proper for these walls, by the help of the table last given, provided we know the thickness of the arch, and of the roadway, (including the small arcade below it,) and the breadth of the whole structure. For example, let the breadth of the soffit be 20 feet, the thickness at crown $\frac{1}{10}$ of the radius, and the archstone alone $\frac{1}{8}$; being the same proportions as for the numbers in the example to last table. Then from that example we find the thickness of all the masonry in the spandrel must, near the crown, be $\frac{1}{2}$, or 5 feet; at 30° from the crown, it must be 7 feet; at 40° , 9 feet $4\frac{1}{2}$ inches; at 50° , 13 feet 11 inches; and at 57° or 58° , the whole must be solid masonry. Suppose, in the next place, that the side walls are 18 inches thick, and the spandrels 3 in number, of course there will be four openings. The thickness of each wall must be at 50° from the crown 3 feet 8 inches; at 40° , 2 feet $1\frac{1}{2}$ inches; at 30° , 1 foot 4 inches; and diminishing from thence to half that thickness. Perhaps eighteen inches is too thin for the side walls, but they may be thickened towards their bases, diminishing the thickness of the spandrels in proportion. On the other hand, nine inches appears too little for the spandrel wall, when we consider that an arch is to be built on it; but the height near the crown will be so small, that a little additional thickness there will be of no moment; nay, it will enable the arch the better to resist any overload at the crown.

We have now determined a method of constructing an equilibrated arch for sixty degrees on each side of the vertex; and this method, so far from having any thing unusual, is even strictly analogous to that which is adopted by the practical builder. Why then cannot we keep pace with him throughout, and give a construction for the entire semicircle? No difficulty is felt by the mason in that case. He constructs such arches every day. Nay, they are not only the most common, but the most ancient of all arches. But the reader must have ere now observed, that our theory is in this particular defective. The enormous expansion of the roadway, or the infinite height of superincumbent matter which it seems to require when the joints are nearly horizontal, are altogether preposterous and impracticable. We are sure they are unnecessary; for many semicircular arches have existed from the time of the Romans, and are still in good order. What is more, the failure of such arches near the springing, where they differ farthest from the theory, is a most unusual, and, indeed, unheard of phenomenon. Is our theory erroneous, then, or is it only defective? There is no reason for distrusting any of the consequences we have hitherto deduced. They are mathematically derived from an unquestionable princi-

ple, the action of gravity. But we have not yet considered all the causes of stability. The lateral resistance of the masonry, or other matter behind the arch, acts powerfully in preventing any motion among its parts, and, independently of that, the friction of the arch-stones, assisted by the cohesion of the cement, affords a great security to the structure. We have even seen a semicircular ring of stones, abandoned to itself without any backing, and stand very well; long enough, at least, to admit of the other work being leisurely applied to it. Here was no lateral pressure; no equilibration; why did not the lower courses yield to the pressure propagated from above, and slide off? It was only their friction that could retain them. It is greatly increased by this very pressure. And it is unquestionable, that a ring of polished blocks in that situation would not have hung together for a moment. The force of friction, therefore, makes so important a part of our subject, that it deserves a separate enquiry. Let us see how it may be estimated.

When a mass of matter is moved along other matter of the same kind, the resistance produced by friction has been usually stated at $\frac{1}{3}$ of the weight. That of free-stone, indeed, is supposed to be greater than $\frac{1}{3}$, perhaps it is $\frac{1}{2}$. And in the case to which we are going now to apply it, there can be little doubt, that, aided by the inertia of the stones, and the cohesion of the cement, the friction is even much more. But this force is inert; and we are at present enquiring, how far we are benefited by it in promoting the stability of our structure. It will, therefore, be proper to underrate it, at least until we discover how far we are warranted to say it must be beneficial.

Let LMN, Plate LXXXI, Fig. 3, exhibit the three sections (10° each) of an arch, which we may conceive equilibrated above the section L, or 60° from the crown. Draw LT , expressing the direction and magnitude of the ultimate pressure, perpendicular to the upper surface of L. In like manner rv is the horizontal thrust, and vl the weight of matter over L to the vertex. Draw the perpendicular ryb ; TL is the direction of the ultimate pressure when propagated to the lower surface of L; yl is its tendency to make L slide upwards along the joint. Now it is evident, that, if yl has to yr a less ratio than the friction has to the pressure, L will not move. Nay, what is more, L will itself have some weight. Take La to represent it, which, in the case of equal sections, is the tangent xx . Draw ra for the ultimate pressure in the lower surface of L, and ab for the force to be resisted by friction, in this case equal to .1343, or about $\frac{1}{7.5}$ of the pressure, and of course less than the friction, which will at least be one-third of the same.

Since L does not move upon the section M, they are to be considered as one solid mass, and we pursue the pressure through the section M. For this purpose, lay off ac for the weight of M, draw the perpendicular rd , and the parallel cd to the joint mo , cd is the force opposed to friction in that joint, and still is less than one-third of rd , the pressure being, in the case of equal sections, $\approx .2796$, or about $\frac{1}{3.6}$. Lastly, lay off ce for the weight of the lowest section N, and draw as before. It is evident, that cf , the force opposed by friction here, is just equal to rv the horizontal thrust, as might have been concluded without any investigation. In the case of equal sections, its proportion to ry or ve , the weight of the semi-arch or perpendicular pressure, is as .4425, or about

$\frac{1}{2.25}$, which is probably more than the friction will oppose without other assistance.

If, therefore, the friction on the horizontal bed at the springing be not equal to the thrust of the arch, we must increase it, as by dowelling it, for example, into the lower stones, or by backing it with other masonry, or by increasing the pressure on that joint, without altering the thrust of the arch, which may be done by thickening, or loading the arch just over the springing. And here the theorems for the extrados of equilibration come to our aid; for we see, that any quantity of matter may be laid over the springing courses, and far from disturbing the arch, it will tend to increase its stability. Indeed from what we have just said, it may be reasonably inferred, that the theorems for equilibration rather show the relative weights that may be laid on the different parts of an arch, without tending any where to disturb it, than those which must be laid on as necessary to its existence. The force of friction acts powerfully either way in preventing any derangement of the structure, and will therefore permit us to make with safety great deviations from the conditions of equilibrium.

It may not be improper to inquire, what are the conditions for equilibrating an arch by means of the friction of its segments alone,—that is to say, what are the alterations practicable in the position of the joints, or in the weights over the several sections, until the tendency of each section to slide is just balanced by the friction at its lower surface?

Whether we inquire into the position of the joints, or the weight that may be applied, there are two cases; for the friction being an inert force, will resist the stone in sliding either upwards or downwards.

I. Let it be required to determine the position of the joints in an arch, when each section is just prevented from sliding outwards by the friction at its lower surface.

Let the arch, Plate LXXXI, Fig. 4, spring from a horizontal joint, as nn , where, of course, the friction acting in vn , is just equal to the horizontal thrust, and must therefore have to tn' or vn the weight of the semi arch, the ratio which friction has to the incumbent pressure, say $\frac{1}{3}$. tn is the direction of the absolute pressure at the abutment nn . Take nm the weight of the section N, tm is the pressure on the joint of M, and making mtm similar to ntn' , mm will also represent the extreme friction in that joint, and tm its load, and so on successively. Wherefore, if tm , tl , &c. be found, the joints of the arch may be drawn at right angles to these lines respectively, and every stone will be exactly in the predicament of N, that is, just kept by its friction from sliding away.

The positions of tm , tl , may be readily discovered; for the angle $n'tm$ must be equal to ntm . If, therefore, we make ta equal to tn , draw the tangent aw , and making $ab = nm$, and joining rb , we have $atb = ntm$. And, in this manner, taking ab , bc , &c. for the weights of the successive sections from the scale, and drawing lines from t , the joints may be formed perpendicular to the lines thus drawn.

Upon the same principles, we readily find a construction for the extreme weights of the sections, when the positions of the abutments, &c. are given. This is so evident, that we shall not stop to point it out.

But a more convenient construction perhaps would be, to take the horizontal thrust, or quantity of friction

in the vertical line Cd , Plate LXXXI, Fig. 5. Lay off the weight of the semi-arch da , draw Ca , make Cx equal to it, also xz , mark off the weight of the sections along xz , and through the divisions draw lines from the centre; the joints required are parallel to these lines.

II. Let it be required, in the next place, to determine the other limit to the position of the joints, or that in which each section is just prevented from sliding in, by the friction on its lower bed.

Here it is evident, that as the friction acts precisely opposite to its direction in the former case, the joints may have, on the opposite side, exactly the same degree of obliquity to the position of equilibrium. Draw, therefore, the tangent vy parallel to ac , cut it with Cv equal to aC , lay off the weights of the sections along vy , and draw lines from C ; these lines will exhibit the positions of the joints, which of course may be drawn parallel to them. We have marked these two limits of position in three joints of the half arch above the same figure, assuming the friction at one-third, and taking the first section of 30° as equal to the thrust: and any other arch might have been introduced as well as the circular. Any of the lines in the triangle Cda makes, with the corresponding line in Cyv , or in Czx , an angle equal to aCx , that is, when the friction is one-third of the pressure, equal to $18^\circ 26'$; and when the friction is one-half, this angle is $26^\circ 34'$. The position of any joint, therefore, may vary in the former $18^\circ 26'$, and in the latter case $26^\circ 34'$, on either side of the position of equilibrium, before any sliding can take place among the sections. Nay, the friction of polished freestone is even more than one half, perhaps it is two-thirds of the pressure, which would give $33^\circ 4'$. And it is proper to observe, that this is not confined to the annulus of archstones, but holds equally with whatever weight the sections may be loaded. We may observe then, that in any arch, *the position of the joints may be varied about 20° , perhaps 30° from that of equilibrium, before any derangement can arise from the sliding of the archstones.*

This is a most important conclusion, and leads to extensive practical consequences. It affords a true explanation of the facility with which arches are every where constructed, even by the common country mason. The equilibration theory has shown us, that by adjusting the inclination of the joint to the weight of incumbent matter, we may suit an arch to any given circumstances; and we here find in the friction of the parts a powerful addition to its stability. We trust, therefore, that the reader now sees the propriety of the observation, which we made above respecting the inutility of searching very minutely into the exact position of these joints. It is in common cases scarcely possible to go wrong. But it must be observed, that the variation of position above mentioned, is to be reckoned from the position of equilibration, not from the common joints radiating all from one centre, or perpendicular to the curve, unless where such an arch is equilibrated by the superincumbent weight. For in an annulus of archstones, with radiating joints, which is the most common mode of construction, those towards the vertex can be drawn only a very little lower, and those towards the springing only a very little higher than the original centre, though either of them admits of a considerable variation in the opposite direction.

For this reason therefore we approve highly of the practice, which we believe is very general among arti-

ficers, we mean that of backing up the arch with solid masonry, for several courses above the springing. For granting that the friction on the horizontal bed be fully equal to the thrust, yet as the tendency to slide off is greatest there, it is well that it should be effectually resisted. This is readily done by the solid backing, which increases the mass of friction; and in the case of a bridge of several arches, enables us to set the contrary thrusts of adjoining arches in opposition to each other. The materials, therefore, in that part, ought to be laid close up to the spring courses, and also bonded into the inferior part of the abutment or pier, which will act as a sort of dowelling, and does not preclude the employment of that means also. If great security is thought necessary, cement, being a compressible substance, ought to be sparingly employed in the vertical joints at the back of the archstones.

The friction of the sections of the arch, as it permits a considerable variation to take place in the position of the joints, will also admit a considerable deviation from the load, which is necessary for equilibrium over any point of the curve.

It would not be difficult to investigate the extent to which this variation of weight might be carried. But we shall at present only remind the reader, that as we find a variation of 20° practicable in the position of the joints, he may conclude, that each section will admit of its load being altered to that which would suit a point in the curve 20° on either side of it.

But in speaking of this alteration of weight, it must be observed, that we consider it only so far as it is likely to cause the sections of the arch to slide on each other. If the overload be considerable, or if the arch be thin, and of course flexible, a deviation from equilibrium may produce an effect equally destructive with that which would arise by the sliding of the sections. Suppose this deviation to consist in overloading the crown, a case very likely to occur, for even the variable pressure of a loaded waggon bears, in some cases, a very sensible proportion to the weight at the vertex of the arch, this overload will be equivalent to a greater thickness of crown, and of course will sensibly increase the horizontal thrust, while the total weight of the arch, or vertical pressure, is much the same as before. This is a still stronger reason for backing up the spring courses with masonry; for unless the stones, where their joints become nearly horizontal, be sufficiently steady, they may, by the increasing thrust, be pushed along their beds; for they are already near the limit of steadiness from friction: a very short slide will open the joints towards the crown. The same thing will also be produced by the compression of the cement in the arch. The vertical sections will descend. They already tend strongly to do so. The separation of the sections on each side of the vertex is equivalent to drawing their joints to a lower point than before. This will again increase the horizontal thrust.

We have seen, that these joints are already too low for equilibration in a common circular arch. The motion of the lower sections, therefore, if once begun, will go on increasing, until the arch falls to pieces. But what is perhaps of more importance, as the joints towards the crown will now open below, and the sections, not being in entire contact, will hang by their upper corners only, these may chip and crumble away, thereby forming them into more acute wedges, and giving us a new cause of destruction. For though the cohesion of the

matter of the archstone may effectually resist the tangential pressure, when distributed over a joint of considerable superficies; yet when the whole of that pressure is condensed into a small compass, or a mere point, and that near the edge, and acting perhaps in a very unfavourable direction, since the friction permits it to act with great obliquity, its destructive tendency may be irresistible.

Suppose a motion of this kind actually going on in an arch, as is generally the case when the centre or scaffolding is taken from below it, How is it to be prevented? We answer, not easily: For though the motion be exceeding slow, or almost imperceptible, yet the quantity of matter is so enormous, that its momentum is great. Nothing, therefore, but the most solid work could resist it. Accordingly, in striking the centres of an arch, the whole is not taken away at once. It is not likely that any arch could withstand that treatment; but the centre is gradually let down, stopping now and then until the work settles. It does so first at the springing and haunches, and the crown of the arch is the last part that departs from the centre. It appears, therefore, that every arch is a segment of a greater circle, after it is finished, than before. Allowance should be made for this in the design, and in calculating the weights necessary for equilibrium from the horizontal thrust. An attempt is sometimes made to remedy this change of figure, by driving down the key stones. And though it is far better to render such expedient unnecessary by careful workmanship, yet this method is not to be despised. It seems to have been the common practice of the ancient architects. An overdriven key-stone, or console, as it is termed, is one of the most usual ornaments of the archivolt. Nevertheless, even when this expedient is thought necessary, it should be employed with great caution. Wedges of small taper have great power. And the horizontal thrust should be in no case increased, without very weighty reasons.

Suppose the arch to descend somewhat at the crown, the stones there will hang by their upper edges, even when there is no apparent opening on the lower side of the joint. They will be pretty close for a good way on each side, so far indeed as the equilibrating superstructure extends, or to about 60° . And it will then be tolerably well equilibrated, even though the superstructure should not be yet applied. For the arch being then at the crown, the theoretic extrados will run further down on the back of the curve, ere it turns up again; and, of course, will for a good way not differ much from the back of the archstones. But beyond this point, or about 60° from the crown, things are not likely to be so steady. We do not say, the lower sections will slide: their friction is likely to prevent that. But the best workmanship cannot prevent them from *rocking* a little. At least, the sum of the motions of each joint will at length come to be something. The haunches will slip away a little, just where the equilibration ceases. The circular arch will become somewhat elliptic. The joints about that point will open behind; and if the case be dangerous, the stones will chip away below. Something of this kind, indeed, goes on in the building of every arch. As the courses approach the crown, their thrust makes the lower ones recede a little from the centre. But as the process is gradual, and the finishing courses are adapted to the shape of the opening which receives them, perhaps the only bad effect is the derangement of the crystals of lime, which have already

begun to form, while the cement fixes in the lower joints of the arch. With good workmanship, the amount of the final derangement is so small, that no joint is opened beyond the limit at which repulsion acts, especially in such great pressures; so that every stone may be still considered as butting pretty fairly on its neighbours.

Having now exhibited the effects that may be expected from the friction of the parts of an arch, one thing only remains to be considered in this department of our subject, which is, the lateral pressure likely to arise on the back of the arch, from the materials employed to raise the structure to the horizontal line.

If the materials employed here be only a solid mass of masonry, it is not easy to see, every thing being steady, how it can act in any other way than in the vertical direction. If, however, a motion takes place in the arch, the mass of materials lying nearly over the springing, when the arch is not very different from a semicircle, will have such an enormous friction, if well built and bonded together, as would appear equal to the resistance of any pressure that is likely to be opposed to it. And when the arch is a segment much smaller than a semicircle, the rules we have already given for its equilibration must be considered. But, instead of solid courses of masonry, the haunches of arches are often filled up with coarse gravel or shiver, and sometimes with mere earth or sand. Materials of this description does by no means act by mere dead weight. It has a tendency to slide down towards a horizontal position; and, of course, possesses, in some slight degree, the *quaguaversum* pressure of a fluid. This may act on our arch in a manner altogether new, and produce strains for which hitherto we have made no provision. We shall first consider the back of the arch as filled up with a fluid substance, as water. The pressure in every part will be in a direction perpendicular to the curve, and will be proportional to the depth. A pressure perpendicular to the curve will be equivalent, in effect, to a vertical pressure, which exceeds it in the ratio of the secant of the inclination to the vertical. Of course, the pressure at the springing, when all is equilibrated, must be equal to the horizontal thrust in a semicircular arch.

Take the thickness of matter at the crown $= \frac{1}{m}$ of radius, the weight of one degree $= k$, then the horizontal thrust will be $57\frac{1}{2}k$, and the height of fluid necessary for this will be $57\frac{1}{2}$ times the thickness at vertex, provided the specific gravity of the fluid be the same with that of the arch. But if not, let $f =$ the gravity of the fluid, and $S =$ that of the arch at vertex, then $\frac{57\frac{1}{2}SR}{fm}$ will be

the height required. Suppose the arch made of brick, which is about double the specific gravity of water; and we have, for water filling up the flanks, till just covering the crown of the arch, a depth at the springing nearly equal to the radius; and, of course, the thickness at crown should be about $\frac{1}{12\frac{1}{2}}R$, or $\frac{1}{12\frac{1}{2}}$ of the span, when in equilibration at the springing. We take no notice of the effect of the arch in assisting this. Water, therefore, is much too light for equilibrating an arch at the springing, in any moderate thickness of crown. It might, however, be so employed. The quantity requisite is always finite, even at the vertical spring courses; and by expanding the arch, or otherwise employing its hydrostatical properties, the requisite weight

of fluid could without doubt be obtained in any case. But it is unnecessary to pursue this speculation farther than merely to observe, that its weight on the arch, where a variation is requisite, might be adjusted, by attending to the modes of altering the density which we have noticed, when speaking of filling up the arch by masonry alone.

Though the action of sand, gravel, or mould, in situations such as this, be not exactly the same with that of water, in following the laws of hydrostatical pressure; yet these materials resemble water, and may be conceived to hold the middle place between the fluid and the solid backing. In some respects they are more advantageous than the fluid. They are stiffer, so to speak, affording a lateral abutment to the arch, if it is likely to yield; and as the parts have a great friction among themselves, it will require a much greater pressure acting horizontally, to make the matter rise, than in the case of a fluid. We must not, however, be too confident. Materials of this kind are compressible; and we have already seen, that very slight shifts are attended with dangerous consequences. At the same time, we need not be much afraid of a trivial departure from exact equilibration; for it is not likely that materials of this kind will act with the powerful effort of hydrostatical pressure.

But there is another case, where matter of this kind is likely to be attended with more pernicious effects than even a fluid of equal density would be. We mean, when the back of the arch, is gorged up with water from land floods, if the backing be open gravel, or shiver, we have superadded to its weight that of the whole quantity of water admitted into the structure. This, even if it acts equally on both sides, must be a dangerous experiment on any arch; but where it is confined to one side, as is generally the case, and between lofty side walls, the effects are likely to be serious indeed. Accordingly, the builder forms gutters in the side wall to let off the water ere it collect. A practice which is in general highly useful; but which, in the case of sand, clay, or mould, is of small service. The water enters into such matter by its capillary attraction; and fills it to the upper surface in spite of our gutters. It of course expands it, and this with a force which we cannot measure, but which we are sure is very great. Here the friction of the parts, which was so useful in the former instance, proves extremely hurtful. For as the matter cannot easily rise, and probably the adhesion of its particles is increased by the water, the expanding force becomes an enormous hydrostatical pressure acting perpendicularly on the side walls and extrados of our arch, and which in all probability they may not sustain.

We do not mean to pursue the theory of the pressures exerted by these semifluids any further at present. We look upon their use in this case as radically bad, and would recommend its discontinuance. If the reader wishes for more information on the subject, he will find it when we come to speak of retaining walls. In the meantime we may remark, that the dangerous consequences of this mode of backing are, in some degree, prevented by ramming the layers of matter, especially if it consists of mould or the like; or by puddling them so as to form a mass impervious to water. And here we should observe, that as this ramming will produce an extraordinary lateral pressure, we must attend to equilibration, as we rise along the arch, and secure the

side walls, by thickening them below, or curving them horizontally or vertically.

The thickness of the archstones is an important department of the theory of arches. It is natural that we should endeavour to make them as small as possible. That will diminish the expense of the structure, lessen the pressures in the arch, and increase the security at the springing. But there is an evident limit to this diminution; for though we take every pains to render the joints close, the stones may come at length to be so small as to crush by the thrust of the arch. This is, indeed, a curious branch of enquiry. It depends intimately upon the corpuscular actions of the particles of stone; a subject on which, we regret to say, that our information has been hitherto very scanty. The writers of this article have, at present, a series of experiments in some forwardness, which will throw much light on this, as well as on many other departments of architecture. Meanwhile, that we may not disappoint the reader by leaving the subject untouched, we shall endeavour to draw some information respecting it, from the present state of our knowledge, and the dimensions of structures already existing.

The question evidently depends on the amount of the tangential pressure. At the crown this is the horizontal thrust. We shall suppose all the joints to be duly drawn to equilibration, the sections fairly abutting on each other, and no weakness arising from acute angles.

Stone, it is said, will carry from 250,000 to 850,000*lb.* avoirdupois per foot square, and brick 300,000*lb.* They have been made practically to carry $\frac{1}{2}$ of this, and even more. The pillar in the Centre of the Chapter House at Elgin carries upwards of 40,000*lb.* on the square foot, and there was formerly a heavy lead roof on it. It is a red sand stone, and has borne this pressure for centuries.

We shall therefore take 50,000*lb.* per foot as a load, which may be safely laid on every square foot in the arch. A cubic foot of stone weighs about 160*lb.* per foot; and brick weighs less. Suppose, therefore, the arch to be one foot thick at the crown, and the key-stone one cubic foot, it will bear a horizontal thrust of 50,000*lb.* that is, $312\frac{1}{2}$ times its weight.

But, $50,000 : 160 :: R : \text{Tang. } 11' 0'' 3'''$, which will be the angle of the key-stone in that case. So that an arch of $312\frac{1}{2}$ feet radius, or a semicircular arch of 625 feet span, might bear to have a key-stone of a foot deep, without risking its being crushed more than in structures which have already stood for many years. And this may be called the limit of stone arch building; for if we double the depth of the stone, we will thereby double the weight also, and its ratio to the horizontal thrust will still be the same. Indeed this limit does not much exceed what has been actually executed. A considerable portion of the bridge of Neuilly is an arch of 250 feet radius; and Gautier mentions a platband in the church of the Jesuits at Nismes, the camber of which, after settling, would make it a portion of an arch of 280 feet radius. The length or span is $26\frac{1}{2}$ French feet, the rise only 4 inches, and therefore the diameter of its circle would be 560 English feet.

This singularly bold platband was made under the conduct of Pere Mourgues, after the design of Cubisol, an able architect. The stones are 1 foot thick, their depth is 2 feet towards the key, and 2 feet 4 in-

ches at each end. It had a camber given it of about 6 or 7 inches, and descended near 3 inches on striking the centres. (*Gautier*.)

We see, that the horizontal pressure does not determine the vertical thickness of the arch-stone. But as we pass down the arch, it is plain that the butting surfaces must increase, in proportion to the increasing tangential pressure.

At sixty degrees from the vertex, granting that the arch is equilibrated, the depth of the arch-stones must be doubled; and though the equilibration be carried no farther, yet, at the springing or horizontal joint, a small increase will still be necessary. The ratio will soon be found. To the square of the weight of the semi-arch, add the square of the horizontal thrust, the square root of the sum is the pressure at the springing. If we divide this by the horizontal thrust, it will give the thickness at the springing, compared with that which is necessary at the crown. Or if we divide it by $312\frac{1}{2}$, it will give the smallest depth of joint which should be used at the springing. The thrust and weight are supposed to be given in solid feet. If given in pounds, divide the above quotient by 160, or divide at once by 50,000.

Example. Required the thickness of the lower joints for a semicircular arch, when the weight of a section of a foot in breadth from the crown of the arch to the springing is 60,000*lb.* and the horizontal thrust is 20,000*lb.* which answers nearly to a 60 feet arch, 4 feet thick at the crown.

60	20	50,000	63,250
60	20		1,265 feet,
3600	400		or 1 foot $3\frac{1}{2}$ inches nearly; of
400			course the vertical section, or
4000(63.25			key stone, might be only
36			$\frac{39999}{31250} = \frac{3}{4}$ of a foot, or $4\frac{1}{2}$ inches, if it were necessary so to
123) 400			reduce it.
369			
310 &c.			

For another example, take a 50 feet arch, having 5 feet thickness at crown. The semi-arch may be found sufficiently near, by multiplying the half span into the half height to the road, viz. $25 \times 15 = 375$. And the horizontal thrust $5 \times 25 = 125$ feet of stone, $375^2 = 140600$, $125^2 = 15625$, their sum is 156250, the square root of which, divided by $312\frac{1}{2}$, gives 1.265, or 1 foot 3 inches; and here again the vertical section might be $\frac{125}{312\frac{1}{2}}$, or $4\frac{1}{2}$ inches only.

If we calculate upon the same principles, the depth of arch stone at the springing of a semicircle of 100 feet span, 10 feet thick at crown, we shall find it to be 5 feet, and at the crown the depth may be 19 inches. In the great arches of the bridge of Neuilly, the thickness at the crown is about 4 feet 8 inches, the span 128.2 feet, and height 32. The horizontal thrust is great, the crown being drawn with a radius of 150 feet; consequently this arch would require a depth at springing of about 4 feet. But when the centre was struck, the crown of this arch descended 23 inches, which has rendered it a portion of a much larger circle, and has greatly increased the horizontal thrust. After all, the pressure at the springing is scarcely greater than in the last example, and the depth of joint there need not have exceeded five feet. It is nearly three times that, and

even at the crown the thickness is $\frac{1}{4}$ greater than the increased thrust would require. We trust, therefore, that, in spite of the great risk this singular arch has run, it may yet long remain a monument of the skill and boldness of the able architect who designed it.

It may be proper to observe, that the French architects Perronet and Soufflot, made an experiment on the strength of the stone of which it was composed. They found, that a cubic foot of it, which weighs 152*lb.* required 240,000*lb.* to crush it. In the above investigation we have only taken it at 50,000.

The thickness at the crown of the arch, cannot, with propriety, be reduced so much as we have supposed in the above examples. This part of the structure is liable to be strained transversely. And it has been found, that when stone, or other matter, is bearing a great pressure longitudinally, its strength against a transverse strain is thereby much diminished. But, independent of that, there is another cause for preserving the crown of a greater thickness. The varying pressure of carriages would be apt to produce some motion among small stones; this would chip away their angles, and accelerate the destruction of the building. But there is seldom any need for this reduction. In most cases, it would only be additional labour.

OF PIERS.

The piers and abutments of a bridge must be so constructed, that each arch may stand independent of its neighbours. For though, by the mutual abutment of arch against arch, the whole may rest upon very slender piers, if once the structure is erected; yet, as they must be formed singly, and are exposed to many accidents, it will be best to contrive them, that the destruction of one arch may not involve in it that of the whole.

Some of the writers, on the principles of bridges, in treating this department of their subject, have found it necessary, by the help of the higher calculus, to find the centre of gravity of the semi-arch. The solution of the problem, we are convinced, so far as it is useful in practice, lies much nearer the surface.

The reader has already frequently seen, that the ultimate pressure may, in every case, be reduced to two others, viz. the weight of the semi-arch above, and the horizontal thrust. In the equilibrated arch, this pressure is directed perpendicularly to the joints of the sections; and these being usually drawn at right angles to the curve, the pressure is in the direction of the tangent to the arch. Hence, we have often called it the tangential pressure. Upon this principle, however, when the curve springs at right angles to the horizon, an infinite pressure is required in the vertical direction,—a supposition which cannot have place in practice. We must accordingly call in the assistance of friction in that case; a force which may be set in opposition to the horizontal thrust, and which, increasing with the superincumbent weight, very fortunately keeps pace also with what it is intended to oppose.

Granting, then, that the friction is so contrived, upon the principles already explained, that there is no danger of any slide at the horizontal or springing joint; it will be readily admitted, that no slide is likely to take place in any horizontal course below that, till we arrive at the foundation; for the disturbing force is constant, but the friction increases as we descend. Our principal care then must be, that the pier does not overset, by turning

on the farther joint E, Plate LXXXI. Fig. 6, of its base, as a fulcrum. Take a in the horizontal joint, A as the centre of pressure. Draw aV to represent the weight of the semi-arch, and VT the horizontal thrust; then Ta is the ultimate pressure: and if, when produced, it falls within the base of the pier, it is perfectly obvious that it can never overturn it. And this is altogether independent of the weight of the pier; for if that were a mass of ice, immersed to the springing in water, the case would be exactly the same.

But the pier itself has a considerable stability, arising from its own weight; and even though the direction of the ultimate pressure of the arch alone pass out of the base, the tendency to overturn the pier may be balanced by its weight. This weight may be supposed concentrated in the centre of gravity of the pier, and of course to act in the vertical line which bisects it.

Its effect will be nearly found by laying off in that line from the point q , where the direction of the ultimate pressure of the arch intersects it, $qr =$ to the weight of the pier, and taking $qs =$ the ultimate pressure $= aT$, and completing the parallelogram, the diagonal drawn from q will represent the direction and magnitude of the united pressure of the arch and pier. This is not strictly accurate; it would be so if a and q coincided, which is the case with a single arch standing on a pillar: but in general, the ultimate pressure is still more favourable than this. Its direction at any point is in the tangent of a curve, which approaches the vertical as we descend, since the proportion arising from the weight of the pier increases with its height.

In order to find analytical expressions for these forces, let the horizontal thrust of the arch $= t$. The weight of the half arch $= a$, and that of the pier $= h$, the height of the pier to the springing of the arch $= h$, the breadth at the base $= b$.

1. Then the horizontal thrust acting in AG , tends to overturn the pier, and its force round the fulcrum E will be represented by multiplying it by the perpendicular distance $AD =$ viz. $h \times t$.

2. The weight of the pier acts in the direction BC , and its effect will be represented by multiplying it by the leverage CE , viz. $h \times \frac{1}{2}b$.

3. The arch acts with the leverage EK , which is not equal to the breadth of the pier, by the part $KD = AH$, say $\frac{1}{2}$ of the depth of the joint at the springing. This will never exceed one-fourth of the breadth, when two different rings of arch-stones rise from the same pier, unless the pier widen below. Call EK , therefore $= \frac{3}{4}b$. We have now $ht = \frac{1}{2}bh + \frac{3}{4}ba$; whence,

$$1st, b = \frac{ht}{\frac{1}{2}h + \frac{3}{4}a} = \frac{4ht}{2h + 3a}, \text{ and consequently,}$$

To find the least breadth of the pier at its base, divide the horizontal thrust by half the pier added to three fourths of the half arch. Multiply the height of the pier by the quotient.

$$2d, h = \frac{b(\frac{1}{2}h + \frac{3}{4}a)}{t}, \text{ that is,}$$

The height of a pier to the springing, having a given base and weight, is found by adding the half pier to three fourths of the arch, multiplying by the breadth of the base, and dividing by the horizontal thrust.

$$3d, h = \frac{bt - \frac{3}{4}ba}{\frac{1}{2}b} = \frac{2ht}{b} - 1\frac{1}{2}a;$$

or the weight of the pier cannot be less than the excess of the horizontal thrust multiplied by twice the height of the pier, and divided by the base, above one and a half times the semi-arch.

In the above determination it may be observed, that we consider the weight of the pier as independent of its base. Now, though it may be said with propriety, that the weight of the pier cannot be known until we know its thickness, which is the very thing sought, yet a little consideration will shew, that we may give different magnitudes to piers which have equal bases, and that, either by altering the outline of their sides, the density of their structure, the gravity of their materials, or the weight of solid matter over them, we may therefore, when the base is given, apply the weight necessary to keep the pier in equilibrio, provided this does not require the pier to be any more than a solid mass up to the roadway. Should the base assumed admit of the pier being much less than the solid parallelopiped, we may diminish it in various ways; as, 1st, By opening arches over the pier, where, in case of floods, we will procure an addition to the water-way; a practice very usual in the ancient structures: or, 2d, By tapering the pier towards the springing of the arches, or by making each pier only a row of pillars in the line of the stream, arching them together at top; a mode which may perhaps be objectionable in a water-way, but which would have a very striking and light effect in land arches. Something of this kind has been done by Perronet at the Pont St Maxence.

When piers indeed are to be exceedingly high, as in the columns which are sometimes employed in supporting a lofty aqueduct, the best way is to make them hollow, and give them stability, by enlarging the base. They will, in that case, press less on the foundations, be less expensive, and they may be greatly stiffened by hooping.

Indeed it is not usual to make piers solid all the way up to the road; the spandrel-walls are carried back so far as to unite with those of the neighbouring arch, are locked together by a cross wall just over the middle of the pier, having also walls longitudinally, and the whole arched or flagged over from spandrel to spandrel just under the roadways.

Nevertheless, as the case of solidity will enable us to assign a limit to the breadth of piers, which it may be proper to be acquainted with, we shall proceed in that investigation.

The weight of the pier in that case will be as the rectangle under its height and thickness, expressing the weight of arch and pier by the cubic feet of stone. The pier indeed will be somewhat more; for the sterlings, or breakwaters, at each end, will add something to its stability; and this will be still further increased in proportion to the horizontal push, if the whole bridge be wider at the foundation than at top, as is very common. Excluding these collateral advantages, we shall consider the whole as rectangular, and then the stability may be found in the longitudinal section. We have already

$$b = \frac{ht}{\frac{1}{2}h + \frac{3}{4}a}, \text{ and in the case of a parallelogram}$$

$\frac{1}{2}h = \frac{1}{2}b(h+c)$, c being the height from springing to the roadway. By substitution there arises $\frac{1}{2}b^2(h+c) + \frac{3}{4}ab$

$=ht$; and by resolving this quadratic equation, we have

$$b = \sqrt{\frac{2ht}{h+c} + \left(\frac{3a}{4(h+c)}\right)^2} - \frac{3a}{4(h+c)}$$

or thus, $b = \sqrt{\frac{2(h+c)ht + \frac{3}{4}a^2}{h+c}} - \frac{3}{4}a$ as a formula

for the thickness of solid piers to support equilibrated arches; and it must be observed, that if the arch be understood to act otherwise than at $\frac{3}{4}$ the thickness of the pier, this coefficient may be altered accordingly.

As an example of the use of the above, take an arch of 100 feet span, six feet thick at the crown and semi-circular. The horizontal thrust is $6 \times 50 = 300$ cubic feet; and let us take the weight of the half arch as $=1200$ at a medium, since, on account of the open spandrel, it may be considerably varied. Suppose the arch sprung at 18 feet high, then $h+c = 74$, $\frac{2ht}{h+c} = \frac{2 \cdot 18 \cdot 300}{74} = 146$,

$$\text{also } \frac{3 \cdot 1200^2}{4 \cdot 74} = \left(\frac{3a}{4(h+c)}\right)^2 = 147.93,$$

$$\text{and } \sqrt{146 + 147.93} = 17.14,$$

from which subtract $\frac{3a}{4(h+c)} = 12.17$, we have 4.97, or

5 feet nearly, for the thickness of the pier, which is not one-twentieth of the span. In an example nearly the same as this, 13 feet has been given by an eminent mathematician for the thickness of the pier; but the reason is, that the stability which the pier derives from the superincumbent arch, has not been taken into consideration; an oversight the more extraordinary, since it is evident, that unless this weight did bear completely on the pier, it could have no tendency whatever to overturn it.

Suppose that c in the above formula is $=0$, or, what is the same thing, that the pier is carried no higher than the springing,

$$\text{we have } b = \sqrt{2t + \frac{3a^2}{4h}} - \frac{3a}{4h}$$

And in an arch of the above dimensions,

$$2t = 600, \quad \frac{3a}{4h} = \frac{3 \times 1200}{4 \times 18} = 50, \text{ when squared} \\ = 2500$$

$\sqrt{3100} - 50 = 55.68 - 50 = 5.68$ nearly, or about a seventh part more than the former. We see therefore how little the stability may depend on the mere weight of the pier.

We may have a proof of the accuracy of this determination, by comparing it with the formula first given

for the thickness of piers, viz. $b = \frac{ht}{\frac{1}{2}h + \frac{3}{4}a}$, ht , or the overturning force, will be $300 \times 18 = 5400$. The pier in the first case, taking it at 5 feet, will be $5 \times 74 = 370$, and $\frac{1}{2}h + \frac{3}{4}a$ will be $185 + 900$ or 1085; multiply this by 5, we have 5425, a little more only than the overturning force, as the thickness was taken at 5 feet, which is a little in excess. The reader, if he chooses to go through the calculation for himself, will find 4.97 agree exactly.

In the second case, the pier $= 5.68$ nearly, $\times 18 = 102.24$, and its half $= 51.12$, which added to 900, and multiplied by 5.68, gives 5402.3. A trifle in excess, because 5.68, like the former, is only an approximate number.

The weight of the pier in this case making so small a part of the whole resisting force, we may readily believe, that its total immersion in water would make no

VOL. IV. PART II.

great addition to the requisite thickness. Stone, when so immersed, loses about $\frac{2}{3}$ of its weight, being in specific gravity about $2\frac{1}{2}$ times that of water; and, in the above example, were the whole pier under water, it ought to be about a fiftieth part thicker.

We have hitherto supposed the arch equilibrated, at least as far as is conveniently practicable, in which case the horizontal thrust is represented by the rectangle under the radius and thickness at crown. But if the equilibration of the arch has not been attended to, we must consider whether any uncommon weight about the shoulders may not produce, by the help of friction, a thrust in the arch fully equivalent to what would arise from a greater thickness at the crown; and our calculations are to be regulated accordingly.

On the other hand, we have given the arch a weight in the above example which is nearly that of solidity. But in general the arch weighs much less. The most common case, where the stability of the pier is any way doubtful, is when it carries no more than the ring of arch-stones, and before it is assisted by the weight of the superincumbent backing. The weight keeping the pier steady, is now much diminished; while the horizontal thrust is unaltered; for, if not propagated by weight, it is by means of the friction of the sections propagated to the pier, so as to act against it in the same manner as if completed.

Now, as it is by no means likely that the arch will be made thinner at the spring-courses than at the crown, while any additional thickness of the former is always in favour of the piers, we shall proceed upon the supposition, that a regular annulus, or ring of stones, is laid on them every where of equal thickness. Suppose this thickness, as before, to be six feet. In that case the semi-arch of the above dimensions

$$\text{measures } 499.5, \text{ or } 500 \text{ feet, and } \sqrt{2t + \left(\frac{3a}{4h}\right)^2}$$

$$= \frac{3a}{4h} = \sqrt{600 + \frac{1500^2}{4 \cdot 18}} - \frac{1590}{4 \cdot 18} = 32.13 - 20.83, \text{ or}$$

$11\frac{3}{10}$ feet for the breadth of the pier. But it is by no means likely that the arch would have 6 feet thickness of crown in these circumstances; 2, or at most 3 feet, would, in all probability be thought sufficient for a depth of keystone; and a ring of arch-stones 2 feet deep will require a pier of 9 feet only. If we build up the pier behind the springing for about 6 feet, this thickness may be reduced to 8 feet; and it will be absolutely necessary to do so in a case of this kind, to prevent the lower sections of the arch from sliding away.

The above example is taken for a semi-circular arch; and though the reader must see, that the thickness of the pier is in no certain proportion to the span, it is nevertheless obvious, that those writers who derive it from that, have hitherto erred considerably in excess. It is usually stated at $\frac{1}{4}$ for semi-circles; but we see, that in the most unfavourable circumstances, it need not exceed $\frac{1}{4}$ of the span, and may often be made much less. This, however, we state with limitation, referring to the height of pier above given; for were the pier much higher, it must be made thicker; if the pier be infinitely high, the weight of the arch sinks into insignificance, and the thickness, $= \sqrt{2t}$, which in the above arch 6 feet thick is $= 24\frac{1}{2}$ feet nearly, and in general, if the thickness at crown $= \frac{1}{n}$ of radius, then $\sqrt{2t} =$

3 R

$\sqrt{\frac{2r^2}{n}} = \sqrt{\frac{2}{n}}$, that is, taking s the span, $m=2n$, the thickness $= s \sqrt{\frac{1}{m}}$; whence this rule for the thickness of a pier of infinite height. Find what part the thickness at crown is of the span, extract the square root, and multiply it by the span for the thickness; or thus, multiply the diameter by the thickness at crown, and extract the square root.

One of the loftiest bridges with which we are acquainted is that of Alcantara, over the Tagus, in Spain. It is stated by Don Antonio Ponz, in his *Viage d' España*, to consist of six arches, the two largest 110 feet in span, the water at the lowest is 42 feet deep; from the surface of which, to the beginning of the springing of the middle arches, 87; and from thence to the upper surface, 76; which, with the 4 feet and a half of parapet, make the whole 205 feet and a half, (more correctly, 209½). Taking then the thickness at crown as equivalent to 16 feet, and the diameter 110, the thickness for an infinite height should be 42 feet. They are 38 in thickness, and 129 feet high. Let us now try this thickness by the general formula given in the earlier part of this section.

The lower or immersed part 42 feet high, and 38 broad, is 1596; but of this $\frac{3}{4}$ are to be deducted on account of the immersion, leaving for that part 958. The pier from thence to the springing is 87 by 38, or 3306. We must suppose such a pier built up between the arches to at least $\frac{1}{2}$ of the height, or about 20 feet; but on account of a set off which appears in the design, we shall suppose the breadth still 38 on an average, which makes 760, and the whole pier 5024, and its half is 2512. To this add $\frac{3}{4}$ of the semi-arch; say $\frac{3}{4} \times 55 \times 16 = 660$, and we have 3172. By this number let us divide the product of the horizontal thrust and height of pier, that is, $16 \times 55 \times 129 = 113520$, and we find about 36 feet, very near the actual breadth. Are we to look upon this near coincidence as the effect of chance, of science, or the habit of the builder? We rather think of the first.

When the arch is a segment less than a semicircle, a greater thickness of pier becomes necessary. For the span continuing the same, we must either make the arch a part of a circle of greater radius, which would increase the horizontal thrust, or we must, in order to obviate that, diminish the thickness at the crown. In either case the weight of the arch is diminished, and with it the assistance which it gives to the stability of the pier.

Take a segment of 100 feet span and the versed sine 40, and suppose the pier 18 feet high, and the arch 6 feet thick in the crown, as in last example. The radius of this arch will be 51.25, and the thrust 307.5. The weight of this arch will be less than the former; let us take it at 110.0, and if the calculation be completed, as in the first example, the thickness of pier will be found $= 5.35$ feet.

But suppose the pier carried no higher than the spring and ring of archstones, six feet thick, firmly bonded into it. The half arch will be 443 cubic feet; the thrust will remain as before; and from the formula

$b = \sqrt{2t + \frac{3a^2}{4h}} - \frac{3a}{4h}$, we have for the thickness of the pier 13.35 feet.

And for a ring of stones 2 feet thick, we have 9.35 feet only.

As another example, take a segment of 100 feet span with a rise of only 25 feet, or, in other words, an arch of 120 degrees, let the height of the pier and vertical thickness be as before. The radius will be $65\frac{1}{2}$ feet, and the thrust, where the crown is 6 feet thick, will be 393, taking the half arch at 775; we have for the pier 7.46, and a similar increase becomes necessary in the other cases.

If the versed sine of the same arch be reduced to 10 feet, the radius is then 130 feet, and thrust $= 780$, the arch being taken as every where 6 feet, we find very nearly 40 feet as the thickness of pier: it will be exactly 40 feet if a horizontal arch with joints drawn to a radius of 130 feet be introduced in its stead. The enormous thickness of pier which becomes necessary for these flat segments, precludes, in a great measure, the possibility of employing them in practice; and indeed we do know, that a horizontal arch of 100 feet must be, in a great measure, a visionary structure.

There is an interesting subject of enquiry, which might not be unappropriately noticed here, we mean the lowest versed sine that can be used for arches in proportion to the span. We conceive this, however, as in a great measure a practical question. We have already given some idea of the greatest possible arch of stone or brick; a segment of that circle may, of course, be employed in any situation, but the piers (if the arch be of considerable span and height to the springing) must be made very great. Indeed the investigation depends intimately on the thickness of piers. We ought to know the dimensions of the largest pier that can be trusted, and this, we conceive, depends chiefly on the care of the mason; for stone, and especially cement, is a compressible substance; and when an arch is very flat, a very small yielding at the springing produces an enormous depression at the crown, insomuch that there may be reason to dread, lest the arch pass down below the horizontal line, and fall to pieces before the stability of the abutments can be acted upon. A compression in the joints is equivalent to a yielding at the abutments, and appears equally difficult of remedy.

In great horizontal thrusts, where the segment is flat, the immersion of the pier in water comes to have an important effect. On the weight of the pier, in those cases, the stability chiefly depends, and a deduction from that of two-fifths must be compensated by enlarging the thickness. For example, in the arch of 100 feet span, with 25 feet rise, and piers 20 feet high, the ring of stones of 3 feet at the crown may be set on a pier of 14 feet broad, taking the half arch at 180 feet. But if the pier be set in water to the springing, it will lose $\frac{2}{3}$ of its weight; and its breadth must be increased nearly to $16\frac{1}{2}$ feet ere it has the same degree of stability as before. The truth is, that in this case the stability derived from the pier itself is nearly as much as that derived from the arch, (conceiving this always concentrated in the middle of the half of the pier,) a diminution of $\frac{2}{3}$ from the pier, therefore, is $\frac{1}{3}$ of the whole, and must be provided for by an increase of breadth, not just equal to $\frac{1}{3}$; for we must observe, that the stability derived from the arch is also increased thereby.

But indeed the immersion of the pier, if it be very tall, that is, if the depth of water be great in proportion to the span, will demand attention, although the arch should not be very flat. In such a case, the stability arising from the pier is often as great as that which is derived from the weight of the arch. It can seldom be

greater, and consequently can seldom require an addition of more than one fifth of that breadth, which would be sufficient were there no immersion.

We might easily give a theorem for this in rectangular piers; but it is hardly worth while; the effect of any addition is easily determined in the first formula, which we think, on the whole, although only tentative, the most convenient rule for the practitioner.

But although the total immersion, even of a lofty pier, will seldom require any great alteration in the thickness, there is yet another circumstance which well deserves attention. Bridges are often built, especially in a tide-way, with the arches springing below the high waters; we have in that case a diminution from the weight of the arch itself, but unless the keystone be under water, the horizontal thrust is unchanged; we must, accordingly, in our calculation, make the same diminution for that part of the arch which is thus immersed, as we did in the above example for the piers. The result will oblige us still more to increase the thickness of pier.

On the whole, we may conclude from this investigation respecting the piers, that the increase of breadth which may be, and usually is given to the pier, is of much less importance, on account of the weight that is thereby gained, than by its increasing the length of that arm of the lever, whereby the weight of the whole resists the effect of the horizontal thrust oversetting it.

Instead, therefore, of building up the pier with perpendicular sides, we should think it more advisable to begin the foundation of the pier on a base much wider than usual, and from thence, by regular recesses, or otherwise, gradually to diminish it, until, at the springing of the arch, it does not exceed the depth of the two archstones, while the outline of the pier may be a curve of any shape that is most pleasing. Many advantages would, in our opinion, be obtained by this construction: the water way will be enlarged; the pier equally strong; the stability equally great, nay, much greater than usual; and the chance of the foundations being hurt in floods will be greatly diminished: and all this with a smaller quantity of materials.

Before we take leave of the stability of piers, it will be proper to request the reader's attention a little longer to a case which we have hitherto but slightly noticed, we mean when the waters come to encroach on the crown of the arch. In this event, the stability arising from the arch is diminished by the loss of weight in all that part which is immersed. The horizontal force acts as before; it will be propagated through the immersed archstones. The weight of the pier is diminished by the immersion. All this must be compensated by an increase of breadth in the pier.

Suppose the waters to rise to the key-stone, the horizontal thrust is still unaltered, and is propagated as before; the intermediate archstones, however, lose two-fifths of their weight, and, supposing them jointed to equilibration, they will all have a tendency to rise and slide up. This is particularly the case with the lower stones of an arch with radial joints, for we know that these have such a tendency independent of this. What therefore is there to prevent them? Their mutual friction, and the back or lateral pressure only. Their friction, however, is now much diminished, and so is the weight of the backing, on account of the immersion.

In drawing the limit of position for the joints to be equilibrated by friction, therefore, in Plate LXXXI. Fig.

5. we ought to diminish the lengths on the line, the key section only excepted, and observe the effect on the position of the joints; the general effect will be, to make these joints approach nearer to the vertical, or, in other words, to draw them to lower centres; and, if we are so inclined to admit of the arches being flatter segments, this observation is of use, and should be attended to in the formation of culverts, &c. which are often glutted.

Suppose, now, the waters to rise even higher than the keystone, the weight of the keystone itself being diminished, the arch will be in the very same predicament as if it were formed entirely of materials of a smaller specific gravity than before, and its chief danger will arise from the transverse action of the stream tending to overset it.

This will be the case when the water, having free ingress through the materials, or through the gutters of the bridge, rises as fast in the interior of the building as without. But this is not always to be expected. The side walls, or parapet, may be so formed, as not to admit the water to enter, at least not with sufficient rapidity. The arch itself, we are sure, will not, for it is all laid in mortar. Now, in the event of the arch being formed with open work in the haunches, it will not, we think, be going too far to say, that there may be a point to which, if the waters arrive, the whole weight of the arch may be balanced by the hydrostatic pressure upon the intrados; and in that case, it would be shoved off in one mass by the pressure of the stream.

This is by no means even an improbable supposition, for the key-stone itself will begin to move whenever the waters rise one and a half times its thickness above the solid matter at the crown; and it will readily be granted, that every other section is pressing strongly upwards by that time. It may, indeed, be alleged, that the pressure of dead weight over them would keep them down long after that, and this we do not deny; but the derangement which it is likely will have taken place among the lower stones, by such a pressure acting from the points of the wedges, will, in all probability, be such as to render the destruction of the arch inevitable.

For example, take a stone of a foot square, and 4 feet deep in the soffit, near the springing of an arch of 40 feet rise; suppose the arch full, this stone is pressed back with the weight of 40 cubic feet of water; that is, a force of four times its own weight, and as a similar force, though gradually lessening, acts upon every other stone to the crown of the arch; it is we think, very obvious, that their united effect is likely to be of much more consequence than the thrust of the archstones.

But we may find another opportunity for rendering these motions somewhat more precise, by subjecting the forces to calculation, when we come to treat of *CULVERTS*, under *INLAND Navigation*, the chief case where such a process is likely to occur; and which, from that circumstance, require some peculiar maxims of construction.

OF THE FALL UNDER BRIDGES.

The piers of a bridge form an obstacle in the way of the waters, and will cause them to rise above the general level. The same body of water which flows in the open channel must be conveyed through the openings of the bridge. The narrower that passage is, the swifter must be the current. And this additional swiftness is only to be produced by a descent from a greater height. Con-

sequently, the water will accumulate above the obstruction, until it runs off as fast as it comes, or until the velocity in the contracted water-way be to that in the open channel, reciprocally as the relative sections of the stream.

Granting that the velocities of the running water are such as would be produced by falling from a certain height above the stream, a principle which is at any rate sufficiently just for our purpose, it follows that the fall, or accumulation produced by the obstacle, will be measured by the difference between the heights which would be requisite for producing the two velocities, viz. of the river in general, and of the current just under the bridge. But if a body fall a feet in a second of time, it acquires a velocity of $2a$ feet per second, and the heights are as the squares of the velocities; wherefore, in order to produce the velocity v , we must suppose a fall from a height $\frac{v^2}{4a}$ or $\frac{v^2}{164}$ expressing v in feet, and neglecting that small fraction, whereby the fall of a heavy body in one second exceeds 16 feet.

But when water is forced from a larger channel through a smaller passage, it is observed, that the stream through this passage is contracted. This contraction has been variously stated. It is probable, that the ratio of the diameter of the contracted stream to that of the passage, is that of 4 to 5, or .8 to 1, according to Bossut, Michelotti, and Venturi.

Buat gives .6 to .9, or .66 to 1.

And Newton 21 to 25, or .84 to 1.

Consequently, if c express the breadth of the water-way between the piers, $\frac{4}{5}c$ is the water-way contracted; take b the breadth of the channel, $\frac{4}{5}c : b :: v : \frac{5b}{4c}v$ the velocity in the contraction; and to produce

this velocity, we need a height or fall of $\frac{56v^2}{4c^2} + 64$, and the difference between that and the former, or that which produces the original velocity v , will be $\frac{56v^2}{4.8c^2} - \frac{v^2}{8}$ the fall sought; or $\left(\frac{5b^2}{4c^2} - 1\right)\frac{v^2}{8}$ will also be a theorem for it, which may be thus expressed.

Add one fourth to the breadth of the river, and divide the sum by the water-way under the arches; from the square of the quotient subtract unity; and multiply the remainder by the square of one eighth part of the mean velocity of the stream for the fall in feet.

Upon this principle, the following Table is constructed. It is not so complete as could be wished, for a great deal depends on the depth of the river; the effect of which is not so easily ascertained, and the due consideration of it would extend our investigations much further than the present subject would warrant. We may find another opportunity to communicate some further researches on this matter; and, in the mean time, what we give here will, we think, be of no small value to the engineer and practical bridge-builder. We have given a separate column for the usual designation of the stream, and for the nature of the bottom, which will just bear the velocities expressed in the first column, that the use of the Table may be extended and facilitated. For, by this means, a look at the bottom will determine the state and velocity of the river, without the necessity of measuring it. We next give the head or fall produced by various obstructions, and the velocity thereby acquired, from whence we are enabled to form an idea of the action likely to take place upon the bottom.

We have already admitted, that this Table is incomplete, yet it will, in all probability, answer many useful purposes. The science of hydraulics is as yet so empirical, that we can seldom predict with certainty what will be the result of a proposed combination. It is probable that the fall or head, and consequently the velocity acquired, is always stated too high, at least in the earlier part of the Table. For the contraction of one fifth of the breadth, is nearly as much as is observed in a narrow pipe. We have, indeed, made no allowance for the contraction or diminution of effect which may be supposed to arise from the friction and other causes in the original bed of the river. Or, what is the same thing, the additional head which is requisite to overcome this friction, over and above that which is due to the assumed velocity of the stream. And again, the friction increasing under the piers, from the increased velocity of the stream, will require also an additional head of water to overcome it. This, in small velocities, and with small obstructions, is a very great part of the whole rise. Its proportion diminishes in the latter part of our Table. So that, in all useful cases, it is likely to be nearly counterbalanced by the great rate of contraction we assume.

In order that the Table should be complete, we must divide it into two parts, one referring to the velocity, and the other to the difference of level of the river's surface, for a space equal to the breadth of the bridge. The depth, too, is a material consideration in discovering the acquired velocity. But we do not see the importance of these *minutiae*, for the requisite data are not to be obtained with similar exactness.

As an example of the purposes to which this Table may be applied, let us suppose that a bridge is to be built over a river of 100 feet wide, the usual velocity of which is 3 feet per second, and, of course, the bed is in all likelihood composed chiefly of round pebbles. Let these pebbles and gravel be supposed to extend to the depth of 3 feet, and under that a stratum of fine firm clay. Let it be proposed to give the bridge a water-way of 75 feet, that is to say, two abutments projecting $4\frac{1}{2}$ feet each, and two piers of 8 feet thick each, a centre arch of 35 feet, and two side arches of 20 feet span each. It is only proposed to lay the foundations two feet below the bed, and to spring the centre arch two feet above the usual waters, giving it a rise of one-third of the span.

Let us enquire whether such a structure is likely to be durable.

From the table it appears, that the obstruction being one-fourth, and the velocity 3 feet, the head will be .2484, or about 3 inches, and is therefore not likely to encroach on the crown. But the velocity under the bridge will be 5 feet per second, and, of course, would require boulder stones or rock to withstand it; the gravel bed will therefore be cut up under the bridge, and to a depth which, although not easily predicted, is likely to be that which will make the area of the section of the current, allowing for contraction, as great as where the river is free. For this will restore the original velocity, and prevent farther damage, provided the pebbly stratum holds to that depth; for should the strata below be harder or coarser the damage will be less, and if softer the contrary.

Suppose, again, the depth of the river, in its usual tenors, to be 3 feet at the left, and 4 feet at the right pier. Nothing is more common than such a difference of depth; and it is to be observed, that, whatever may be the cause of the inequality, the erection of the bridge does little or nothing to remove it. We may therefore suppose the inequality of depth as likely to continue, whatever other changes are produced.

	At left Pier.	At right Pier.
Original depth in feet	3.	4.
Increase for obstruction, $\frac{1}{4}$	1.	1.33
	4.	5.33
And $\frac{1}{4}$ for contraction on the } above principle	1.	1.33
	5.	6.66
New depth being as required } velocity	5.	6.66
Deduct original depth	3.	4.
Depth cut by the river in feet	2.	2.66

The depth cut in the uniform stratum will not, indeed, be quite so great as this; for the matter excavated will be thrown up as a bar across the river below the bridge, and will add to the depth by heightening the surface of the water.

The left pier, then, which is only founded two feet

under the bed, may stand well enough, but the right pier is in manifest danger, being undermined nearly eight inches. It must therefore be laid deeper. It will not be safe, however, in proceeding deeper with the foundation, to expose the smallest part of the clay; for that will move off with a less velocity of current than the gravel or pebbles, and the pier will be still further endangered. Our Table shews us, that it will not bear one-third of the velocity of this stream, and, consequently, runs the risk of being excavated to a great depth indeed. The only safety is in the gravel rolling into the hole thus formed, and ultimately stopping it, not, however, without leaving the pier in a dangerous situation.

Suppose further, that the river is liable to floods, and that, from observations of its higher marks, it is thought that the channel may be in that case 200 feet wide and 6 feet deep, and the progress of the freshes about $3\frac{1}{2}$ miles per hour. What will be the consequence of such an accident happening after the bridge is built over it?

If we take the depth of the river at 6 feet on an average, the water-way under the bridge is only $\frac{1}{3}$, and it is probable that the diminution of depth towards the shores will be made up by a greater depth in the channel, suppose 9 feet: This would encroach on the crown, and place the bridge in a still more dangerous predicament. Yet adhering to the supposition of an obstruction of $\frac{1}{3}$, we find, that for a velocity of five feet (3.4 miles,) the head is 3.950, or about 4 feet, and the acquired velocity $16\frac{2}{3}$ feet per second. This will produce an absolute cataract, and will sweep out stones, gravel and clay, to such a depth, if continued even for a short time, as will undoubtedly destroy the structure. A pavement, or even an inverted arch, will be an ineffectual preventative, in a case like this. But that we may see the result more distinctly,

Let us state the general depth = 6
Add for obstruction $\frac{1}{3}$ or 3.75

For contraction $\frac{1}{4}$ or 2.44

12.19

This gives the depth under the bridge when the general velocity is restored, viz. 5 feet.

Add $\frac{1}{3}$ to bring it to tenor velocity 8.09

It will cut in the pebbles till the depth is 20.28
But there is only 9

So that it cuts below the bed 11.28

But as there is only 3 feet of pebbles, it passes to the clay; and as this will not bear more than $\frac{1}{3}$ of the common velocity, the river will cut in it until the depth be 60.84, which is far below any security that can be given to the structure, without a total change of the foundation.

We assumed, for the breadth of the actual water-way in the above Table, a rate of contraction, which is much the same as that observed in the diameter of a jet from an orifice in a thin plate. This may be going too far, but we think it advisable to keep the builder on the safe side of the limits of practicability. Square ended piers, and abrupt projections, are likely to produce as great a degree of contraction, especially when the river runs in floods, the only case that is particularly deserving of attention.

But the discharge through the arches will be materially improved, by forming the piers with pointed sterlings, and otherwise adapting them to the figure of the stream. In rivers, where the arches are wide in comparison of the depth of water, the contraction does not appear to amount to a fourth of the above, or one twentieth of the whole water-way. And in this we are confirmed by the experiments of Eytelwein and Bossut. The former of whom states the contraction, in such a case as this, to be from 8.02 to 7.7, or nearly $\frac{1}{5}$.

We have, therefore, calculated the following Table upon the principle of a contraction of $\frac{1}{5}$; and conceive, that when circumstances are most favourable, allowing for the additional friction caused by the obstruction, &c. it will be found to come exceedingly near the truth.

The Rise of Water produced by Obstructions to the Current, when forced to diminish Contraction, as Piers with pointed Sterlings, &c.

By the help of this Table, we may see the effects likely to be produced in rivers by the usual accidents to which they are liable. The velocities above ten feet produce inundations that sweep away every kind of structure. Those in the latter part of the Table are given as fair results of the theory, but, in fact, they are impracticable.

In Westminster Bridge, the piers form about one-sixth of the water-way; the velocity is between 2 and 3 feet, or more accurately $2\frac{1}{2}$ feet; the head, therefore, will be between .036 and .082, more accurately .045, or about half an inch; which is exactly the greatest fall observed by Labelye.

At London Bridge, the apparent water-way is only one-fourth of the breadth of the river, but is much reduced by the drip shot piles, which have been driven into the bed to protect the foundations. The velocity of the stream above the bridge is 3 feet 2 inches, which, by this Table, would give a head of 2.6 feet, and by the former one 4 feet. We cannot suppose these piles to take off less than one fifth of the water-way, which would make the head 4.31 by this Table. But probably the contraction is greater than this Table supposes, coming nearer that assumed in the former, (which would have given us a head of almost 6 feet,) since a fall of 4 feet 9 inches was observed about the year 1730; and the excavation had become so very dangerous, as to suggest the measure of cutting out one of the piers of the bridge, and throwing two arches into one.

The fall at Blackfriars will be somewhat less than at Westminster, but will not exceed one inch. In the same example, as before tried, this Table affords the following results:

1st, The Bridge in common Waters.

Original depth	3	4
Obstruction $\frac{1}{5}$	1	1.33
Contraction $\frac{1}{10}$	4	5.3
Original depth	4.2	5.6
Depth cut by the river	3	4
So that the piers are safe in common waters.	1.2	1.6

2d, The Bridge in Floods.

General depth	6
Add for obstruction $\frac{1}{5}$, or	3.75
Contraction $\frac{1}{10}$	9.75
Depth when general velocity restored,	4.87
viz. 5 feet per second	9.137
Add $\frac{1}{3}$ to bring it to tenor velocity	6.092
The pebbly stratum will be cut until the depth is	15.23
But there is only	9.
There will be cut below the bed	6.23

Now, since the pebbles extend only to three feet, the waters pass to the clay, which bears only one-third of this velocity, and would therefore require a depth of 45.69, or 36.69 below the bed: The bridge therefore cannot stand in such floods as this. Suppose, then, that it be proposed to make a total change of foundation, as, by paving all across the river, or any similar operation, referring to the Table with an obstruction of $\frac{1}{5}$, and velocity 5 feet, we find the head produced is 2.6725, and velocity 14 feet per second, which would require a bottom as firm as solid rock. With good workmanship, however, the pavement would stand a considerable time, especially if the joints were so carefully closed that water could not readily penetrate, and work out the finer materials in which the pavement was bedded: For, although the water passes through the arch with this great rapidity, yet the general river being in a different train, and running with a much smaller velocity, will not bring along with it much heavier materials than the gravel and pebbles of the bed, and these will not be very injurious to the artificial bed at the bridge: For we are of opinion, that it is by no means the action of the water, but rather the attrition, or battering and rubbing of the boulderstones, gravel, and sand, brought down by it, that renders the hardest rock liable to be cut up by the force of a swift running stream. It is nevertheless, extremely difficult so to secure a pavement, or inverted arch, in a river, that the water will

not ultimately carry it away, even when the river does not run foul in its freshes. The great velocity which has been communicated to the river, cannot be supposed instantaneously to change upon passing the obstruction. Instead of that, we see a swift current shooting along in the line of the arches for a great way below the bridge, while powerful eddies run up in the line of the piers, casting up at length banks or shoals behind them, which tend, in their turn, to strengthen and prolong the original current and eddy. Whatever pains, therefore, we take to secure the pavement or inverted arch, this strong current must cut up and carry away the materials of the bed behind them; an operation which, if once begun, must constantly go on with increasing force. The water will have a fall over the lower end of the pavement, and will gradually wash out the foundation of the outer course of stones, which being immersed in water, will not be difficult to move. A few stones dropping out will add to the power of the stream, by roughening the bottom. Course will loosen after course, until the whole presents only a loose mass, ready to be torn up and swept away by the first ensuing flood in the river.

We could wish that what we have said here may induce persons properly qualified to turn their attention to the subject. We are convinced it is one of the most important departments of the art of bridge-building. Mathematicians have bestowed much time and pains on the equilibration of arches,—a matter about which the common bridge-builder seldom seems very solicitous. We have seen that, in reality, the usual speculations of that kind have hitherto led to no one useful practical result. Nay, if the deductions of the theory were to be followed too implicitly, they may lead, as in the case of the catenaria, and even the flat arch, to the proposing of weakness instead of strength, and craziness instead of stability.

But the security of the foundation is that about which the practical man is, with reason, most solicitous. He knows that it demands his greatest care. An error in that is irremediable, and there it is that his work generally fails. Give the ancient mechanician only a place to stand on, and he would have moved the world; give the modern engineer only a sure foundation, he will raise a structure as durable as the materials of which it is composed.

OF THE STERLINGS OR EXTREMITIES OF THE PIERS.

The reader must before this have seen, that there would be a great impropriety in forming the ends of our piers into planes at right angles to the stream; the water which is thereby shot off abruptly to each side, obstructs the general current by contracting the section, makes an increase of velocity necessary, which at the same time increases the action on the bottom, and hastens the downfall of the structure.

The bridge-builder, therefore, has in all ages endeavoured to obviate or diminish this contraction, by building projecting sterlings, or breakwaters, towards the stream, with the intention, as it were, of splitting the current, and conveying the waters more quietly under the arches. Those which point down the stream, in rivers without reflux, were at first perhaps built only for the sake of uniformity; for although probably little less important than the other, they do not, as they are generally formed, seem calculated to serve any good purpose.

The form of the sterling has given rise to some discussion, and bridge builders do not yet seem agreed on what is the best. For the most part, they have been formed into an isosceles right angled triangle in the horizontal plan, having the right angle facing the stream; from a notion, perhaps pretty general among workmen, that this is of all angles the strongest. The projecting edge rises perpendicularly till above the surface of the water, and the spring of the arch; what is higher being merely matter of ornament, need not be mentioned here. At other times, the plans of these cutwaters or sterlings have been formed into two arches, of 60° each, described from the two angles of the pier, into a semicircle, or semiellipse, on the conjugate; or into other and probably fanciful figures, as in Plate LXXXI. Fig. 7. Nor are these different methods without their advocates. Thus it is said for the right angle, that it divides the stream best, and a more acute angle would be too weak; that the semicircle and semiellipse, are best calculated to resist the shock of a loaded barge, or the like; and the Gothic intersecting arches, combine in some degree the advantages of both. But it is evident, we think, that if there be any form, which really deserves a preference over all others, it must be that which is adapted to the figure of the contracted stream; and which delivers the water in such a manner, as totally to fill the breadth of the archway. Unfortunately however, our notions of the motions of fluids are yet so far from being precise, that it is a matter of no small difficulty to discover what figure is best adapted to the purpose in view.

That we may have the clearer conception of this matter, let us attend a little to the way in which a fluid in motion may be supposed to act upon any obstacle.

The particle moving in the direction EF (Plate LXXXI. Fig. 8.) would strike the pier with the whole of its force, if the end of the pier was in the line AC, and the number of these particles will be as AD; but when the end is formed into the triangle ABC, the effect of each particle on the plane AB is diminished in the proportion of the sine of its incidence EFB; and the action on the face being given, the effect of it in the direction BD, or parallel to the axis, will be found by still further diminishing it, in the ratio of the sine of obliquity. In the common case then, when the length of the pier is in the line of the stream, the resistance of the pier will be as the square of the sine of incidence, or it will be inversely as the square of the length of the face AB of the pier, that being a straight line. Otherwise, if EF represent the absolute force of any particle, draw the perpendiculars, FG, EG, and GH, then FG exhibits the impulse perpendicular to the force AB, and FH the effect of that impulse in the direction of the axis BD; where, by the way, it may be observed, that if the angles DAB and DBA be equal, that is, if ABC be a right angle, then are FG and GE equal, also FH and HE; so that the absolute impulse on the sides of a rectangular wedge is just half the impulse on its base. We might pursue this mode of reasoning much further. We should find among other things, that the absolute impulse on right lined triangles, is less than on any curvilinear figure; that the impulse on cylinders, or the front of half cylinders, is just two thirds of the direct impulse on the base; that in all other curves, the nearer they approach to the right lined triangle, the less is the impulse upon them; and it is sufficiently evident, that the impulse will be always the less the more acute we make the vertex of that triangle, that is, the greater projection, and the sharper a point we give to the pier.

This is the way in which De la Hire, Emerson, and other writers, have treated the subject. They give equations expressing the properties of different forms of sterlings; the whole being derived from the common theories of the resistance of fluids, conceiving the impulsion of the particles of the fluid to be the same as in the collision of hard bodies in free space.

But it is needless to follow this theory much further. We are convinced that it is founded altogether upon an improper assumption; and, at any rate, it is of small importance to the point in question. We think it may even reasonably be doubted, whether the best form of the sterling be merely that which gives least resistance to the stream. Should we not rather enquire after that which guides with most effect the water under the arches, and prevents the dangerous action on the foundation? At all events, we cannot concede, that the mode of action of the particles of water is the same which the above theory supposes, and which is commonly employed by writers on this subject. It would lead us into too wide a digression, to state the reasons which may be given against this doctrine of impulsion; besides, we shall have another opportunity of considering the subject more at length. See *HYDRODYNAMICS*.

We shall, therefore, at present, only exhibit, in a familiar way, the notion we have of the real action of a fluid in motion, which, although it may be more difficult to adapt to the precision of mathematical reasoning, will, we are convinced, be of more value to the practical builder, in giving him clear conceptions of the actions against which he is to provide. Let $abBA$, Plate LXXXI, Fig. 9, and $cdDC$, Fig. 10, be a thin film of water, which has advanced against the flat end AB , CD of the pier, and whether the first lamina of particles act by impulsion or not,—for this is not a place for metaphysical discussion,—let another and another succeed, until at length they constitute a plate or film $abBA$, or $cdDC$, possessed of the properties of a fluid. This film will have had its direct motion destroyed by collision with the flat end of the pier. It cannot flow back, for it is stopped by the adjoining and following waters. Let us suppose it for a moment, to be stationary. The second film now comes on, and being hindered from passing up to the pier by the first film, $abBA$, can produce nothing like impulsion upon the pier, but it will propagate its force through the fluid film, in the way in which only a force is propagated through fluids; that is in every direction. The pier, therefore, will receive the impression of the second film unimpaired, but in the way of a pressure only, not as an impulsion.

In the mean time, the first film which is compressed between the pier, and the second film advancing, and the waters of which cannot as yet move off sideways, being opposed by the other parts of the stream, hitherto supposed to be at the same level, must obey the hydrostatic law, and yield to the impression received, by its waters rising upwards, the only way in which they are free to move. There will be an accumulation Cef immediately before the pier. The second film will also be raised upon the same principle, but not so much; and the third will be somewhat less than the second, and so on.

Now, it is evident, that the superficial waters of this accumulation being so much higher than the rest of the stream, must tend to slide off on all sides. This sliding off will cast them down in inclination towards the edges, and of course the greatest elevation will be just in the

VOL. IV. PART II.

middle between A and B . At the same time, the same pressure which produces this accumulation, or, if it may be so considered, the very accumulation itself will propagate, in every direction, through that film, a corresponding pressure. This will enable the waters of the film to escape at each side, by pressing transversely on the passing current. No water could so escape without such an accumulation as we speak of; for the passing stream, being otherwise at the same level, would react with an equal pressure.

The notion, therefore, of the particles of water being reflected as in the collision of bodies in free space, cannot be entertained. Speculations founded upon that principle leave out the most remarkable feature of the case, viz. the fluidity of the water. Yet a trifling attention to that circumstance, renders the notions throughout the whole process much more familiar. We have established the fact of the accumulation of the fluid immediately in front of the pier. It is evident that no force whatever can be propagated through the fluid, without such an accumulation; we may therefore consider at once the accumulation as the cause, mark, and measure of every subsequent modification of the passing stream, and we will find it fully equal to the explanation of all the phenomena.

Of the film of water in the immediate neighbourhood of the pier, every part is urged laterally with the same force, viz. the excess of pressure produced by the accumulation. And, upon the supposition that all the water of the passing stream proceeds with the same velocity, which, by the way, is not strictly true, we might conclude that the deflection produced at the shoulder of the pier is the same at any depth. Now this deflection will have some proportion to the velocity of the stream. It evidently depends on the rapidity of the current. In the language of mathematicians, it will be a function of that velocity. Suppose, for a moment, that the velocity of the lateral discharge at the shoulder of the pier be equal to that of the current, it is plain that these waters, with those which are immediately contiguous in the stream, moving parallel to the side of the pier, would be projected in the diagonal of a square which had the side of the pier as its side. In that case we must suppose a certain space immediately behind the shoulder of the pier to be void of water; and at the same time, this sort of repulsion will produce a head of water, or accumulation in the stream, immediately beyond that void space. This accumulation will be propagated from the shoulder of the pier, as a centre across the arch, at the same time it will be carried down the stream; and accordingly, we do always see a wave, which proceeds from each sterling or abutment of an arch, and which meet perhaps a considerable way below the bridge: but, at the same time, and what is of more importance, the waters, which are, as it were, projected from the shoulder of the pier, are not at liberty to proceed in that direction; having on one side the void space above mentioned, they are repelled on the other, by the lateral and hydrostatic pressure of the general mass. This will, of course, act perpendicularly to their direction, and produce ultimately a sort of gyration or revolution. The superficial waters will likewise tend to run over and descend into the void; as they descend, they are exposed with the lower waters, to the lateral pressure of a greater depth; the gyration will become more rapid in descending; and its radius of curvature shorter. The void will assume the appear-

3 S

ance of a hollow cone, the apex pointing downwards. The descending water will at length strike the bottom, and be reflected upwards; the motion of the apex will still be the most rapid, and will thereby produce that boiling appearance which we generally see towards the tail of the pier, and for a good way below the bridge. The general current is no sort of obstruction to this reflection from the bottom; it is perpendicular to its direction, and therefore neither helps nor hinders it, but it is the cause why the vortex is at first elongated in the direction of the stream, and why, after reflection from the bottom, it reappears considerably below the place of its original formation.

We have as yet taken into consideration the effect only of that film which lies in the immediate neighbourhood of the pier, and assuming it to pass laterally with a velocity equal to that of the general current, we have supposed that the primary deflection will be at an angle of 45° , but the second, third, &c. films, which are in the front of that, will have a similar lateral discharge, and will therefore have deflected a part of the waters of the general current, before they have reached the pier and the last film; but the deflection cannot be so great, because the accumulation is not so great. In fact, the first deflection is in a manner nothing. It is a nascent quantity; but each succeeding film having some room made for it by the deflection produced by the former, will be broader than it, measuring across the current, and will in its turn add a little to the former deflection; yet so, that the ultimate breadth can hardly be much greater than that of the pier, let the deflection be what it may.

All this while we are speaking of a square ended pier; and it is now clear, that the water which lies in a manner stagnated before it, is bounded on the plan by two curve lines, which have their convexity turned towards the axis of the pier, and are of course concave on the outside. If this, therefore, be the most advisable form of the sterlings of piers, it is, in all probability, different from any that have ever yet been constructed. Before, however, going further, we may observe, that the water in the front of the pier is by no means stagnant; passing in the direction of the stream, every film has a greater velocity than the succeeding; it has to supply not only its own waste by the lateral discharge, but that of all the succeeding, or rather, perhaps, its own waste, in passing through all the succeeding stages. At the commencement of the accumulation and deflection, the direction, as well as the velocity, is, in fact, that of the stream at the pier; the velocity in the direction of the stream vanishes, for the whole is deflected.

We conceive, therefore, although with great diffidence, that it is with impropriety, Newton has said, that the motions are the same as if a certain part of the water in front of the pier or obstruction were frozen, and he conceives this part to end in a point. No part of the water which is before the pier is perfectly stagnant, and it can therefore by no means be considered as frozen, neither can that portion of the water be supposed to come to a point; for, if we take, as the quantity of current intercepted by any pier, to the lateral discharge at the shoulder, so the breadth of the pier to a fourth proportional, it is plain that, roundly speaking, we have the distance on each side of the axis, to which this water extends, at that part of the stream where it may be supposed to be confounded with the general current;

and this breadth must be something, since the discharge is something.

Giving up then the idea of making a sterling, or point to our pier, which shall be the same as the water that is supposed to stagnate before it, we think the best thing that can be done is to offer some maxims of construction, which, though they do not constitute a complete rule for the perfect formation of sterlings, will yet serve to improve the practice of the bridge builder, and preserve him from falling into gross and dangerous errors.

It is evident that all abrupt angles at the junction of the sterling with the pier are to be avoided: this part should be neatly and regularly rounded away, so as to prevent the gyration above alluded to, by giving the figure of the incipient part of the curve to the shoulder of the pier. Neither do we approve of the parallelism of the sides of the pier. A small convexity might be given them with much advantage, and without adding to the trouble of erection.

It were perhaps to be wished, that in the horizontal section of the curved part of the sterling, it should have a contrary flexure, so as to make the point of it, by being as sharp as possible, turn aside the waters with the greater ease; but this is attended with a manifest disadvantage. The point will then be liable to damage, and the most trivial variation in the thread of the stream, would produce in an increased degree all those gyrations we wanted to avoid; such points too, in navigable rivers, would be fatal to loaded craft. But while we do not attempt to give this acuteness to the pier in the horizontal section, we may acquire it with great facility in the longitudinal or vertical section. For that purpose, the lower courses should be made gradually to project before the upper, and if the formation of the pier admits of it, they may also be made to project on the sides; but care should be taken in so doing to attend to the rules we have formerly given for its stability, and not uselessly to increase the mass of the pier. As we descend, however, the courses of the sterling should become more acute, and project further up the stream, and thus the pier may be supposed ultimately to end in a mere point. In short, the figure of a pier, or sterling of this kind, will have a considerable resemblance to the sock of a plough,—an instrument which, in its application, has a considerable analogy with the sterling. It may be asked, whether these projecting courses should be left by the mason in steps, or trimmed away to a regular curve surface? We conceive, that there are good reasons for choosing to leave them in steps. For, independent of the saving of labour, when the current has any obliquity to the direction of the pier, it will flow over the acute point of the sterling, and being reflected by these steps, will be in a great measure prevented from injuring the bottom. The safety, however, of craft would seem to make it proper to round away the fore corners of the courses.

As to the point of the pier down the stream, its figure must, for the sake of uniformity, be assimilated to the other. It were well if we could in this case apply the contrary flexure above mentioned. The same difficulties are not to be dreaded; and although it may not be easy or agreeable to form it in the horizontal section, yet, by prolonging the tail down the stream further than usual, we will virtually obtain the same thing. The tail of the pier is of less consequence to the stability of a bridge, though it may certainly be contrived so

as to facilitate the transmission of the water. Bridges seldom fail on that side; and as they are usually constructed, there is an eddy below the pier, which, although it obstructs the current, and injures the bottom, yet casts up a shoal below each pier that serves to protect the foundations of the building.

Bridges built in the way we have now mentioned, will appear greatly stronger than those of the usual construction; and they will really be so. Independent of their power of preventing the action on the foundation at the shoulder of the pier, which we have shewn in an early part of this section to be the principal cause of the decay of bridges, these sterlings will appear stout, curved buttresses, or as it were knees, to support the lofty side-walls; and by expanding the lower courses of the arch, advantage may be taken of the increased base, to cast the vault into a kind of groin, and thus give a greater degree of transverse strength to the whole structure.

This idea of extending the lower courses of the pier, and breaking, as it were, by degrees, the force of the current, is not new, and we do not give it as such. It may be seen with various degrees of perfection in many ancient and modern structures, particularly in the celebrated Pont St Esprit over the Rhone, which probably owes in a great measure its endurance to that expedient. But we wish merely to bring back to the builder a principle, which, in modern times, seems too often to have been lost sight of, and which was, no doubt, originally the result of a successful experience.

When necessity obliges us to form a bridge at a considerable obliquity to the current of a river, a danger is thereby incurred of producing a gyration on the *lee-bow* of the piers, which will be attended with all the evil consequences we have already explained. The obstruction to the current may be presumed to vary with the cosine of the angle of obliquity, and consequently the additional head must be as the versed sine of that angle. But if the sides of the river be parallel straight lines, the water-way under the bridge will just increase as the secant of the angle of obliquity, or inversely as the cosine. This will just counterbalance the obstruction caused by deflecting the current, leaving only the reaction of the bank, and the *weather-side* of each pier against the stream, to produce the deflection. There will be an accumulation on the one side of each arch therefore, and a depression on the other; while a strong gyration will take place on one of the shoulders of each pier, and which is likely to be attended with much danger. The water-way of the arch too is likely to be much contracted by this cause. All these appearances frequently occur, although the bridge appears to pass directly across the stream; because in such a case the bridge has been designed for the low waters, whereas the stream, when in flood, may have a very different direction. The course of the river therefore, above the bridge, should be carefully attended to, especially when the waters are high, and either corrected, or the position of the bridge adapted to it.

The effect of the gyration at the shoulder of the piers is curious; and, as it is one of the chief causes of their destruction, it is well deserving of attention. The beds of all rivers are porous, and will therefore be glutted with water; which again is every where pressed by the whole depth in the river: but at the shoulder of the pier there is a void, so that the bottom at that spot will not have the same vertical pressure that there is every where round it. Water will therefore rise out of the

bottom at that place, like a spring or fountain, and so much the more forcibly as the void is deeper. Or, if prevented from issuing, it will exert a strong pressure upwards, upon whatever forms the bottom of the void. Now, this void being sometimes even four or five feet deep, we need not be in the least surprised, that not only gravel and shiver, but even large stones, are lifted in it, and shoved away by the vertical motion.

For these, and other reasons, it is difficult to ascertain the exact amount of the obstruction caused by obliquity. Like every other department of our inquiry connected with hydraulic principles, experiments are yet wanting to assist us in making this a subject of calculation.

Instead, therefore, of occupying the reader's time with a mathematical discussion, from which, at present, little benefit can be derived, we conceived it better to offer a few practical remarks on the methods by which the chief difficulties of such a case may be obviated.

With this view we will venture to recommend, that whatever the position of the bridge may be with respect to the stream, the lengthway of the piers and abutments should coincide with the direction of the current as nearly as may be. A considerable deviation is perfectly practicable. We have formerly shewn, that the position of the joints of the arch may be varied, perhaps 30° from that of equilibration, before any slide is thereby produced among the archstones: we surely have the same liberty here, and this even when the coursing joints are horizontal.

This advantage of friction may be even improved by dowelling or other means, if thought beneficial. But if the coursing-joints, instead of being made horizontal, be formed at right-angles to the side of the bridge, we have the very same advantages that would be obtained were the bridge perfectly direct.

Did the subject admit of it, we would here give the theory of those arches which are not straight on the ground-plan, as the arched top of a bow-window, and the like, some of which afford pretty examples of the application of the principles of equilibration, and all of which, by means of the gravity, friction, or cohesion of their parts, admit to a certain extent of being steadily and solidly constructed. But we shall, at another opportunity, take up this subject, and, in the meantime, we hasten to other matters more intimately connected with our present inquiries.

The centres or framings of carpentry, on which the arches are built, are, in many cases, objects of great anxiety to the builder: they form one of the most beautiful applications of the science of CARPENTRY. But as the principles upon which the more difficult kinds are designed will not be clearly understood, without entering into more detail than is consistent with our present subject, we shall only offer in this article some of the most approved designs, and refer the reader for their explanation and discussion of their comparative merits until we come to treat of CARPENTRY.

To the same place we shall also refer the subject of wooden and iron bridges, which intimately depend on the same science; their statical equilibrium admitting of the introduction of a principle essentially different from those employed in erections of stone.

The side-walls and wing-walls of bridges constitute a part not the least important of our subject. They have, especially the latter, to resist the pressure of a mass of

earth behind them, forming the roadway up to the haunches of the bridge. Little has been written upon this subject in our language, and that little has been of no practical benefit. Muller and some others give us a few theorems respecting the thickness of the revetements in fortifications. Some of our elementary writers inquire a little into the same subject, as one case of the application of the doctrine of the centre of gravity. Their results, in almost every case, give a much greater thickness for walls of this kind, than is ever found necessary in practice. There can be no doubt that some principle must be overlooked in these investigations, which has a

material effect in their application. We cannot say that the inquiries of Belidor, reckoned one of the first of scientific engineers, have been more successful. In another part of this work we shall offer a theory of retaining walls, in general founded upon principles that are perhaps new, and that has been confirmed by the results of experiment. This theory has been found to agree with the ideas of practical men. It is capable of application to all cases of the kind, and it comprehends them all. But in this place it would be embracing too large a field to bring it forward. (A. N.)

PART II. PRACTICE OF BRIDGE BUILDING.

WITH regard to the practice of bridge building, the chief objects may be arranged as follows :

SECT. I.

1. The situation.
2. The design.
3. The materials.

SECT. II.

1. The foundations.
2. The Piers and abutments.
3. The Centres.
4. The Arches.
5. The Spandrels and wings.
6. The Parapets.
7. The Roadway.

SECT. I.

On the Situation, Design, and Materials.

1. The situation is generally determined by local circumstances, in a town by streets, and in the country by the roads adjacent. If the bridge is of a great size, or the foundations difficult, it is frequently advisable to choose the most favourable situation for the bridge, even at the expence of changing the approaches. It is absolutely necessary that the access be commodious, but where practicable, from the approaches being in a curve, the general outlines of a bridge are seen to most advantage. The situation should be chosen where the river runs in a straight course for a considerable way above it, and where the channel rather contracts at some little distance below. The direction of the bridge should form a right angle with that of the river above it. Rock should, if possible, be obtained for the foundations of the abutments and piers; next to rock, hard clay, or clay mixed with gravel, or otherwise firm gravel; but loose gravel, mud, or quicksands, are to be avoided as much as possible.

2. When the situation has been determined, a map or plan should be made of the channel of the river and adjacent banks, also of the streets or roads which are

to be connected with each end of the bridge. There should likewise be a section, shewing the breadth of the bed of the river, and the form of the banks on each side. Upon this section should be marked the lines of high and low water, to be determined by the marks of the greatest floods, and the best information which can be procured from the oldest inhabitants, and most observing people in the neighbourhood. The consistence of the bed should also be ascertained, by boring with properly constructed augers, especially in the scite of the abutments, piers, and wing-walls. There should likewise be a longitudinal section, shewing the declivity of the bed of the river, for at least 200 yards above and below the proposed situation.

When these steps have been taken, and the nature of the materials ascertained, the engineer has obtained sufficient data to enable him to make a suitable design. We shall at present confine ourselves to bridges constructed with stone.

The leading objects in forming a design are,
1st, The passage for the water under the bridge.
2d, The making a perfect roadway over it: And,
3d, The decorations.

1. The number and dimensions of the arches must depend on the breadth of the river, the nature of the foundations, the height of the banks, and the quality of the materials to be used. If the foundations are good, the banks high, the stone hard, and to be procured of proper dimensions, large arches will be found advisable; if the reverse is the case, the size of the arches must be diminished, and their number increased; if more arches than one are required, their number should be odd, in order that there may be an arch in the middle of the river: the middle arch should be the largest, and those on each side should diminish, so that their springing remaining the same, their tops may form a declivity of about 1 in 24. When piers are placed in a river, the breadth between the abutments should be made greater than the natural breadth of the channel at that place, by about double the thickness of all the piers. Where the bed of the river is soft or loose, the increased width must be considerably more. In proportioning the thickness of the piers to the span of the arches, great latitude has been taken, as will appear from the following statement:

	Breadth of piers.	Span of arches.		Engineers.
Roman.	5	23	in the bridge at Rimini.	Unknown.
	11	25 do. Vicenza.	
	38	110 do. Alcantara.	
Middle ages.	32	115 do. St Esprit.	Brothers of the Bridge.
	44	96 do. Lyons.	
	14	72 do. Port Royal.	
More modern times.	19	106 do. Orleans.	Mansard.
	14	128 do. Neuilly.	Hupeau.
	17	76 do. Westminster.	Perronet.
	20	100 do. Blackfriars.	Labelye.
	18	77 do. Perth.	Mylne.
At present.	14	90 do. Dunkeld.	Smeaton.
	12	72 do. Kelso.	Telford.
	8	65 do. Conon.	Rennie.
	8	60 do. Bewdley.	Telford.

From this statement it will be perceived, that the proportion has been varied from nearly one half to one ninth part of the span. As this important object has been discussed at length, when treating of the principles, it is only necessary here to observe, that the thickness of the piers, besides the span and shape of the arch, is affected by its rise, and in no inconsiderable degree by their own altitude, and the quality of the stone of which they are constructed; it is desirable, in order to lessen the obstruction to the water-way, to make the piers as thin as prudence will admit. The shape of the piers and arches should also be calculated, to form as perfect a water-way as possible; and on this account, all recesses and side projections, within reach of the water, should be avoided, and the connections of the abutments with the banks should be formed on the same principles.

2. If the bridge consists only of one small arch, and there is little intercourse, the road-way may be narrow and without footpaths; if the bridge is long, and there is much intercourse, the breadth must be increased, and have proper footpaths. Since wheel carriages have been in general use, few bridges, however small or remote from towns, have been made less than fifteen feet in breadth over the parapets; they are more generally made from 18 to 20 feet, in or near to considerable towns, from 26 to 30; and in or near large cities, they are made from 30 to 50 feet. The roadway should have a declivity from the middle of the length each way towards and beyond the abutments, of about 1 in 24; and the roadway, as well as the footpaths and parapets, should, near their extremities, diverge, to suit the approaches, whether one or more, at each end of the bridge.

3. The decorations should be varied, according to the situation and accompaniments. In the country, the utmost simplicity, consistent with distinguishing the essential parts, should be preserved; and even in the most splendid cities, or adjacent to palaces, all decorations should be kept perfectly subservient to, and in unison with, the essential parts: the neglect of this is a frequent error in designing bridges. Columns and entablatures, though proper in a Grecian temple, are ill suited to an edifice, where forms unknown to the Greeks are the leading features. As columns can only be placed over the piers and abutments, the entablature, intended to represent beams of timber, cannot be supposed to be wholly upheld by supports placed at such great distances

from each other. And the introduction of columns, in place of carrying up the piers, deprives the superstructure of powerful buttresses in situations where they would prove very beneficial. The affectation of preserving the entablature upon a perfect level, has led to making the roadway along the bridge also level, which is nothing less than constructing, at a vast expense, a piece of road more imperfect than what is formed by the common labourer in the open country; and besides, this mode of construction gives an appearance of feebleness to the outlines of the bridge. This false taste was introduced by some of the French engineers, and has of late been in some instances, copied in Britain. It cannot be too early reprobated, because bridges, when substantially constructed, remain for many ages, and are not easily altered.

In making out the design, the engineer should furnish a plan, shewing the form and dimensions of the foundations of the piers, abutments, wing-walls, and wharf walls connected with the bridge; an elevation shewing the general facade; also vertical, longitudinal, and cross sections, shewing the construction of the interior parts. In large bridges, there should be a plan or horizontal section taken at about one third way up the rise of the arches, in order to shew the mode of filling up the spandrels. There should likewise be a plan of the roadway, footpaths, and parapets; besides separate drawings of all those parts which cannot be made sufficiently distinct in the general drawings. A specification should likewise be added, describing in words, the quality and dimensions of every part of the work, and the form and manner of its construction.

3. MATERIALS.

The materials consist of timber and iron for piles, cofferdams, caissons, scaffolding, and centres; of stone, lime, and sand for the masonry; also gravel for embanking at the ends, and forming the roadway over the bridge.

Of timber, oak is the most generally useful, and where exposed to be alternately wet and dry, is most durable; and next to it are pitch, pine, and fir grown from the seed. Under low water, elm is very suitable; it does not easily split, and is very durable: indeed, in this latter situation any timber is sufficiently durable. For gangways, scaffolding, and centres, sound fir timber of natural growth is the fittest; it should be free of knots

and sap. In ties, bolts, and nails, malleable iron, made from wood charcoal, should be used. For receiving thrusts, forming supports, or dowelling stones, cast iron is the most proper.

With regard to stones for the piers, abutments, arch-stones, and parapets, no pains should be spared to procure the best which can be obtained at a reasonable expense. They should be of a quality not to be decomposed by the operations of the atmosphere, and they should not be intersected by cross seams. Where the quarry produces them with flat beds, much labour is saved; but when they are laminated, great care must be taken to have them laid on their natural beds. Their dimensions must, of course, be regulated by the magnitude of the work in which they are to be employed. If new quarries are to be opened, experienced workmen should carefully examine their quality; and specimens of the stone should be exposed for at least one winter and summer, in situations similar to that where they are to be used: experiments should also be made to prove their consistence. For the spandrels, wing walls, and backing, inferior stones may answer; but they should be such as can be laid with proper bond, and in regular courses. Those used on the external faces must be fit to withstand the effects of the weather: they should correspond with those of the piers and arches as to colour; and if regularly squared, should be brought from the same quarry, though they may be of smaller dimensions.

In procuring lime for mortar, it is of great importance that it will set or indurate under water; and where immediately exposed to agitated water, the outer edge of the joints should be laid with the British cement, discovered by Mr Parker, which in a few minutes becomes sufficiently hard. Where these cannot be procured, recourse must be had to substitutes: burnt and pounded iron stone, scales from an iron forge, hard burnt tiles ground and mixed with quick lime, all become hard under water, and in damp situations. In all cases, clean, sharp, or angular sand, is a necessary ingredient; and in rubble work it is better for being very coarse, or approximating to clean small gravel. In making mortar, we have known great advantage derived from using water which contained a solution of iron, and was of a dark reddish colour, approaching to black, which is frequently found adjacent to peat mosses. The lime should be used when fresh slacked, and be well beaten, or made with a machine called a mortar mill.

In using sand, Vitruvius very judiciously makes a distinction between sea or river, and pit sand; of the former he allows two, and three of the latter, to one of lime in powder. Dr Higgins, who made many experiments, and published a treatise upon calcareous cements, recommends (by weight) one of lime to eight of sand. Lorient, in describing what he conceives the secret of the ancients, mixes a portion of unslacked lime ground to a powder, with the mortar which has previously been made up in heaps in the common way. In

the specification for the Pont Royal des Thuilleries, by Mansard, and which seems to have served as a model in France, it is provided, that all the mortar of lime and cement, for the work under water, shall be composed of five parts, three of which shall be of good cement of tile, not bricks, and two of lime of Melun, well ground, or pounded together. For the common mortar, two of lime and three of sand. The Sieur Gabriel directs the same preparations for the bridge of Blois. Perronet, for the bridge of Neuilly, directs that the cement mortar shall be equal quantities of ground tiles from St Germain, or St Cloud, and lime; observing that this, on account of the quality of the lime, exceeds by $\frac{1}{10}$ the usual quantity employed in this sort of mortar. Of the other, or white mortar, he directs one third of slacked lime, and two thirds of sand. In the account of building the Eddystone light-house, Mr Smeaton gives a chapter upon water cements, from which we shall extract a few particulars; and earnestly recommend those who wish to be fully informed on this point, to peruse with attention the whole of that valuable chapter.

Mr Smeaton found, in many parts of England, limestone which produced lime, that when made into mortar grew hard under water. The best kind was at Aberthaw, in the Welsh side of the Bristol channel. He found the stone of Watchet, a small sea port in Somersetshire, had long been used in water works: it did not suit the purposes of agriculture. He traced the same sort of stone through the counties of Monmouth, Gloucester, Worcester, and Leicester, and thence by the vale of Belvoir into Nottingham, and Lincolnshire, at a place called Long Benington: he found it also in the counties of Dorset, Hants, Sussex, and Surry. It has also long been procured in Lancashire, under the name of Suttan lime.

After mentioning the shape, appearance, and qualities of the sundry stones, he concludes, that as this sort of limestone is found, blue, grey, yellow, and white, also in thin strata and lumpish masses, sometimes very hard and sometimes comparatively soft; that its fitness does not depend upon those appearances and qualities, neither does it upon the matrix in which it is formed. But he found, that when burnt, all the water limes fell into a buff-coloured tinge, and all contained a considerable portion of clay.

He found once a reddish coarse deep brown sand stone, of a somewhat tender nature, which when burnt, pounded and sifted, and mixed with slacked lime, and made into a ball, became very hard.

He states, that limestone in general loses about $\frac{4}{5}$ of its weight by burning; that slacked lime produces double the measure of the burnt stone or shells; that when made into a paste, it occupies but half the space of the powder; that two measures of slacked lime made into a paste, and mixed with one measure of terras or puzzolano, makes about $1\frac{4}{5}$ of mortar. The following table is the result of his observations, experiments, and practice.

No.	Water lime with puzzolano.	Lime powder.	Puzzolano.	Common sand	No. of cubic feet.
		Bushels.	Bushels.	Bushels.	
1	Eddystone mortar	2	2	—	3.32
2	Stone mortar	2	1	1	2.68
3	Do 2d sort	2	1	2	3.57
4	Face mortar	2	1	3	4.67
5	Do 2d sort	2	0 $\frac{1}{2}$	3	4.17
6	Backing mortar	2	0	—	—
	Water lime with minion.		Minion.		
7	Face mortar	2	2	1	3.22
8	Do Calder composition	2	1	2	3.57
9	Backing mortar	2	0 $\frac{1}{2}$	3	4.17
10	Do 2d sort	2	0 $\frac{1}{4}$	3	4.04
	Common lime with terras.		Terras.		
11	Terras mortar	2	1	—	1.67
12	increased	2	2	1	2.50
13	further	2	1	2	3.45
14	still further	2	1	3	4.35
15	Terras backing mortar	2	0 $\frac{1}{2}$	3	3.50
16	2d sort	2	0 $\frac{1}{4}$	3	3.37
	Common lime with minion.		Minion.		
17	Ordinary face mortar	2	2	2	2.75
18	2d sort	2	1	3	4.34
19	Ordinary backing mortar	2	0 $\frac{1}{2}$	3	4.05
20	2d sort	2	0 $\frac{1}{4}$	3	3.92

He observes upon this Table, that these materials are all supposed in the dry state: That the lime and puzzolano must be thrown into the measure or vessel with the same degree of force.

He denominates minion to be what falls from the outside of the lumps of iron stone.

He allows the day's work of a man for beating every bushel of terras; that is, two bushels of lime powder and one bushel of terras. The bushel is the Winchester level with the border. He allows iron forge scales, when sifted clean from dirt and clay, as equal to as much terras or puzzolano.

His mode of working is "to mix the due proportion of the lime and the puzzolano, the terras or the minion, together in dry powder; and it will also be well to have at least one third of the sand (either fine or coarse,) likewise dry; put as much water to the lime as, with a shovel or beater, you can bring it to a paste of a moderate consistence, but rather more wet than to be properly used as mortar in that state; then by degrees beat in the moist sand, and afterwards the dry, bringing it to a consistence by beating after every addition. The dry sand is intended to dry up the superfluous moisture so as to render the mortar fit for immediate use; and if this has not brought it to a sufficient stiffness, let it lie till it is inclined to set, and then beat it up to a due consistence; or if immediately wanted, beat in a little dry lime powder, always however faithfully remembering not to terminate beating till the mass has got all the toughness that you find it will acquire by beating."

In Scotland, most of the limes harden under water: that from Lord Elgin's great lime works on the river Forth, from Portsoy on the Murray coast, and from the island of Lismore, in the Linnhe loch on the west coast:

the last is the best, it slacks into a buff colour. Mr Telford discovered its qualities, when searching for materials for the western district of the Caledonian canal, by observing in a park wall, belonging to the Marquis of Tweeddale, built against spongy ground, and where water oozed through, that the mortar was hardest, and threw out stalactites; also that it was quite perfect on the top of the wall, where worked among small stones, without coping of any sort.

SECT. II.

On the Foundations, Piers, Abutments, Centres, Arches, Spandrels, Parapets, and Roadway.

The situation, general design, and materials having been determined, the next step is to prepare the foundations; and if the water is shallow and upon rock, or other matter sufficiently firm, the operations are very simple; nothing being necessary but to turn the water, by means of a mound of clay, from the space to be occupied by the abutments and piers successively, to clear and level the ground, and to proceed with the masonry: But when the water is deep, and the foundation soft mud or sand, or loose gravel, the difficulties frequently require all the art of the most experienced engineers. Even when the foundation is clay or rock, if the water is deep, and the currents from tides or land floods considerable, few operations require more talents or attention.

Various are the schemes which have been resorted to, in order to avoid or lessen the difficulties attending the laying the foundations of bridges. 1. A situation has been chosen in the bend of the river, to which, after the

bridge was constructed, a new river course has been cut. 2. A side channel has been formed, by which the whole, or greatest part of the water, has been drawn off during the time the foundations were put in the old river course; and the water so drawn off, was afterwards returned to its original channel. 3. Mill weirs on the river, below the proposed situation, have had their sluices drawn, or have been partly removed for a time. 4. And when there happened to be no weirs, the bed of the river has been deepened, for a considerable distance, in order to lower the water at the intended scite.

When the depth of the water has been reduced as much as possible, it remains to be determined in what manner to proceed. Anciently, (as in the case of London bridge,) in deep rivers, the foundations of the piers were made by merely driving piles all over the space, so that their heads stood level with low water; the spaces between them were filled with loose stones, and the masonry begun upon the top of them; but the piers were immense masses, and required to be protected by sterlings; which, leaving a very confined water-way, created a head and velocity which tore away the bed of the river immediately below the piers. This mode having been long disused, we shall proceed to consider,

1st, Batterdeaux, or Cofferdams; and,

2dly, Caissons.

Both methods have been employed with success: The greatest of the modern bridges in France, that is to say, Orleans and Neuilly, were constructed by means of the former; whereas, in England, the bridges at Westminster and Blackfriars were accomplished by the latter mode.

OF COFFERDAMS.

We shall first describe the measures pursued both in France and Britain, in working by means of batterdeaux or cofferdams.

The forms of these are varied according to local circumstances, and the ingenuity of the persons who have the direction of the work.

1. By driving two rows of vertical piles and plank piles, and filling the space between them with clay.
2. By driving main piles, and working with strong planking, laid in a horizontal position.

3. By driving one row of guaging piles, and filling the spaces between them with pile planks driven vertically.

The most eminent French bridge engineers, viz. Mansard, Sieur Gabriel, Gautier, Hupeau, and Perronet, in constructing their greatest bridges with cofferdams, directed piles, from nine to ten inches diameter, to be placed from three to four feet from centre to centre, and driven from three to six feet into the bed of the river, (if composed of mud, clay, or gravel,) and to rise (in the rivers) six feet above low water mark. Their pile planks were nine to twelve inches broad, and four inches thick; one frame contained 16 of these pile planks, which were driven at one time; these frames were placed along, and embraced three of the main or guide piles, and were composed of two uprights, of the same thickness as the pile planks, each sharpened at one end; these uprights were fastened together by two horizontal pieces, one below, and the other above, and separated by the thickness of the uprights; these frames being fixed, served to guide the pile planks; the grooves were two to three inches wide, and two inches deep; the shape of the groove was sometimes rectangular, and sometimes tri-

angular; and sometimes a groove was made in each plank, and a slip or tongue driven down. The distance between these two rows of piles, to receive the clay, &c. they made in still water to be equal to the depth of the water to be sustained; in running water, once and a half that height is recommended: The two rows were kept together by two tiers of ties, six inches square.

At Orleans, the two rows were driven ten feet apart from centre to centre; the piles were from 18 to 24 feet long, and nine to ten inches diameter without the bark; they were shod with iron, each shoe weighed 20lbs.: The pile planks were 18 to 21 feet long, nine to ten inches broad, and four inches thick; each shoe weighed 8lbs. The rams for driving the piles were about 1200lbs.; those for the pile planks 500 to 600lbs. At Neuilly, the piles were 22 to 24 feet long, nine to ten inches diameter, including the bark; they were driven six feet into the earth. The pile planks were 21 feet long, and four inches thick, driven six feet, by rams of from 600 to 900lbs.

When these two rows of piles and pile planks were driven and secured by ties six inches square, the space between them was cleared of stones and gravel down to the firm ground, by rakes and spoons, and then filled up with clay or earth, which excluded water. This being accomplished, hydraulic machines were established to lift the water from the inside of the cofferdam; these were pumps worked by men or horses. At Neuilly, water-wheels upon the Seine worked bucket-wheels, which threw up the water from 10 to 12 feet. After the water was pumped out, and the stones and gravel removed, Gautier, after having levelled the ground, laid down a grating, consisting of timbers, of 10 to 15 inches diameter, with openings of two feet, to two feet and a half square, and drove two piles in each opening. Hupeau and Perronet, after clearing the space within the cofferdam, drove piles at the distance of three to four feet from centre to centre; these piles are from 12 to 20 feet in length, and 12 inches mean diameter without the bark; their shoes weighed, including branches and nails, from 13 to 25lbs. They were driven with rams of 1000, 1181, 1384, and 1981lbs. until they did not sink two lines by the last sixteen strokes, after a continuation of thirty strokes; or until they did not sink two lines with twenty-five strokes, and received ten strokes afterwards. They began by driving the piles next the centre of the space, and finished with the outer rows. After the piles were driven, and, with the exception of the tenons, cut off nearly level with the ground, caps were morticed upon them, and upon these, along each row of piles, beams, 12 inches by 8, were fixed by pins or bolts; the spaces in this grating were cleared out for 18 inches in depth, and filled up with rubble masonry, laid in lime mortar, which grew hard under water; this was brought up level with the top of the grating; thin planking, four inches in thickness, was laid over the whole space, and pinned or spiked down to the grating; this platform extended seven feet beyond the face of the masonry of the shaft of the piers and face of the abutments. Upon this platform, the first course of the masonry was laid.

If the ground proved firm and water-tight, this process, although laborious, was regular and plain; but as the French engineers inclosed very large spaces around their masonry, great inconvenience frequently arose from imperfections in so extended a cofferdam, and sometimes from springs supplied from higher grounds rising within the inclosed space. From circumstances of this

nature, in one of the abutments at Orleans, frequent interruptions took place; they were forced to subdivide the enclosed space; and, at last, after having discovered the precise situation of the springs, to raise them by tubes, so as to discharge the water made by them above the level of the water of the river. It is, therefore, advisable, in order to avoid expence in the construction and after risk, to enclose the smallest space possible. Round the edge of the platform, they sometimes drove a row of pile planking, or laid a bed of dry rubble stones, about six feet wide, and about two to three feet deep. For Neuilly cofferdam, see Plate XCV.

The foundations of many bridges in England have been laid by means of cofferdams, so nearly similar to those which have just been described, that noticing them here would lead us into repetition: We shall therefore proceed to the second mode.

2. In constructing a bridge upon the river Severn, at Bewdley, in Worcestershire, designed by Mr Telford, and executed under his direction, Mr John Simpson of Shrewsbury, (who built the bridge by contract) constructed a cofferdam, which answered the purpose perfectly well. Here the low water was five feet in depth, for 7 feet more there was gravel and rubbish, and under that a sand stone rock. The floods rose about 10 feet. In Plate XCVI., Figs. 1, 2, 3, the plan, section, and side view, will shew distinctly the manner in which the cofferdam was constructed. The chief peculiarity is, that the sides and ends were formed on the shore, by laying the planking horizontally along upright piles, and dowselling them together; they were then floated off, fixed against main piles previously driven, and there secured by cross braces. About five feet without these a similar inclosure was made, and the two secured together by iron bars in the middle of the height, and wooden braces at the top. The space between them was filled with clay in the usual way. Before the space for the foundation of the masonry could be wholly cleared down to the rock, it was found necessary to put down some small piles along the edge of the gravel, next to the outer edge of the stone work.

In the same Plate, Figs. 4, 5, represent the plan and section of a cofferdam, used in under building one of the piers, and also the eastern abutment of Pulteney bridge, in the city of Bath. The operations here were rendered peculiarly difficult, by several previous ineffectual attempts; they were at last successfully accomplished by Messrs Simpson and Cargill, employed for that purpose by Mr Telford. This work much exceeded in difficulty those in Languedoc, so minutely described by M. Gautier, the French engineer, as very extraordinary efforts of art.

A still simpler mode of constructing cofferdams has been practised in Britain: that is, by driving guaging piles, about 12 inches square, at the distance of about 10 feet from each other, and about five feet from the edge of the intended platform. They are driven from 5 to 7 feet into the bed of the river, so as to be about 3 or 4 feet below the level of the platform, and rise about 3 feet above low water. They are grooved to receive the pile planks, and a leading beam, 6 inches by 9 inches, is fixed about a foot below their top on the inside. These beams are notched on the guaging piles, so that their outer edge is in a line with the inside of the groove for the pile planks. The whole of the pile planks, which fill a space between the guaging piles, are entered together, and the middle pile has a wedge-form narrow-

VOL. IV. PART II.

est at the bottom. The pile planks receive a few strokes alternately, so as all to be driven nearly together, while the middle one wedges the whole, and makes the joints water tight. They are driven about three feet below the platform, and the whole properly braced. The water being pumped out, and the ground cleared, piles are driven about two feet and a half distant from centre to centre, over the whole foundation; those near the middle being driven 7 feet 6 inches below the platform, and 8 inches diameter; those next the outside 9 feet long, and 10 inches diameter. Immediately under the outer edge of the platform, grooved guaging piles are driven about nine feet distant from centre to centre, and nine feet in depth. Nearly in the same range with these, common round piles are also driven. Upon the latter, a leading beam, 12 by 8 inches, is fixed, which also embraces the guaging piles, and guides the pile planks which were driven around the platform. The bearing piles may be considered as sufficiently driven, when by 30 blows of a proper ram they are not driven one inch, and 40 blows for driving the sheeting piles the same distance. See Plate XCVII. Fig. 1. Along the top of each second row of piles, under the body of the pier, a beam, 12 by 6 inches, is laid, reaching quite across, and dovetailed into the beams which surround the platform. The spaces between the beams are filled up with masonry. Upon this platform the regular courses of masonry are laid.

In whatever manner the cofferdams are constructed, there should be means provided to discharge the water near the level of low water of the river, instead of raising it always over the top of the cofferdam; and there should also be a sluice near the level of the bed of the river, to fill the cofferdam in case of any defect appearing in the dam, or any risk of a flood rushing in too hastily.

OF CAISSONS.

With regard to laying foundations by means of caissons, this mode was first practised in England by that able engineer Mr Labelye, at Westminster bridge. In the sequel of a brief report relative to this work, (edition 1751,) he announced an intention of publishing a larger report, with plans and designs, calculations and details. This, however, never appeared; but most of the essential materials have been preserved by Mr Thomas Gayfer, a venerable old gentleman, aged 90, now living in Abingdon-street, Westminster. He was senior apprentice to Mr Jelf, the mason first employed on Westminster bridge, and was specially appointed to make working plans and models, and to be attendant on Mr Labelye's own directions; and when Mr Tufnel succeeded Mr Jelf, Mr Gayfer was continued in the same capacity till the bridge was finished. From his manuscript narrative and drawings, which he has allowed to be in part copied for this work, will be seen the injustice to which engineers subject themselves by not publishing their designs,—most of Labelye's inventions having been copied, without acknowledgment, by others, who have since constructed large bridges, and to whom they have rendered similar operations a comparatively easy task.

By this valuable manuscript we are informed, that at the situation fixed for the bridge, in the ebb channel on the Surrey side, there was 6 feet at low water; in the flood channel on the Westminster side, 5 feet 9 inches, and on a shoal between them, 4 feet; also that the rise

of tides at extra springs, with land freshes, was 15 feet; neaps 7 feet; and at a mean tide 10 or 11 feet;—that the velocity of the surface was something greater with the tide of flood than that of ebb;—that with the former it was about 3 feet per second, with the latter $2\frac{1}{2}$ feet;—and that the piers were laid about five feet below the bed of the river. About the middle, and at five feet under the bed of the river, the gravel is 14 feet deep: this continued from the Westminster side $\frac{2}{3}$ the width of the river. The other fourth part, next the Surrey shore, is a loose sand and mud.

They commenced the operation by driving fender piles to keep off the barges. These were 34 feet long, 13 or 14 inches square, and driven 13 or 14 feet into the bed of the river. They were placed 30 feet from the pier, and 7 feet asunder, and were connected by floating beams. For the first large pier there were 34 of these piles, for the others 26. They were driven by an engine constructed by M. Vauloue, a watchmaker. The weight of the ram was 1700lbs. After the engine had worked for some time, it was found, that by three horses walking at an ordinary pace, when the ram was raised only 8 or 10 feet, 5 strokes were made in two minutes.

The foundation was formed by scooping the mud in the usual way of raising ballast in the Thames at that time. When they came to the gravel, it was raked level. The gauge for proving the foundations, was a stone 15 inches square, and three inches thick, fixed to a graduated rod 18 feet in length. The rod was painted red, and the figures white.

In order to prevent the current from washing the sand into the pit, short grooved piles were driven before the two ends and part of the sides, not above 4 feet higher than low water mark, and about 15 feet distant from the caisson. Between these piles, rows of boards were let down into the grooves to the bed of the river.

The length of the caisson from point to point (the shape corresponding with that of the pier,) was 80 feet, the breadth 30 feet, the height, including the bottom, 18 feet. The sides were formed by fir beams laid horizontally upon one another, and pinned with oak trenails. They were framed, and had oaken knees bolted and screwed at all the angles, except the salient angles, where they were secured by iron work, which being unscrewed, permitted the caissons, if necessary, to part in two halves. The sides were planked across the timbers, both inside and outside, with three inch planks; the thickness of the sides was 18 inches at the bottom, and 15 inches at the top. The bottom was also formed with beams, with three inch planking across their under sides, and timbers nine inches thick across their upper side, making the whole two feet in thickness. Upon this bottom, around the outer edge, a strong curbing was fixed, to prevent the first course of stone from pressing against the sides. All the joints, both of the sides and bottom, were caulked and pitched.

The sides were fastened to the bottom by 28 pieces of timber, 8 by 9 inches, fixed on the outside, and 18 within, reaching to, and lapping over the tops of the sides. The lower end of those pieces had one side cut dovetailed, to fit a mortice made in the outer curbing of the grating of the bottom, and they were kept in their places by iron wedges. The bottom grating extended 5 feet beyond the face of the upright shaft or dado part of the pier.

The caisson being launched and fixed exactly over the place with cables fastened to the adjacent piles, the masons laid the first course of stones within it. This done, a sluice made in the side was opened near low water, on which the caisson sunk to the bottom; if it did not set level, the sluice was shut and the water pumped out, so as to make it float, till such time as the foundation was levelled. The masons cramped the first course of stones, and laid a second course; which being likewise cramped, a third course was laid: then the sluice being opened again, proper care was taken that the caisson should sink in its proper place. The stonework being thus raised to within two feet of the common low-water mark, about two hours before low water the sluice was shut and the water pumped out by four pumps, eight inches square, each worked by eight men, and a small pump three inches square, worked by two men, so that the masons could lay the next course of stones; which they continued to do till the water was risen so high as to make it unsafe to proceed any farther; then they left the work and opened the sluice to let in the water. Thus they continued to work night and day at low-water till they had their work some feet higher than low-water mark; after this the sides of the caisson were loosened from the bottom, which made them float, and they were carried ashore to be fixed to another bottom for the next pier. See Plate XCVIII.

A few years after Westminster bridge was completed, that over the river Thames at Blackfriars was begun, from the plans and under the directions of Mr Mylne, who followed the example of Mr Labelye, by laying the foundations by means of caissons. The sides, ends, and bottom were constructed in a similar manner to those at Westminster, but the form of the caisson was rectangular, the length was 86 feet, the breadth 33 feet, and the height, including the bottom, was 29 feet. The sides were fastened to the bottom by strong iron straps, six on each side, and three on each end; each of them were about 20 feet in length: on one end a part about 10 feet in height above the bottom was fixed on hinges. At about 16 feet above the bottom, there was a floor to strengthen the sides and ends, and to receive a mill for working a chain-pump. There was another floor level with the top; one end of this was sunk a little to receive the capstan for lifting stone; over this capstan there was an awning to protect the workmen; upon the highest part of this floor was placed a triangle for raising stones, and a windlass for raising mortar. On each side of the caisson were four upright pieces of timber, which formed part of triangles to be connected with barges for lifting the caissons. When the masonry was built up to the level of low water, a barge was laid along each side of the caisson at low water, and fixed to the upright pieces; when the tide rose, the iron straps, and the moveable piece at one end, being disengaged, the barges lifted up the caisson, which, when raised to clear the bed of the river, was floated off. This mode of removing by barges became necessary, from the height of the caisson, and having floors and machinery constructed on them.

Mr Mylne caused piles to be driven into the bed of the river, and cut off level with the surface of the space which had been excavated for the foundations of the piers.

In a river where a caisson of 6 feet in depth only was

required, Mr Smeaton, with his usual ingenuity, contrived one of corresponding simplicity: (Plate XCVII. Fig. 2.) The bottom consisted of two thicknesses of three-inch planks laid crossing each other, the sides and points calculated just to clear the masonry of the lowest course a few inches. They were composed of three-inch planks, grooved and tongued, level with the top; and all round the inside of the planking was a frame of timber, nine inches broad by six inches in thickness. At about two feet six inches below this was another frame six inches square; around the outside of the planking, and rather above the level of the bottom, was a third frame nine inches by three. To all of those frames the planking was firmly bolted, the sides were fixed to the bottom by iron rods, which, passing through the inside frames, had each two of them their lower ends entered into an iron socket, which was let into the upper planking of the bottom, and secured by screws passing through both planks. The socket had one side perpendicular and the other dovetailed, and the ends of the rods were made to fit it, their upper ends passed through the upper curbing about nine inches from each other, and were secured by screws and washers on the upper side of the frame. The spreading at the top tended to render their hold in the socket firm, and when the sides were to be raised it was only necessary to unscrew the nuts. Across the top of the caisson there were seven ties of timber, each 12 inches by 6.

In some cases, in very deep water, where the bed of the river, though soft, is nearly level, or can be made so, a very strong grated frame of timber, much larger than the foundations of the masonry, may be let down by placing great weights around the edges of it, and having piles driven to keep it in its place, a caisson may be sunk upon it. This, when once settled by the weight of the pier, stands as well as if piles were driven under the bottom of the caisson. Sometimes pile planks should be driven round the frame.

We learn from the work of L. A. Cessart, that the mode of laying foundations in deep water, by means of caissons, was not practised in France till the year 1757, when M. de Voglio and himself (encouraged by Perronet) introduced it with success at the bridge of Saumur, after the manner of Labeleye.

Having detailed the different modes which have been practised by eminent engineers upon large rivers, it may be useful to young artists to mention, that in smaller rivers, where the foundations are to be laid on firm gravel, mud, or quicksand, it is frequently necessary to drive a row of dovetailed three-inch pile-planks around the pier or abutment, from five to ten feet in length, according to the nature of the ground, and lay some clay round the outside of them; then to excavate the foundation about two feet below the level of the bed of the river, and lay down sills nine inches by six longitudinally, at the distance of about four feet from each other, filling up the spaces between them with rubble masonry; upon this to lay two thicknesses of three-inch planking crossing each other, and pinned with oak trenails; around the outer edge of these, and immediately without the first course of masonry, to fix a curbing six inches by four, to which, after the masonry has been built up to the level of low water, and the clay removed from them, the pile-planking should be fixed by spike nails, and cut down to nearly that level. If the ground is very soft and loose, it is also necessary to drive piles under the platforms. In some instances, besides the plat-

forms under the piers and abutments, gratings filled with masonry, and covered with planking, have been carried quite across the bed of the river. M. Blondel performed this in the bridge of Xaintes upon the Charente. In a bridge over the Liffy, in Dublin, Mr George Semple carried a solid mass of masonry across the bed of the river, between the piers. Inverted arches have also been made between the piers, and more especially between the abutments, in the case of having one arch only across the stream.

Excavations for the foundations and gratings in deep rivers can now be much more expeditiously performed by the improved dredging machines, worked either by horses or steam engines.

Having completed the cofferdams and caissons, it is, in large works, an important consideration to have a perfect command of the water which may rise within them. The modes formerly employed were hand-buckets, or pumps worked by men or horses, also water-wheels; but of late, in England, recourse has been had to steam-engines. These can now be suited to any exertion required, and are the most powerful and certain means yet devised. The gangways and scaffolding must be regulated by local circumstances, no general rules being applicable. We shall, therefore, only notice, that the labour in removing large stones, may frequently be much abridged by laying down cast-iron railways; and that much aid is to be derived from the use of properly constructed cranes. The form and properties of these will be explained under their respective heads.

To lay the foundations of piers in deep water, upon rock, and in the tideway, being a difficult operation, it becomes of serious importance to explain how it has been performed upon a large scale. We do not recollect of this having been done in a satisfactory manner in any former publication, and therefore trust the following narrative will prove interesting to those who may be connected with similar works. It affords a minute detail of every operation in the construction of a cofferdam upon rock, in deep water, and in the tide-way. It has been practised with perfect success at the western termination of the Caledonian canal, for the tide-lock built there by Messrs Simpson and Wilson, and is equally applicable to the abutments or piers of bridges.

The entrance from the canal into the tide-way having been fixed on the north-west side of a rock which projects into the sea about 100 yards from high-water mark, and which was covered at three-quarters flood, it became necessary to discover in what direction, and at what depth, it lay below the silt or mud which composed the beach at that place. By boring with augers, it was found, at the distance of 21 yards from low-water mark at the lowest spring ebbs, that the rock, in the middle of the entrance, was 21 feet below high-water neap-tides, which affording the desired depth, was fixed upon as the extremity of the space to be enclosed by a cofferdam for the sea-lock.

In the spring and summer of 1807, the earthen-bank was carried forward to near the end of the timber work for the cofferdam. The first leading frame was begun in August, and put together on the beach, near high-water mark, that it might be floated off to its situation. The first leading frame was begun by fishing together end to end, two beams 13 inches square, by pieces 20 feet long, 13 inches broad, and 6 inches thick, laid on opposite sides of the beams across the joints, and fastened

by four screw bolts, which passed through the whole. The length of these beams, when joined, was 95 feet. In order to form the sides of the leading frames, from the ends of these last-mentioned beams, two others, each 63 feet in length, were laid with an inclination to each other, that left their inner ends 65 feet apart. They were fastened to the ends of the long beam by half chucking or gaining, and two screw bolts through each corner. There was a beam 38 feet long laid across each angle, and fastened down to the front and side leading beams by screw bolts. At the height of the springs this first leading frame was floated off, and at low water adjusted in its precise situation, and sunk to the bottom by means of a number of large stones being placed upon it. A considerable degree of attention was bestowed in adjusting this first frame, because upon this depended the having the cofferdam, and, of course, the entrance and wings of the sea-lock, in a proper direction. On the upper side of this leading beam, previous to sinking it, there were mortices cut, three on each side, and three in the front, which were to receive tenons made on the lower end of the standard, which were placed upright therein, and cut off at the level of one foot below high water neap tides, in order to receive the middle leading frame. This last mentioned frame, after having been made on the shore, in all respects similar to the first, was floated into its place; but, after two or three fruitless attempts to rest it on the top of the upright standards as the tide left it, this mode was abandoned, it being found impracticable, in so strong a tide, to steady such a large frame on such low unconnected points. This led to placing a pile engine upon the deck of a sloop, and driving three piles along the front, and two on each side, all close to the outer side of the lower leading frame. Large brackets were nailed to the inside of these piles, level with the tops of the upright standards. The frame was then floated again into its place, when it rested upon the brackets, and upon the top of the standards, and was screw-bolted to the piles. Upon the second leading frame were also upright standards fixed in mortices, and cut off at the level of high water of a high spring tide. The upper leading frame was floated off and fixed upon the standards. For doing this, advantage was taken of one of the highest spring tides in the beginning of October. This frame was likewise bolted to the piles. A temporary scaffold was made above the top frame, by laying large beams across, and driving piles in the inside of the space to support them. The whole was now loaded with stones. A large pile engine was placed on the scaffold, and a number of piles driven around the outside of these frames, at fifteen and twenty feet apart from each other. They were bolted to the uppermost frame, to keep the whole steady during the winter storms.

In March 1808, the work was recommenced by putting down the main or framing piles, and fixing them in the rock by means of iron-dowels. For this operation there was first constructed a cylinder of three inch fir plank, 22 inches diameter in the inside, and eight feet long. The joints were made perfectly correct, and dowelled together; and it was hooped with flat iron bars. The lower end was shod with a circular iron shoe, fitted on the edge of the timber, to prevent it from being damaged by stones while driven down to the rock. Near the upper end, and on the opposite sides of the cylinder, two strong eyes were fixed by means of strong iron clamps, which embraced the cylinder, and were rivetted

to its sides. This was done in order to receive a strong chain to lift up the cylinder, and also for drawing it out of the sand and mud after the pile was fixed. At low water, this cylinder was placed in the situation where the centre of the main pile was to lie. At this spot there were three feet of low water, and eight and a half of silt and gravel upon the top of the rock. The cylinder being lifted by ropes fixed on the top of the pile engine frame, it was set perpendicularly on the surface of the sand, and close to the inside of the lower leading frame. On the top of it was placed a block of ash timber, two feet high; on the lower end of this six inches were turned, to fill exactly the inside of the cylinder, to prevent the block from shifting, and also to prevent the cylinder from crushing during the driving. This block was strongly hooped with iron, as was also a pile, twelve inches square, that stood on the top of it, and reached as much above the top of the upper scaffold as the cylinder had to sink into the mud. The whole were now lashed, in such a manner as to keep them perpendicular, and, at the same time, allow them to sink. The driving was then commenced with a pile engine 30 feet high, and a ram 1008 lb. At first the cylinder went freely; but, by the time it had sunk three feet and a half, it went so stiffly, that it was found advisable to begin emptying the matter out of the inside. For this purpose an instrument, named a sand auger, was made, (See Plate XCVII.) having a quadrant of a circle of the same diameter as the inside of the cylinder. The circular side, and one of the straight sides of this quadrant, for six inches high, were made close, of thin rolled iron rivetted to the ribs, which were fastened to the corners of the quadrant, from which proceeded an upright shaft, the other straight side being open. To the bottom of it four flat teeth, two inches and a half long, were fixed, with an inclination downwards; so that, when the auger turned round, these teeth loosened the sand, and prepared it to enter easily into the body of the auger. To keep it steady while turning, there was fastened to the lower side of that corner of the quadrant which is the centre of the circle, a pivot, six inches long, which passed into the sand, and served as a centre for the auger to turn upon. Immediately above this pivot stood the upright shaft, which for ten feet was of iron, one inch and a half square, and for twelve feet more a piece of ash timber four inches square. Upon this two cross handles were placed, to turn it with; and they were to slide up and down as the auger rose and fell. At five feet below the upper scaffold, where the pile engine stood, a temporary scaffold was erected, on the top of the second leading beam, where four men might stand and turn the auger. In this lower scaffold was a round hole, through which the wooden shaft of the auger passed, and kept it steady. When at work, two complete turns filled it. It was then lifted up above the water, by a purchase from the top of the pile engine, and the sand was cleaned out with a small shovel, by a man who stood in a boat for that purpose. The operations of boring and cleaning out were repeated, until the sand was taken out to the bottom of the cylinder; which was then driven farther down, and a similar operation of sand boring gone through; driving and boring alternately, till the lower part of the cylinder rested upon the rock, and all the sand was taken out, as low as the pivot would allow for the rock. There was then a frame, which fitted the inside of the cylinder, introduced into its upper end, and sunk to the bottom by means of two half hun-

dred weights. Down a square hole in the middle of this frame, was introduced a pipe, four inches square at the top, and tapered to three inches at the bottom. This was driven down to the rock through the small quantity that the auger could not clear. The sand which was inclosed by the pipe was cleared off the rock by a cylindrical iron tube, three inches in diameter on the outside, and three feet long, which had a valve fixed within two inches of the bottom, and rested on a small ring fastened in the inside of the tube for that purpose. On the top of the tube was a screw, by which it was fastened to a set of boring rods. It was then passed down the inside to the bottom of the square wooden pipe, and, by working it by short and quick strokes, the before-mentioned sand and small gravel worked above the valve by the agitation of the water. The tube was then taken up and emptied of the sand; and this operation was repeated, until the rock within the square tube was perfectly clean. It was found absolutely necessary to clear away this sand, as otherwise it entirely prevented the jumper from turning on the rock.

A jumper was then passed down the square directing-pipe, and worked by a lever on the upper scaffold, until a hole two inches and a half in diameter, and twenty inches deep, was bored into the rock, to receive an iron dowell two inches square. This dowell was fixed in its place, by fastening it into a square socket made in the end of an inch and a half square iron bar by a small cord, to prevent it from falling out of the socket while lowering down the square directing-pipe to the rock. It was driven into the hole in the rock, by striking with a large hammer on the head of the bar. When it had been driven eighteen inches into the hole, the timber was lifted by a sudden jerk, which broke the cord, and left the dowell in its intended situation. The frame and square directing pipe were then lifted out of the cylinder. The pile, previous to being let down, had two hoops put on its lower end, and a hole cut to receive the end of the iron dowell which stood in the rock. And, from the side of this hole to the inside of the lower hoop, four pieces of iron were driven into the end of the pile, to prevent the timber at the sides of the dowell from giving way, when the lateral pressure came upon the pile. On the four sides, near the lower end of the pile, pieces of timber were nailed, to increase its size to twenty-two inches, this being the inside diameter of the cylinder. By this means the hole was kept in its precise situation, and was formed to pass exactly upon the dowell. It was then set hard to the rock by a stroke of the pile engine. This completed the fixing of one main pile. A strong chain was then fastened to the top of the cylinder, and, after the main pile was wedged down, to prevent it from rising, a strong purchase of ropes and blocks was applied, to raise the cylinder out of the sand; but all the power which could be applied was ineffectual. A beam of fifty feet in length was therefore procured for a lever. The fulcrum of this lever was laid on the top of the main pile. The outer end of it was lifted up by ropes and blocks from the mast of a sloop, that was laid along the outside of the dam for this purpose. The chain from the top of the cylinder was now fixed to the inner end of the lever, and six men got on the outer end, and set it in motion. The cylinder at length started; but, before it moved, it took a purchase of nearly fifty tons. After it was worked up a little by the lever, the ropes and blocks were again ap-

plied, and lifted the cylinder over the top of the pile. The head of the pile was now forced against the inside of the upper leading frame, and a screw-bolt put through both. The whole apparatus was then shifted to the situation of the next main pile, and similar operations took place, until the whole of the main piles were fixed, excepting in some instances where the sand was shallow, and then the cylinder was lifted without employing this enormous lever.

The main piles having been all properly fixed at the bottom, and fastened at the heads, temporary leading beams were bolted on the outside of the piles formerly described as driven 15 or 20 feet apart, all round the outside of the main leading frames. These spaces were now filled up with piles set close side by side, and driven down to the rock: then the lower temporary leading frame was taken off, the upper one being left to steady the piles until the puddle was brought up in the cofferdam. The inside braces were now put in; they rested upon brackets fastened to the main piles, and also upon the tops of these piles which were driven to the rock under the main-stretching brace. The braces were besides prevented from floating, by brackets nailed above them, and by stones laid on temporary scaffolds. The outer row of piles, in front of the cofferdam, was begun by placing a pile engine on a float made of large fir logs from 40 to 50 feet long, and one foot square. These were fastened together by half logs spiked across them. The width of this float was 14 feet, which just filling the space between the rows of piles, was thereby kept steady; and this was also the means of getting readily into a straight line the outer row of piles which stood at twenty feet apart. These being driven, a long leading beam was made by fishing, as formerly described, and bolted to the outside of these piles on a level with the inside leading frame. A temporary leading beam was then fixed on the inside of the outer row of piles, one foot lower than the outside beam; there was then a scaffold erected on the top over the space between the rows of piles, by which means were taken to secure the outer piles from any motion they might otherwise have had with the tide. The piling engine was next got on this scaffold, and an outside leading beam bolted at the same level with the middle leading frame on the inside. The space betwixt the first-mentioned piles was now filled up by others set close together and driven down to the rock; by the time the outside and two return rows of piles at the angles were all driven, the bank and puddle at each side of the dam was brought forward to the front of the inner row of piles.

The connecting bolts were now put in, one through each main pile, opposite the middle leading frame, through which it went, also across the puddle, and through the front leading beam on the outside of the outer row of piles. These connecting bolts were fastened by a strong cotterel through each end, with a strong iron-plate under them. There were likewise two of these connecting bolts through each main pile in the front of the dam; one through the middle leading frame, and the other one foot below low water common spring-tides, at which place the lowest leading beam on the outer row of piles was fixed. The two rows of piles were kept together at the tops by means of a piece of strong timber being gained on the side of each main pile on the inside of the dam, and being spiked down on the outside leading beam.

This description, with the representation in Plate XCVII. will, we trust, convey a distinct notion of the progress of this difficult operation. The description may, no doubt, to some appear minute, but those engaged or interested in similar works will not think it more than sufficient; and we consider it a fortunate circumstance, to be enabled to furnish so minute and faithful an account of it.

OF PIERS.

The piers of most of the ancient bridges in England were made of great thickness, in proportion to the span of the arches which they sustained. In London bridge some of them are larger than the original openings of the arches.

These piers consisted of small rubble stone laid in lime-mortar, surrounded merely by a thin casing of squared stones. It is probable that the Roman bridges, whose piers were said to be equal in thickness to one half the span of the arches, were constructed in the same manner. But these piers occupying so great a proportion of the breadth of the river, either raise a head, and tear up the bed, or cause a very great widening of the banks. In order to avoid, or as much as possible to lessen these inconveniences, the piers have been reduced in thickness, and constructed wholly with squared stones, each course being of equal height quite through the body of the pier. In Bewdly, Conon, Dunkeld, and Lovat bridges, Mr Telford has made them from about a seventh to less than an eighth part of the span; and at Neuilly, Mr Perronet has given only one-ninth part of the span to his piers. All these measures are taken at the springing of the arches.

In discussing the principles of bridges, it has been demonstrated, that the thickness ought to be regulated by the span and rise of the arches, combined with the height of the piers; we have therefore cited the before-mentioned examples, merely as being some of the narrowest already practised with success on a large scale, but upon which engineers ought in future to improve.

In determining to what height piers ought to be carried, great attention should be paid not only to the highest points to which, from the best evidence, the water appears to have risen, but also to the nature of the country where the bridge is situated. If, in the course of the upper part of the river, there are large lakes, or if the adjacent country is very flat, there can be no risk of the flood rising to a very great height; but if there are no lakes in the course of the river, and if the bridge is placed where the adjacent country on each side is above its level, then the floods being thus confined, may possibly rise to a still greater height than has been formerly noticed. For example, in the rivers Ness and Lochy in Scotland, which in their upper parts are connected with large lakes, the floods never rise more than four feet above the level of low water; but in the river Clyde, where there are no lakes, the floods have lately, near to Glasgow, risen 20 feet; and the river Severn, in England, since it has been embanked in the low lands in Montgomeryshire, has frequently, in some parts of Shropshire, risen 15 feet.

Unless the bed of the river consists of rock, or is completely protected by inverted arches or well-constructed causeways, it is advisable to raise the piers as near to

the line of ordinary floods as due regard to the arches and access will admit of; and at all events to avoid finishing them under the line of ordinary low water.

The dimensions of the piers having been determined, the next step is to consider their shape. The portion of pier which supports the arch is usually of an oblong form, with its sides right-lined and parallel; under low water, the pier increases in breadth downwards to the fountain, at the rate of from one inch in the Pont Royal to nine inches in the bridge of Neuilly, for every foot in height, and the platform extending from two to six inches beyond the masonry. The rate of this increase of breadth must be in some measure regulated by the nature of the foundations, and the proportions which the body of the pier bears to the span of the arches. In Neuilly, the thickness of the pier being at the springing of the arches only one ninth of the span, it became necessary to spread the base, in order to embrace a considerable extent of ground; but as in practice it is not easy to get the workmen to make the back part of the beds of the outside stones equally perfect with that which is near the face, these large offsets throw too much of the weight upon the imperfect workmanship of the beds, and should therefore be avoided. An increase at the rate of three inches for every foot in height, appears preferable, and has been adopted in several of the British bridges. Large offsets certainly afford an opportunity of supporting the centres very advantageously; but this may be sufficiently obtained by having them three or four inches in the stone-work, and making the wooden platform to project considerably more around the pier. The shape of the points of the piers are, 1st, Acute-angled; 2d, Right-Angled; 3d, Semi-circular; and 4th, Having two segments of a circle intersecting each other. The 2d and 4th seem the preferable modes. These projecting points usually diminish from the line of each side of the piers, though we have seen them formed upon a narrower base than the breadth of the pier, leaving a square projection on each side; but these projections obstruct the current, and cause a head which frequently injures the foundations. In the case of St Maxence, Perronet has departed from the right-lined figure, and also divided the body of the pier longitudinally into two parts, leaving an opening between them equal to their thickness; but as every water conduit should have its sections equal, and its course as direct as possible, this mode seems very objectionable; it likewise diminishes the strength of the pier: and as he has made an inverted arch under the openings; to embrace the whole foundation, the saving of masonry, when compared with the whole mass, is very trifling; and, with due deference to that able engineer, we cannot help observing, that, in point of taste, a work which is to convey an idea of durability, should rather have the appearance of stability towards its base, and diminish as it ascends.

Each course of stone around the outside should be laid header and stretcher alternately; the stretchers should be from 18 inches to two feet in breadth; and the headers, which should be about one third of the whole face, should each be from three to four feet in length: their upright, or end joints, should be correctly squared, at least one foot in from the face, and in no part be more than one inch in width. The interior, or filling in stones, should be of equal height to the outside stones,

and have their upright joints not more than one inch in width: they should break joint at least one foot. The first, and all the succeeding courses, should be laid flushed, both their bed and upright joints, in proper mortar. The French engineers allow from two to four and six lines for the thickness of the outside mortar joints: in England about an eighth of an inch, when compressed, is usual. All the joints should be run full of grout, where there is any vacancy after the first operation. The French cramp all the outside stones with iron cramps, from 15 to 18 inches in length, run and covered with lead; but if the masonry be composed of large stones, well worked, and laid to break joints properly, iron cramps appear an unnecessary expence. Great care should be taken to select the hardest and most perfect stones for the projecting points of the piers, especially those on the upper side of the bridge. The points should be carried up at least to above high water mark, and at that height they are usually finished by sloping them back to the face of the spandrels. In some cases, a projection of a circular or polygonal form is carried up to the level of the roadway. The courses of stone may vary in thickness, 18 inches being a good average.

The abutments are managed in the same manner as the piers, only their backing is in general made of good rubble stone, laid in lime mortar. This rubble work must be levelled and grouted at the height of each course of square masonry; great care being taken to have the whole properly bonded and connected together. If the bridge is wide, a buttress, or counterfort, should be placed behind the middle part of the abutment. This should be made of rubble work, well bonded into the body of the abutment; and having, besides, thin hoop-iron, laths, or half-inch boards, laid in as they are carried up. This is a necessary precaution in all large buttresses constructed with rubble stone.

After all the precautions which can be taken to secure the foundations of piers, accidents sometimes happen to the best constructed works. In the bridge of Orleans, though conducted by the best engineers in France, one of the piers sunk 18 inches, French measure, although the foundation had shewn no symptoms of being worse than the others. The points did not sink with the body of the pier, but both the masonry and platform broke off at these points. The pier was loaded with 1,200,000lbs. for five months. The points were then taken down under low water and rebuilt. This was in 1759; we have not heard of its sinking more. But, in 1761, the water having swept away about two feet from the piers, induced them to drive two rows of piles quite across the river, six feet distant from the lower points of the piers, and fill in rubble stone.

In 1747, one of the piers of Westminster bridge sunk 18 inches at one end, which caused the taking down of two arches. The pier was loaded with 700 tons, or 1,568,000lbs. It was cased round the foundation with strong piles, to prevent any more gravel running out. The pier was taken down for some distance under low water, and rebuilt level; the two arches were also rebuilt; but, to lighten the pier, arches were constructed in the spandrels, and the same was afterwards done at Orleans.

At Orleans, the cause of the sinking of the pier was not discovered. At Westminster, it took place from there being no piles under the foundation, and from the

ballast men lifting gravel for covering the bridge too near to the foundation of the pier. This circumstance ought to prove a caution to engineers, never to leave unprotected, a foundation composed of gravel, sand, or mud.

OF CENTRES.

Having carried the piers and abutments up to the height at which the arches are to spring, the next object is to set up timber frames, usually known by the name of centres. To construct and erect these in a judicious manner, is one of the most masterly operations in bridge building; but as this forms also a principal feature in CARPENTRY, we must refer the reader to that head, under which he shall find the subject fully discussed; and at present content ourselves with giving drawings, and very general descriptions of centres, which have been used in constructing some of the principal bridges in Britain and France. See Plates XCIX. and C.

In a centre, the principal objects to be kept in view, are to construct and fix such a frame as shall support the weight of the arch-stones, through all the progress of the work, from the springing of the arch, to the fixing of the key-stone, without changing its shape, and to admit of its being removed with safety and ease. From inspecting the Plates, it will be seen that the French engineers brought the timbers of each frame very near together, and kept them very narrow at the footing upon which they rested; whereas, in England, it is the practice to place the timbers more apart, and extend the footing. The comparative merits of these principles will be discussed when treating of CARPENTRY; but we are warranted in observing, that the English centres have succeeded best in practice. At Neuilly, previous to the centre being eased, Perronet states, that the arch (of 120 French feet) had sunk 13 inches, and it afterwards sunk $10\frac{1}{2}$ inches more, making in all $23\frac{1}{2}$ inches. At Mantz, (also 120 French feet span,) before the centre was eased, the sinking was 12 inches, and it afterwards increased to $20\frac{1}{4}$. In Britain, no such imperfections have ever been known. In the largest arches constructed with cut stone, under the direction of experienced persons, the sinking has been scarcely discernible. In Dunkeld bridge of 90, Tongueland of 118, and Aberdeen of 130 feet span, the sinking has never exceeded three inches, consequently no derangement of general form or of joints took place. In rivers where there is no navigation, or where there is no risk from the floating down of ice or timber, the centres are framed with horizontal tie beams, and supported in sundry places by frames or piles fixed in the bed of the river; and, in old bridges, corbels of stone were frequently placed in each abutment, to receive the beams of the centres. But when any of the before-mentioned inconveniences are to be guarded against, the frames are trussed so as to leave a large proportion of the space in the middle unobstructed. In this case, more art is required in framing and placing the centres, so as to afford effectual support, and admit of a perfect mode of lowering and removing them. The offsets of the stone work and platforms, afford the most substantial abutments for the supports; but unless the bed of the river is very soft, great advantage may be derived from also placing frames or piles at a small distance from the body of the pier; and as in large arches this operation

cannot incommode the navigation, it ought to be made use of. The modes of lowering or easing the centres practised in Britain, appears to be much more simple and safe than those described by Perronet, as practised in France. In France, the bridgings across the frames, upon which the archstones were set, were cut away, either beginning at the springing, and proceeding regularly upwards to the key, or otherwise by first cutting out each other bridging, over the whole centre, and next, each other that was left, and so alternately, until the whole were removed. In Britain, the centres are set upon beams; between the centres and the beams, wedges are introduced, sometimes in separate pairs across, under each frame; sometimes the wedges are formed or fixed upon one piece of wood, which reaches across the whole width of the soffit, passing between all the centre frames, and the supporting frames or beams; and, lastly, the wedges are formed or fixed upon a piece of wood, which is placed longitudinally under the foot of each centre frame, and resting also on the supporting frame. When the centre is to be eased, these wedges are driven along each other, or the pieces of wood on which the wedges are formed or fixed, are driven back so that the wedges are moved along each of their inclined planes into larger spaces than they had before occupied. In all these cases, the whole centre is made to descend very gently, and may be suffered to rest at any part of the operation. The mode of striking the wedges is varied according to circumstances. It is, in the smaller arches, usually performed by men with mauls striking each pair of wedges. In the larger arches, such as Westminster and Blackfriars, it was performed with a beam mounted as a battering ram. The frames are placed from four, six, to seven feet apart, from middle to middle, and are secured with cross ties and braces.

When there are three arches, two centres will be required; and when there are five arches, three centres will be needed. See page 542.

OF THE ARCHES.

The centres being placed, and properly secured, the setting the archstones is proceeded with. The masonry of the piers and abutments, near to the springing, is carefully adjusted; and it is usual, immediately under the commencement of the curvature, to lay a capping, string, or cordon: this, by having a small projection, covers any trifling inaccuracy which may have taken place in setting out or carrying up the abutments and piers. If the courses have hitherto been worked with horizontal beds, the upper bed of this capping course is sometimes made to suit the radius of the arch. After the general form and dimensions of the arch have been determined, the form and dimensions of the archstones is of the first importance, for it is upon them that the great feature of bridge building depends. The nature of the different forms into which they have been, may, or ought to be made, have already been fully considered when treating of the principles of bridges; we shall therefore now only simply state various instances where different sizes have been practised in great works.

Country.	Particular bridges.	Span.	Rise.	Depth of the archstones at crown.		Engineers.
				Ft.	Ft.	
French.	Pont Royal.	72	24	4	and 5	Mansard.
	Blois.	81	27.6	4.3	and 5	Sieur Gabriel.
	Orleans.	100	30	6		Hupeau.
	Neuilly.	120	30	5		Perronet.
	Mantz.	120	35	6		Perronet.
	Nugent.	90	28	4.6		Perronet.
British.	Westminster.	76	38	5		Labeyle.
	Blackfriars.	100	43	5		Mylne.
	Tongueland.	118	38	3.6		Telford.
	Dunkeld.	90	30	3.2		Telford.
	Conon.	65	21.8	2.6		Telford.
	Bewdly.	60	20	2.2		Telford.
	Llanrwst.	58	17	1.6		Inigo Jones.

From the foregoing examples it will be seen, that the French have uniformly used very deep archstones, for their outside or headers are many of them more than those here described for the body of the arch; and this circumstance, no doubt, joined to their wide mortar joints, led, in some measure, to the enormous sinking of their arches. In Westminster and Blackfriars, the archstones are equally deep; but by the dimensions of those in Tongueland bridge, near Kirkcudbright, viz. 3 feet 6 inches, it may be observed that no such depth is necessary; for here in an arch of 118 feet span, erected over a river, where, besides about 10 feet depth at low water, the tides rose above 16 feet, which of course rendered it somewhat difficult to fix and preserve the centering; yet no sinking took place to open the joints, and the whole arch has ever since remained stable and perfect. Also in Dunkeld bridge, the arch of 90 feet span has archstones 3.2 deep, which are also quite sufficient. No doubt the mode of managing the spandrels in both cases should also be taken into account, but we are persuaded, that archstones are, in general, made much deeper than necessary; and on account of the unnecessary weight and expense incurred by this practice, we consider it our duty to draw the particular attention of the young engineer to this point. He may, in the instance of Llanrwst bridge, observe, that our British Palladio (Inigo Jones) has long ago shown us a bold example, which has stood the test of 174 years. In Llanrwst bridge, the middle arch of 58 feet span, 17 feet rise, and 14 feet in width across the soffit, the archstones are only 18 inches deep. We have carefully examined this arch and can assure the reader, that it is not from the peculiar excellence of the workmanship it derives any advantage. The archstones vary in thickness from 5 to 16 inches; many of them are 8 and 9 inches. There are, in some instances, two headers to answer one course of common archstones, and in others two courses of archstones to answer one header. The masonry of the spandrels is very irregularly laid; and as a complete proof of the stability of the middle arch, from a defect in the foundation of the west abutment, one of the side arches fell, and was rebuilt in 1703, but the others remained uninjured. The piers are 10 feet in thickness, and the arch springs about 3 feet above the bed of the river. The road over the bridge is certainly too steep, and thereby no doubt lessens the weight upon the side

arches; but we are convinced, that the road might be made with a declivity of 1 in 24, and the same degree of lightness preserved, by constructing the spandrels hollow, in the way which will hereafter be described, instead of filling them up solid as they are at present. We are more particular in describing this bridge, because of the authority it derives from the celebrity of its designer, and the length of time it has endured.

From 2 feet 6 inches to 4 feet, is a good length for the face or soffit of the archstones. When they are longer, as the beds can scarcely ever be worked and set exactly true, they are apt to break when the weight comes upon them; and when shorter, there is not sufficient space to overlap or break the joints properly. Each course should be of equal thickness quite through between the headers. The thickness of each course should be from one-third to one-half their depth, and they should be chamfered or rusticated along the bed joints, and also those of the outside heads. The beds should be worked as true as possible for the whole breadth of each stone, the neglect of which destroys every other precaution. Each stone should be laid so as just to swim in the mortar, and be struck with a maul two or three good blows. The joints of the headers should be of equal thickness with those of the other stones in the same course. Inexperienced masons, by laying the headers with thinner joints for show of fine work, frequently create an unequal pressure, which bursts or splinters the headers, before the interior archstones come to an equal bearing.

The French clamp the headers with iron to the interior archstones; but if the masonry is good, this seems totally unnecessary, nor is it practised in Britain.

In setting the archstones, care should be taken to keep each course pointing in the direction of the radius; and in order to enable the workmen to do this correctly, the thickness of each course should be marked upon the outer ribs, and its line of direction upon the lower part of the beams of the same ribs. Attention must also be had to carry on the courses equally on each side of the centre, and also to carry up masonry over the solid part of each pier in the spandrels. If this is not attended to, too much weight on one side will derange the form of the centre; and there is sometimes a necessity to lay some temporary weight upon the crown of the centre, until the load approaches the middle. In case of more arches than one, and the arches flat, care must be had not to expose one side of the pier until it has a sufficient weight upon it, or is guarded by resistance on the opposite side. At the bridge of Mantz, by a neglect of this sort, one of the piers was pushed $4\frac{1}{2}$ inches out of the upright. It was afterwards by loading the opposite side, made to return $2\frac{1}{2}$ inches.

The keystones should be driven to fill their places firmly, but not so as to require much force, otherwise they will derange the rest of the joints, and alter the shape of the arch. As soon as the keys are driven, all the back and end joints of the whole arch should be carefully examined; and if from the drying of the mortar, or defect of any of the stones, some vacancies appear, they should be run full of mortar, and firmly wedged with slates; the whole should then be left for some time to dry and indurate. The length of this time must depend upon the state of the weather, the qualities of the stone, and also the mortar. While this operation is going on, the masonry should be brought up in the spandrels to the level of about $\frac{1}{4}$ of the rise of the arch. This may

be of rubble work, but it should be laid closely, in regular courses, in good lime mortar, and abutting firmly against the archstones. The outside stones should, in the part over the pier, be carried up to the same height; but immediately adjacent to the archstones, they should be stepped or racked back, and left so until the centre is removed, because if finished close up to the back of the archstones, the least sinking of the arch would cause a fissure. The spandrels having been carried up to the proper height, and the mortar having acquired a proper consistence, the centre may be eased and removed in the way formerly described.

The centres having been removed, the soffit of the arch should be carefully examined, and the joints if necessary, pared, cleaned out, and pointed with mortar. The advantage arising from chamfered or rustic joints will now appear: they prevent the edges from chipping, and cover any trifling inequality, so that it is the cross joints only which require paring: the chamfered joints also give an appearance of lightness to the archstones. It is sometimes the practice to lay around the arch a thin course of stone, plain or moulded on the edge, which projects a few inches below the face of the archstones. This becomes necessary if the headers have any twist, because it admits of the spandrels being set correctly straight, without showing the twist or other defect.

OF SPANDRELS AND WING WALLS.

When the arches have been completed, and the centres removed, the points of the piers are brought up, and are either finished at some distance above high water mark, by sloping them back to the face of the spandrel, in either a triangular or circular form, or they are disposed, so as to receive columns, pilasters, circular, or semi-octagonal turrets; in all of which shapes very excellent works have been constructed. The two latter modes afford greatest stability to the superstructure in acting as buttresses, and on this account they agree more correctly with edifices of this kind. It is needless to observe, that in whatever way the points of the piers are terminated, it is absolutely necessary that it be with stones of good quality, firmly connected with the spandrels. The spandrels of arches have been finished in a variety of ways: in many of the old bridges they were filled up with earth, or gravel; and in small bridges the masonry should be brought up to the level of about one fourth of the rise of the arch, and then be sloped up to the top of the back of the archstones, and the remaining space filled up with gravel or stone rubbish, (not clay). In the large French bridges, they have been filled up entirely with rubble masonry; but this throws an unnecessary weight upon the arches. To remedy this, arches have been made sometimes quite through, and kept open, and sometimes concealed; and in Westminster, and Orleans, vaults have been constructed to lighten the piers which sunk, and those adjacent to them; but as these arches are easily deranged by any settlement of the main arch, and by that means rendered injurious rather than beneficial, another more simple and effectual way has been devised. This has been practised with perfect success in Tongueand bridge of 118 feet span, and Dunkeld of 90, as well as in many other instances, and ought to be generally adopted in all bridges composed of large arches. This mode consists of building walls longitudinally: they are founded

upon the solid rubble masonry, which has already been described; and increasing in length as they advance in height, they rest upon and abut against the backs of each row of archstones, and act as struts between them. These walls are placed from two to three feet apart from each other, and are made from 18 inches to three feet in thickness, according to their height, and the nature of the materials of which they are composed. They are kept steady, by laying long stones occasionally across from one wall to another. The outside spandrel walls, running parallel with these, and being connected with them by long stones, become a part of the general frame. These walls are all carried up to near the level of the top of the archstones, where they are covered with two rows of flat stones where they can be procured, or where that is difficult, the openings are arched over, (Gothic or pointed,) to lessen the lateral pressure. Sometimes the middle openings are arched, and those next the outside covered with flat stones. Small openings are made in those walls, upon the top of the rubble masonry, through which any water that may fall into, or be by any means collected in the spandrels, is conducted to one point, where it issues through a pipe inserted in the archstones. Small doorways are also made through the walls; and by a hatchway constructed in the top pavement, a person may, at any time, descend, and examine the state of the interior parts of the spandrels. See Plate CI.

The outside walls are usually made thicker than the interior walls: they are generally in good bridges faced with square masonry, and have a rubble backing. The facing is composed of headers and stretchers, the latter being from 15 to 18 inches in breadth, and the former from 2 feet 6 inches to 3 feet in length; the whole thickness of square masonry and rubble, making about $\frac{1}{2}$ of its height upon an average. When these walls are very high, a wall is also built along the middle of the piers, and abutments which cross the other, and into which they are tied by bond stones, or pieces of timber laid at about every six feet in height. When these spandrels have been brought up to the level of the top of the archstones, they are dressed into the slope which it is proposed to make the roadway, which we recommend to be 1 in 24. Here there is usually laid a cordon or fascia course, and cornice, which extends along the whole of the arches, spandrels, and wing walls. This is made varying in thickness, height, and shape, according to the fancy of the engineer; but the upper course of it should be of sufficient breadth to allow for the projection, and to pass quite through under the parapet, which will, by standing upon it, keep all the work secure; the upper side of the projecting part should have a slope or weathering, to throw off the water which will fall upon it, and the upright joints should be set and pointed with British cement.

When arches are so constructed, that each will stand independent of the others, and which appears the true principle of bridge building, the abutments are merely piers, placed next the shore of the rivers; and we have accordingly hitherto considered them as such. The French engineers, from the flatness of their arches, and the great weight of the *voussoirs* and masonry with which they have loaded them, have considered that the greatest push should be against the abutments, and have made them much thicker than the piers. In Neuilly, when the piers were 13 feet, Perronet has made the abutments 30 feet 3 inches. This appears to be a mis-

taken mode of proceeding, because the abutments, besides their own thickness, have generally wing walls behind them, upon which, by making the back of the abutments in a circular form, they will abut and be prevented from moving backwards. The wing walls have sometimes their foundations laid at the same depth as the abutments, and are similarly secured by piles and platforms. If the ground is firm, they are founded by steps rising up as they retreat. This, when practicable, saves much masonry. Their thickness is made from about $\frac{1}{4}$ to $\frac{1}{2}$ part of their height upon an average; but as the space between is filled up with earth, they should be formed in curved lines horizontally and vertically, and also have a batter of from $\frac{1}{4}$ to $\frac{1}{2}$ of their height, and this should be provided for in setting out their foundations. When the wing walls are very long and high, there should be a cross wall built, reaching between them, into which they should be tied; and sometimes vaults may be constructed between them, and converted to useful purposes.

At the terminations of the wing walls, there should be newells or pilasters; and these are made round, square, or octagonal, as is most suitable to the general design. The masonry of the wing walls is similar to what has been described for the outside walls of the spandrels.

OF PARAPETS.

The whole work having been brought up to the level of the cordon, or cornice, and that having also been set, the parapets are to be constructed. They are made from three feet six inches to six feet in height above the footpaths or roadway: four feet four inches is quite sufficient for protection and decoration, and is not so high as to obstruct the view. Parapets of the best finished bridges, consist of a plinth, dado, and coping. In their large bridges, the French make the thickness of the parapet two feet; in Britain, the dado or middle member is made only from 10 to 12 inches in thickness, and the plinth so much more as to leave an offset of about an inch on each side. If the plinth has mouldings on the upper edges, the thickness is made somewhat more. The coping is made from six to nine inches in thickness, and has projections on each side. The top is most generally made to slope each way from the middle, sometimes in straight lines, and sometimes circular; and there are instances of the slope being made in one inclination, from the inside to the outside. Sometimes the edges are plain, and often moulded: when they are plain, a cavetto or small hollow is cut in the projecting part of the bed, to prevent the water, which falls on the top, from running down the face of the dado. In or near to large cities and large towns, or near to the dwellings of the wealthy, instead of the dado being all made solid, ballusters are introduced; and these occupy a larger or smaller space, according to the fancy of the designer. Sometimes there are half ballusters on the outside for appearance, the inside being solid. There are situations which require this. The north bridge in Edinburgh being exposed to violent gusts of wind, the open ballusters were found inconvenient, and the spaces between were closed along the inside.

All the stones for the parapets should be of the best quality the neighbourhood affords: they should be worked and set very correctly. The ballusters are frequently turned in a lathe, and have spaces cut in the plinth and

coping to receive their top and bottom ends: the coping must be secured in the end joints, by dovetails, cramps, or cast iron dowells. The latter mode is the best: the dowells are four inches in length, and about one inch square: they are let into the middle of the end joints as the stones are set; the rest of the joints, especially the lower side, is made up very closely with lime mortar, or British cement, and a small perpendicular channel is cut in each stone, which, when joined, communicates from the top to the dowell: down this melted lead is poured, which fills up the space round the dowell, and also the small channel; or British cement may be used instead of lead.

The outline of the cornice and parapet should be a curve for the whole length of the bridge, which abutting on each shore, conveys a stronger idea of security, than when the top is a horizontal line; but the real advantage is the road way being kept constantly clean and dry.

In bridges when the parapets are made solid, and where proper stones can be procured, it is advisable to make each parapet of one row of stones, about three feet six inches in height, and diminishing from 12 or 14 inches at the bottom, to 8 or 9 inches at the top, which is made convex: each joint should be well secured by iron dowells.

Where parapets are made of rubble masonry, from 18 to 24 inches in thickness is required, to admit of two stones in breadth. These should be carefully bonded together, and coped, either with a course of squared stones dowelled together, or otherwise with stones about nine inches in depth set on edge. These parapets should have their top and coping curved down to the ground at each end; and be there secured by a stone of considerable size, fixed firmly under the surface.

OF THE ROADWAY.

In places of great thoroughfare, there are usually foot-paths: indeed, for the protection and comfort of foot passengers, who form the greatest proportion of mankind, footpaths ought to be made along every bridge, and also every road. Nothing can be more degrading and unfair, than that those very persons, by whose labours bridges and roads are obtained, should be mixed with, and exposed to be trampled on, by horses, or crushed by wheel carriages.

When the spandrels have been covered by arches or flat stones, it is only necessary, for the footpaths, to build with rubble stone foundations for the outside curbing. This curbing should be of hard stone, (say granite), about from 12 to 15 inches in depth; and from 6 to 9 inches in thickness on the upper edge. Their lengths should be as great as can be conveniently procured, and they should be set in lime mortar. The space between the curbing and the parapets, should be paved with hard flag stones, 3 or 4 inches in thickness, well faced and jointed. They should be laid in lime mortar upon a bed of coarse sand, or clean gravel. In large bridges, the whole of the foot-paths is sometimes covered with granite. The breadth of foot-paths varies from three to more feet: three feet will admit of one person walking with safety, four feet six inches will admit of two, and six feet of three. The top of the footpath should be from 6 to 10 inches above the bottom of the side channel. Along the outside of the curb stones, the French place borne or fender stones; but passengers, horses, and carriages, may get entangled and injured by them; it is therefore preferable to

have small paving stones set, forming an inclined plane between the outer edge of the curbing, and the bottom of the side channel: this will effectually prevent carriages from coming upon the foot-path.

If the carriage way is to be paved, there should be laid upon the covering of the spandrels, and over the top of the arches, a bed of gravel mixed with loam, about from 12 to 18 inches in thickness, worked with water into the consistence of mortar. When this has become moderately dry and firm, squared whin paving stones, about four inches square, and six to eight inches in depth, are to be set and well beat, making a curve across the road of four inches in 24 in breadth; and that curve should be terminated by sinking four inches more in the distance of two feet from the inclined plane, which has been formed along the outer edge of the curbing stones.

If the roadway is to be made with gravel only, it is necessary to lay it 22 inches in depth in the middle, and 18 inches near the sides: It should contain a small mixture of loam, so that when worked with water, it shall consolidate and afterwards exclude water. There should still be about 18 inches in breadth, on each side next the before-mentioned inclined planes, paved with small squared whinstones; because, by forming the roadway a little convex across, and with a declivity of 1 in 24 lengthwise, it is meant that the greatest proportion of water which falls on the bridge shall run along each side.

In small bridges where there are no cavities in the spandrels, it is necessary to fill them up with coarse gravel with a mixture of loam, working it with water as put in; and if this simple operation is carefully performed over the arches, the trouble and expence of coating with cement, and other substances, may safely be spared.

The water which falls upon the roadway of the bridge, must be conducted beyond the extremity of the wing walls, and be there introduced into covered drains, or open paved sewers, and be afterwards carried off in the most convenient direction.

In or adjacent to towns, walls or quays are usually carried from the abutments along the banks of the river; and even in the country it is frequently found to be advisable for protecting the abutments; but as the description of this sort of work falls more properly under that of wharfs, we shall refer the reader to the articles *HARBOUR* and *INLAND Navigation*.

We have known bridges, whose arches were of considerable size, constructed with bricks. In this case, it is customary either to have the whole of the piers, or at least the upper points cased with stone; but if the points are circular, and bricks made of a suitable shape, and outside bricks laid headers in British cement, the work will be sufficiently substantial. It is necessary that the bricks for the whole bridge be made of good clay, well prepared and tempered, be burnt hard, and laid with thin beds of mortar, but to be properly flushed as they are laid, and grouted afterwards. It is likewise necessary, after the arches are closed, that the centres be suffered to remain until the mortar has acquired a considerable degree of consistence. It will greatly improve the work, if laths or hoop iron are laid in as it advances.

In respect to the formation of arches, although it has been fully treated under the head of *Theory*, yet we cannot help here observing, that the mode adopted by Peronet at Neuilly, has many advantages; for while the main body of the arch has a rise of about one-fourth of

the span, the outside headers, by being a flat segment, gives an appearance of lightness, and in high floods suits the contraction of the vein of water entering the arch.

We have been minute in treating the Practice of bridge building, considering it of importance to the young engineer, to be thoroughly informed of the most improved modes adopted in different countries by experienced persons. He will thus be enabled to judge how far all, or any of them, are applicable to the works he is engaged in; or he may draw from them hints, which may lead him to improve upon all former practice; and, at all events, this will prevent the waste of time in contriving modes already acted upon. We also conceive, that candid foreigners may profit, by being made acquainted with the British manner of conducting the various difficult operations connected with bridge building; for by carefully considering the accounts given by the ablest French engineers, it will be evident, that perhaps one-third part of the materials and labour they have hitherto used, may be saved, and their defects avoided by adopting modes practised in Britain. We freely acknowledge and admire the portion of science which they have bestowed upon those important works. We are greatly indebted to them for so minutely registering each operation, and for so candidly describing their errors and defects. In Britain, we have no such correct journals of similar works published, and very few we suspect preserved. The cause of this, we conceive to originate in the French bridges having been entirely under the direction of its government, who employed men of liberal education, and from whom the officers at the head of their department required regular and minute details of each operation, from the commencement to the completion of every work; and for this purpose, they were no doubt furnished with a sufficient number of superintendants and clerks, who also acted agreeably to forms previously arranged. Whereas in Britain, with a very few exceptions, these useful works have been constructed at the expence, and under the direction of particular, and frequently very limited districts, communities, or individuals, whose chief object has, in general, been economy. For it, they have had recourse to every means that ingenuity could devise, both with regard to the plans and performance. The effect of this has been to create a great competition amongst all persons who have had experience, or any idea of such works. The desire of the competitors to have their proposals accepted, has led them to recur to every project which could reduce the expence; and though from the want of knowledge and desire for economy in those who decided on the merits of the proposals, very frequently inferior plans have been adopted, yet, from the sagacity and good management of the practitioners, we have scarcely ever known, in any work of magnitude, defects similar to those described in the most perfect of the French bridges: indeed, such defects would have rendered the works so inadmissible, that the contractors would have been obliged to take down and reconstruct them.

This mode of competition, joined to the quantity of floating capital always in this country, ready to be applied in any way which promises profit, has, of late years, led to an extreme upon this principle, and rendered caution necessary in selecting, even at an apparent increase of expence, the best qualified of the competitors, of whom we have frequently known upwards of twenty for one project:

WOODEN BRIDGES.

The superstructures of wooden bridges have been constructed in a variety of ways, but their abutments have usually been made of stone. In all, therefore, which regards the foundations and masonry of the abutments, the process is precisely similar to what has been described for stone bridges, only the weight and horizontal thrust of wooden bridges being much less, require a smaller proportion of masonry. Where the streams are narrow, it is only necessary to lay beams across, reaching between the abutments at the distance from each other of four to five feet from middle to middle, and to have braces reaching from some part of the face of the abutments to the lower side of each beam. Besides these supports, the outer beams are usually trussed up by means of the side railing. Across the beams, planking of three or four inches in thickness is laid to receive the gravel. A plank is also fixed along the inside of each railing, to support the side of the roadway. The railing is secured by braces fixed on the outside, or by strong iron knees on the inside.

When the stream is wider than to be reached across by one length of beams, the most usual way has been to drive rows of piles at each length of beams, in lines parallel with the current of the river, at about four or five feet distant from each other, (middle to middle,) and also fixing braces up and down the river to support each pier, or row of piles. These piles are driven and fixed in the same manner as described for the foundations of stone piers. They have usually diagonal braces crossing each side of the row of piles in the form of an X, and which are bolted together at each pile. Tenons are formed on the top of each pile, upon which a cap is morticed; and in order to shorten the bearings, pieces of timber are laid immediately under each beam, extending five to ten feet on each side of the cap. The rest of the structure is completed in the same manner as has been described for one bay of beams. A very perfect model of this sort of bridge was constructed by Mr Peter Nicholson, upon the river Clyde at Glasgow. It is only a foot bridge, but the principle is excellent. See Plate CII.

Instead of driving piles for supports, frames are sometimes constructed on dry land, which are afterwards sunk in their proper situations, after the bottom has been made level to receive them. These upright frames have grated frames attached to their base, and which extend on each side of the upright frames. Through the spaces formed by this excess of breadth, short piles are driven to keep the grating and frames secure. These upright frames have their sides covered with planking; and in order to add to their stability, the lower part is filled with gravel or small stones. Upon the edges of the frames which face the stream, triangular pieces of cast iron are fixed, to prevent ice or other matter floating down the river from injuring the bridge. Fender piles are sometimes driven, so as to form a triangle at some little distance above, and opposite to each pier. This mode has been adopted with perfect success by Mr Telford on the Severn, 8 miles below Shrewsbury. These pilings and frames, in deep and rapid rivers, being not only difficult and expensive in the first instance, but notwithstanding all the precautions which can be taken, liable to injuries not easily remedied, wooden bridges, of great extent, have been constructed from bank to bank, without any intermediate supports. This

has been performed in different ways with great ingenuity. When the banks rise considerably above the level of the river, it is usual to construct the supporting frames chiefly below the level of the roadway.

1. Merely by means of two principal rafters, whose lower ends stand on the abutments, and their points meet below the middle of the beam; or sometimes the upper points pass the outer beams, and meet below the top of the side railing.

2. By the principal rafters reaching from the abutments to an intermediate part of the horizontal beam, and having a stretching piece between their tops. There are instances of this being repeated in the same bridge below the level of the beams, and also again in the side railing of the roadway.

3. By constructing a series of short frames, and placing them vertically in the manner of stone *voissoirs*, and upon these raising the structure of the roadway and railing. This mode was pointed out by Palladio, as suitable for wooden bridges of great extent. Gautier acknowledges that he had adopted Palladio's idea, in forming a design of a wooden bridge for the Seine; and in England, the cast iron bridges at Wearmouth, in the county of Durham, and at Boston, in Lincolnshire, are also formed on this principle.

4. A very ingenious mode has been practised by James Burn of Haddington, in a wooden bridge of 109 feet 3 inches span, and 13 feet 4 inches rise, over the river Don, about 7 miles from the city of Aberdeen, on the road to Banff. Mr Burn takes a series of frames in the form of an arch, but each set of frames is laid horizontally across the soffit. The bridge is 18 feet in width; and there are two rows of frames, or as it were two ribs placed four inches distant from each other. Upon these arch frames, a vertical framing is constructed to support the bearers, the joists, planking, and gravel of the roadway. See Plate LXXXVIII. This bridge was erected in 1803. Mr Burn built another wooden bridge upon the same principles over the same river, at Granholm, within four miles of Aberdeen, to open a communication with the extensive manufactory of James Hadden, Esq. and Co. This bridge consists of two arches, each 71 feet 6 inches span, and 10 feet 6 inches rise: it has only 10 feet 6 inches in width of soffit, and consists of one row of frames. Here there is, of course, a pier in the middle of the river.

The same artist has likewise built, on the same principles, a wooden bridge of three arches over the river South Esk, in the park of William Maule, Esq. at Brechin in Angus-shire. The middle arch is 58 feet span, and 10 feet rise; the bridge is 15 feet in width across the soffit: and there are two rows of frames in each arch, with a space of one foot between them. The piers are of stone, and the spandrels of the arches are covered with boarding, and painted and sanded in imitation of stone, so that the whole has the appearance of three neat stone arches; but the apparent effect of the carpentry by this means is lost.

We know of no wooden bridges in Britain so judiciously constructed as those executed by Mr Burn. Short pieces of timber may be employed. The principal pieces abutting endwise, little change can take place from shrinking. The principle will admit of carrying an arch to a very great extent; and by judicious arrangement, the parts may be taken out and renewed separately.

When it is necessary to keep the roadway low, the trussing is performed chiefly above its level. When the

bridge is narrow, the supporting framing is made entirely on each side, and the roadway suspended between. When it is wider than is advisable to have supported entirely by outside frames, another is introduced on each side of the carriage way, separating it from the footpaths; or there are two carriage ways, with a frame or truss between them.

The following short description, extracted chiefly from a publication by Mr Taylor of Holborn, to whose judicious exertions the British artists are much indebted, with the annexed Plates, will convey a distinct idea of the manner in which the ingenious Ulric Grubenman constructed the celebrated bridge over the Rhine at Schaffhausen, in Switzerland. Fig. 1, Plate LXXXIX., exhibits an elevation of one side, including the roof, which was covered with shingles. Fig. 2 is a cross section at AAA, shewing the uprights which are placed on the pier, the framing under the level of the roadway, the points from whence the braces proceed, the mortices for the beams which support the roadway, and the interior construction of the roof at these uprights. Fig. 3 is also a cross section at B, shewing in what manner the aforesaid roadway beams and the braces pass through the other uprights, how the uprights are connected immediately below the roof, and also how the two pieces of which they are composed are bolted together. Fig. 4 shews the form of the roof at that place. Fig. 5 shews the manner in which the roadway beams, and those along the top of the uprights, are united. And Fig. 6 explains the nature of the points at C and D, by which the several pieces which compose the beam are connected together lengthwise. In Plate XC. Fig. 1. is a longitudinal section including the lower part of the roof, and in which the situations of all the uprights, beams, braces, and iron ties, are distinctly shewn. Fig. 2 is a plan of the floor, with every part of its framing; and Fig. 3 is a similar plan of the roof.

In these Figures every part of the construction is so particularly delineated, as to render its office evident by inspection. The braces proceeding from each abutment, are continued to the beam which passes along the top of the uprights, and the lowest of these general braces are actually united under that beam, thereby forming a continued arch between the abutments, the chord line of which is 364 feet, and the versed sine about 30 feet. These braces are kept in a straight direction by the uprights, which are placed 17 feet 5 inches apart. If this bridge had been formed in a straight line between the abutments, we can see no reason why this form of construction should not have supported a roadway of about 18 feet in breadth, as well as a slight roof; because, in that case, all the weight arising from the braces which proceed from the middle pier would have been saved, and the roof might have been made much simpler and lighter; but the general direction being 8 feet out of a straight line, and being loaded with an unnecessary heavy roof, it was certainly advisable to make use of the braces from the middle pier, and thereby composing two distinct arches.

Although the principles, and even the form of constructing this bridge, might have been drawn from Gautier's publication, or even Palladio's designs for wooden bridges, yet from the account of Ulric Grubenman, being an illiterate man, there is reason to think it was from his own inventive genius that the whole design originated. There is not only a great boldness in the principal members, but also a wonderful attention to all the minutiae of

the edifice; and from even the roofing being overdone in aiming at excellence and security, it is evident this was a first attempt, and that there was an anxiety to avoid the possibility of failure, in what he conceived, and what, as far as regards him, was really a totally new project.

We are informed that John Grubenman constructed a bridge upon the same principles, of 240 feet span, over the Rhine, near Richenau; also that the two brothers erected one 200 feet span over the river Limmat, near Baden. And that the last work of Ulric was a bridge of 230 feet span at Wittingen. In this last, the form of construction was varied: instead of placing the braces diverging from each other, seven beams were built close upon each other, forming a catenarian arch between the abutments, of which the rise was 25 feet. These beams were of oak, in lengths of 12 or 14 feet, breaking joint in the manner of masonry. They were not fastened by pins, bolts, or scarfings; but were kept together by iron straps, placed five feet distant from each other, and fastened by bolts and keys. The roadway intersects them about the middle of their rise.

Over the river Portsmouth, in North America, a Mr Bludget has constructed a wooden bridge 250 feet span, nearly in the same form as the last mentioned of Grubenman; that is to say, each truss or arch consists of three rows of beams placed parallel with, but at some distance from, each other, and each beam consists of two halves, connected by dovetailed keys passing through them horizontally; and similar keys are also passed vertically through all the three beams. This has a more elegant appearance, than where the beams are laid close together; but we doubt if the frame is equally firm.

We have now given a succinct account of the different modes in which wooden bridges have been constructed: from this, the practical mechanic may judge of their comparative merits, and the propriety of their applications in the various situations occurring in practice. Their principles will be discussed under the head of CARPENTRY, as connected with roofing, centres, domes, &c. and we must therefore refer the reader to that article for further information upon this useful and generally interesting subject.

IRON BRIDGES.

In the practice of bridge building, there yet remains to be described a mode not only unknown to the ancients, but unquestionably a late invention of British artists. We are not perfectly certain with whom the proposal first originated, whether it was solely with the Coalbrookdale Company, or whether the late Mr John Wilkinson had some share of the merit; certain it is, he was very active in promoting the first iron bridge.

A thorough discussion of this subject would involve an investigation of the principles of working with iron as a material; but for this we must refer to the article IRON; yet as our readers would naturally be disappointed, if, under the head of Bridge Building, no notice was taken of the modes hitherto practised in this important change of bridge operations; we shall therefore, notwithstanding the length to which we have unavoidably been led to extend the present article, give a short account of the different modes practised in the principal iron bridges which have hitherto been constructed.

The first, as has already been observed, was that erected upon the Severn, a little below Coalbrookdale,

where that river is narrow and rapid. See Plate XCI. The abutments are of stone; they are brought up to about 10 feet above the surface of common low water; here, they have each a platform of squared freestone for ten feet breadth, which serves for a hauling way, and a base for the arch to spring from. Upon this platform, cast iron plates, four inches in thickness, are laid, and formed with sockets to receive the ribs. These plates, in order to save metal, have considerable openings in them. The principal, or inner ribs, which are five in number, and which form the arch, are 9 inches by $6\frac{1}{2}$. The 2d row behind them, and which are cut off at the top by the horizontal bearing pieces, are $6\frac{1}{2}$ by 6 inches; the 3d row are 6 by 6 inches; the upright standards behind the ribs are 15 inches by $6\frac{1}{2}$ inches, but they have an open space in the breadth of $5\frac{1}{2}$; the back standards are 9 inches by $6\frac{1}{2}$, with projections for the braces; the diagonals, and horizontal ties, are 6 inches by 4 inches, and the cast iron tie bolts are $2\frac{1}{2}$ diameter. The covering plates, which are 26 feet in length, reaching quite across the bridge, are one inch in thickness. The great ribs are each cast in two pieces, meeting at the keys, which, as the arch is circular, 100 feet 6 inches span, and 45 feet rise, are about 70 feet in length. There are circular rings of cast iron introduced into the spandrels, and there is a cast iron railing along each side of the roadway of the bridge: the weight of the whole of the iron work is $378\frac{1}{4}$ tons. Behind the iron work, at each extremity of the arch, the abutments are carried up perpendicularly of rubble masonry, faced with squared stone, and the wing walls are also of the same materials.

The iron work was cast and put together in a very masterly manner, under the direction of Abraham Derby, of Coalbrookdale; and the whole was completed in the year 1777. The design was original and very bold, and was, as far as the iron work goes, well executed; but being a first attempt, and placed in a situation where more skill than that of the mere iron master was required, several radical defects are now apparent. The banks of the Severn are here remarkably high and steep, and consist of coal measures, over the points of which vast masses of alluvial earth slide down, being impelled by springs in the upper parts of the banks, and by the rapid stream of the river, which dissolves and washes away the skirts below: The masonry of the abutments and wing walls, not being constructed to withstand this operation, has been torn asunder, and forced out of the perpendicular, more particularly on the western side, where the abutment has been forced forward about 3 or 4 inches, and, by contracting the span, has of course heaved up the iron work of the arch. This has been remedied under the direction of that able mason Mr John Simpson, of Shrewsbury, as far as the nature of the case will admit of, by removing the ground and placing piers and counter arches upon the natural ground behind it. Had the abutments been at first sunk down into the natural undisturbed measures, and constructed of dimensions and form capable of resisting the ground behind, and had the iron work, instead of being formed in ribs nearly semicircular, been made flat segments, pressing against the upper parts of the abutments, the whole edifice would have been much more perfect, and a great proportion of the weight of metal saved. We have already stated, that one row of the principal ribs formed the arch; the two rows behind are carried concentric with the inner row, until intersected by the roadway,

which passes immediately at the level of the top of the inner ribs. This has a mutilated appearance; the circular rings of the spandrels are less perfect, than if the pressure had been upon straight lines; for a circle is not well calculated for resistance, unless equally pressed all round.

We consider it our duty to introduce these observations, in order to shew the necessity for great precaution in similar works, and how liable first attempts are to be defective; but they derogate nothing from the merit of projecting a great arch of cast iron, introducing a material almost incompressible, which is readily moulded into any shape, and which is peculiarly applicable in the British isles, where the mines of iron are inexhaustible, and the means of manufacturing cast iron unrivalled.

The second iron bridge was built upon the same river, about three miles above the former one, at a place called Buildwas. An old stone bridge was carried away by a very high flood early in 1795, and the county of Salop was obliged to restore the communication. (See Plate XCII.) Mr Telford, who was then, and is now, surveyor for the public works of that county, perceiving, that although, in a former repair, the middle pier of the four arches had been taken away, and that space, as well as the two adjacent arches, converted into one arch, yet that the waterway had still been too much confined; and being aware that a few years previous to that time, the extensive low lands in to Montgomeryshire, which formerly acted as a reservoir, had been embanked, so that the flood-waters passed off more hastily, and in a greater body than formerly; in order, therefore, to remove all obstacles out of the way of future floods, and on account of being within two miles of the best foundries in the world, he recommended a cast-iron arch of 130 feet span. (See Plate XCII.) The magistrates of the county agreed to this, and the Coalbrookdale Company became contractors, both for the iron work of the arch, and the masonry of the abutments. Mr Telford, we understand, had some trouble in making that Company depart from their former mode of construction; but he at last prevailed in keeping the roadway low, and adopting the suspending principle, by means of a rib on each side of the bridge, which sprung from a lower base than the bearing ribs, and rose above them to the top of the railing: thus the bearing ribs were supported by the lower parts of those before mentioned, and were suspended by their upper parts. The bearing ribs have a curve of 17 in 130, or nearly one-eighth of their span. The suspending ribs rise 34 feet, or about one-fourth of their span. There are cast-iron braces, and also horizontal ties. There are 46 covering plates, each 18 feet in length, and one inch in thickness. They have flaunches four inches in depth, and are screwed together at each joint; so that, by taking the curvature of the bearing ribs, and being firmly secured at the abutments, instead of a load, they compose a strong arch. There being only one rib in the middle of 18 feet breadth of bridge, on each covering plate, a cross rib or flaunch, four inches in depth, is cast at an equal distance between the bearing ribs. The suspending ribs are each 18 inches in depth, and $2\frac{1}{2}$ inches in thickness, exclusive of a moulding. The bearing ribs are 15 inches in depth, and $2\frac{1}{2}$ inches in thickness, and each of the ribs are cast in three pieces only, of about 50 feet each; the braces are 5 by 3 inches. The principal king posts are $10\frac{1}{2}$ by $4\frac{1}{2}$ inches. The springing plates are each 3 feet broad, and 3 inches thick, with openings to save metal. The uprights against the abut-

ments are $4\frac{1}{2}$ inches square. The strongest uprights in the railing are 3 inches square, and those between them 1 inch. They are placed six inches apart, between middle and middle. The height of the railing above the surface of the roadway, is 4 feet 9 inches. In each spandrel there are 3 circular arches formed with hard burned bricks, which preserve most of the space open, but they are concealed by iron plates, one inch in thickness, which form the outside facings. On the eastern side of the river, although the banks are not so very high or steep, the quality of the ground being similar to that of the other iron bridge, particular care was bestowed upon the abutments: the space for them was excavated down to the rock, which lay considerably under the bed of the river, and the masonry was sunk into the solid part of the rock. It was built up chiefly of square masonry, and the rest of rubble, laid very close in regular courses, and having the back part formed in the shape of a wedge, pointing to the bank. The wing walls were curved horizontally and vertically. At the height of 10 feet above the low water, there is a hauling path on each side of the river. This bridge, which was completed in 1796, has never shewn any appearance of failure in any of its parts; nothing can be more perfect than the iron-work; it is fitted as correctly as a piece of good carpentry.

It has been objected to this structure, that by connecting ribs of different lengths and curvature, they are exposed to different degrees of expansions and contractions. This appears just in theory; and that no discernible effect has hitherto been produced, is probably from the difference being small; but this point will be discussed under the article IRON. Another objection is, an apparent heaviness in the spandrels, from concealing the circular arches with iron plates. For appearance, these spaces had certainly better not been concealed, but they are not liable to the objections made in the former iron bridge, because the space around them is all closely filled up, and the roadway being formed with materials similar to this filling up matter, distributes the pressure very regularly. Upon the whole, considering the strength acquired by placing the covering-plates with their deep flaunches in the form of an arch, we doubt whether a greater degree of strength can be had by any other distribution of the same quantity of cast-iron, viz. 173½ tons: it appears to us, that the upright standards, braces, and king-posts, might be made of smaller dimensions.

We have been informed, that each of these two first iron bridges, including abutments and roadways, cost about 6000*l*.

The third iron bridge was constructed over the river Wear, near Sunderland, in the county of Durham. Its projector was Rowland Burdon, Esq. a gentleman of considerable landed property in that county, and who, for some time represented it in parliament. The iron-work was cast at the foundries of Messrs. Walkers of Rotherham, and erected under the inspection of Mr Thomas Wilson. The confidence in the use of iron, for arches of great extent, was by this time established. The span of the second arch, we have seen, is 30 feet more than that of the first; and, in this third instance, the span is 106 feet beyond that of the second, although its rise is only the same as that of the suspending ribs at Buildwas. The arch at Sunderland springs 60 feet above the level of the surface of low water; the span is 236 feet; the rise, or versed sine, is 34 feet; the width of the roadway 32 feet; and there are six ribs. See Plates XCI. and XCIII.

In this arch, the mode of construction is very different from either of the former. Instead of working with pieces of iron from about 50 to 70 feet in length, each rib is here composed of 125 small frames, each about two feet in the length or curve of the rib, and five deep in the direction of the radius. In each frame there are three pieces of four inches square, which run in the direction of the curve of the arch; and these are connected in the direction of the radius by two other pieces, four by three inches. In each side of the larger pieces, is a groove three inches broad by $\frac{3}{4}$ of an inch in depth; and opposite each cross piece there is a hole in the middle of the groove. When the abutments were brought up, and a scaffolding constructed across the river between them, six of these frames were placed against the abutments in the manner of archstones. Wrought-iron bars, of a length to embrace sundry frames, were then fitted into the grooves. Hollow pipes of cast-iron, four inches in diameter, fitted to reach between each two frames, across the soffit, were introduced. Upon the ends of these pipes are flaunches, in which there are holes, answerable to the holes in the four-inch pieces of the frames, and also to those of the wrought-iron bars. Through these holes, wrought iron bolts were introduced, which brought all the before-mentioned parts together by means of fore-locks. The frames do not meet at the upright pieces, but on the three points of the four-inch pieces only. On the ends of the hollow pipes, there are small projecting pieces, which embrace the upper and lower edges of the frames opposite each joining. These operations were repeated until the whole of the frames were placed, and the arch keyed, forming six ribs between the abutments. Up on the ribs perpendicular pillars are placed; and between them are cast-iron circles, which come in contact with the extrados, the upright pillars, and the bearers of the roadway. The bearers and covering, we suppose for cheapness, are made of timber. The railing is cast-iron. The inclinations each way upon the arch, probably to save weight, are inconveniently steep.

From its great elevation and lightness of construction, this bridge is justly esteemed a bold effort of art, and a magnificent feature in the country. The wooden bridges in Switzerland, and that in America, are of greater span; but, being placed near the surface of the water, and from the difference of material, their parts being of larger dimensions, there can be no comparison as to the fineness of effect. This arch is incontrovertible evidence of what may be accomplished by means of cast-iron, since it answers so well, charged, as it is, with the following, we conceive, material defects:

1. The frames are much too short, thereby multiplying, very unnecessarily, the number of joinings in the main ribs to $125 \times 6 = 750$; and, in the same ratio, increasing the number of braces, ties, and bolts. The pieces of the frames, being of unequal dimensions, is also improper.

2. The preservation of the due position of the frames is made to depend too much upon wrought-iron bars, and bolts, which should be, as much as possible, excluded from structures of this kind.

3. The circles in the spandrels, placed as supports for the roadway, we have already stated, are improper in a situation where they are not equally pressed around.

We shall observe nothing respecting the timber in the superstructure, because this is mere economy; if pro-

perly managed, any bad effects from the difference of expansion and contraction in the two materials, may be easily avoided; and the timber, not interfering with the essential parts, it may, when necessary, be removed, with little interruption to the intercourse over, and none to that under this noble arch. We cannot here resist drawing the attention of our reader to the perfection of this double accommodation, in crossing this deep ravine with facility, while vessels of 200 tons are passing full rigged below.

A cast-iron bridge has lately been built over the river Witham, at Boston, in Lincolnshire, from a design by Mr Rennie. See Plate XCIV. The span is about 85 feet, the rise is about five feet six inches, the breadth is 36 feet, and there are eight ribs; each rib is composed of eleven frames, three feet deep in the direction of the radius. At each joining there is a cast-iron grating across the arch, which connects the frames, on the same principles as ——— practised at Pontcysylte aqueduct. Instead of three pieces in the direction of the curve, as at Sunderland, here there are only two, but they are seven inches by $4\frac{1}{2}$. These are, in each frame, connected in the direction of the radius, by pieces four by three inches. Upon the back of the ribs, pillars, four by three inches, are placed perpendicularly to support the roadway. The superstructure resembles that of the first iron bridge at Coalbrookdale. The arch has been kept very flat, to suit the tide below, and the streets above. The rise being only about $\frac{1}{3}$ of the span, is another proof of the facilities which may be acquired by using cast-iron. The frames being made about four times the length of those at Sunderland, and being connected with cast-iron gratings instead of wrought-iron, are essential improvements; but from the pieces in the frames, which are in the direction of the radius, being only four by three inches, while the main pieces, in the direction of the curve, are 7 by $4\frac{1}{2}$, a great proportion of the former are broken. This is a defect; and the pillars which support the roadway, being perpendicular, do not correspond with the radiated pieces of the frames. The ribs, in springing from the perpendicular face of the masonry of the abutment, have also a crippled appearance.

In improving the port of Bristol, Mr Jessop found it necessary to change the course of the river Avon, and to make two cast-iron bridges over the new channel. See Plate XCIV. The span of the iron-work of each arch is 100 feet; the rise 12 feet 6 inches, or $\frac{1}{3}$ of the span; the breadth is 30 feet; and there are six ribs; each rib is composed of two pieces meeting in the middle, and they are connected crosswise by nine cast-iron ties, which are dovetailed, and wedged into the ribs; the cross sections of these ties are in this form T. The ribs stand upon abutment-plates, which are laid in the direction of the radius. These plates are 32 feet in length, 2 feet 4 inches in breadth, and 4 inches in thickness; in each plate are five apertures, each 5 feet long and 20 inches in width. The ribs are 2 feet 4 inches in depth in the direction of the radius, and two inches in thickness, and have each 80 apertures, one foot square, separated by bars three inches broad, excepting opposite the cross ties, where the solid is 12 inches broad. Where the ribs meet in the middle, they have flaunches eight inches broad and two thick, and they are connected by cast-iron screw-bolts three inches diameter. Between the ribs and the bearers of the roadway, perpendicular pillars, with cross sections of this form T, are

placed. The bearers are of the same form. The whole is covered with cast-iron plates, and there are railings of cast-iron.

There is great simplicity, and much of correct principle in this design: 1. The springing-plates being placed in the direction of the radius, and the abutments receding, to produce a space behind the ribs equal to that between the upright pillars. 2. The ribs being composed of two pieces, and one joint only: and, 3. Wrought-iron being wholly excluded. But we regret still observing the varying dimensions of the parts of the ribs; and that the supporting pillars are still placed perpendicularly; and which, as the arch has more curvature, has still a worse effect than at Boston.

In the course of his employment as engineer to the Board of Parliamentary Commissioners for making Roads and constructing Bridges in the Highlands of Scotland, Mr Telford has lately made a design for a cast iron bridge now constructing upon an arm of the sea which divides the county of Sutherland from that of Ross, at a part where several of these roads unite. In this bridge, the defects noticed in the former works of this sort appear to be avoided. See Plate C. The arch is 150 feet span; it rises 20 feet; it is 16 feet in width, and has four ribs. In the abutments not only are the springing-plates laid in the direction of the radius, but this line is continued up to the roadway. The springing-plates are each 16 feet in length, 3 feet in breadth, and 4 inches in thickness, with sockets and shoulder-pieces to receive the ribs. In each plate are three apertures, three feet in length, and 18 inches in width. Each of the ribs, for the convenience of distant sea-carriage, is composed of five pieces, three feet in depth in the direction of the radius, and two and a half inches in thickness. There are triangular apertures in the ribs, formed by pieces in the direction of the radius, and diagonals between them; but every part is of equal dimensions. At every joining of the pieces of the ribs, a cast-iron grating passes quite across the arch; upon these are joggles or shoulderings to receive the ends of the ribs: the ribs have also flanches, which are fixed to the gratings with cast-iron screw-bolts. Each rib is preserved in a vertical plane, by covering the whole with grated, flanch-plates, properly secured together, and to the top of the ribs, by cast-iron screws and pins. In the spandrels, instead of circles or upright pillars, lozenge, or rather triangular forms are introduced, each cast in one frame, with a joggle at its upper and lower extremities, which pass into the sockets formed on the top of the ribs, and in the bearers of the roadway. Where the lozenges meet in the middle of their height, each has a square notch to receive a cast-iron tie, which passes from each side, and meets in the middle of the breadth of the arch, where they are secured by forelocks. Next to the abutments, in order to suit the inclined face of the masonry, there are half lozenges. By means of these lozenge or triangular forms, the points of pressure are preserved in the direction of the radius. The covering-plates, in order to preserve a sufficient degree of strength, and lessen the weight, are, instead of solid, made of a reticulated shape; the apertures widen below, to leave the matter between them a narrow edge; and contract upwards, so as to prevent the matter of the roadway from falling through. This disposition of the iron work, especially

VOL. IV. PART II.

in the spandrels, also greatly improves the general appearance.

In a printed report of a committee of the House of Commons, of the last session, we find some new information respecting centering for an iron bridge, which, as it promises to form a new æra in bridge-building, we are happy in being enabled to lay it before our readers.

This subject has been brought under discussion in the course of investigating the most effectual mode of improving the mail-roads from Holyhead through North Wales. The island of Anglesea is divided from Caernarvonshire by the celebrated strait or arm of the sea named the Menai, through which the tide flows with great velocity; and, from local circumstances, in a very peculiar manner. This renders the navigation difficult; and it has always been a formidable obstacle in the before-mentioned communication. It has hitherto been crossed by a ferry-boat at Bangor; but the inconvenience and risk attending this mode, has led to speculations of improvement for half a century past; wooden bridges, and embankments, with draw-bridges, have been alternately proposed and abandoned. From a report of the House of Commons, of June 1810, it appears, that Mr Rennie the engineer, had given plans and estimates for bridges at this place in 1802, and had been called on to revise them in 1810. His plans, which appear in the last-mentioned report, are, 1st, One arch of cast-iron, 450 feet span, over the narrowest part of the strait, at a projecting rock named Ynys-y-Moch: and 2d, Another upon the Swilley Rocks, consisting of three cast-iron arches, each 350 feet span. The expence of that at Ynys-y-Moch is estimated at L. 259,140, and of that at the Swilley, L. 290,147. He prefers the latter, because he says, "On account of the great span of the arch at Ynys-y-Moch, and the difficulty and hazard there will be in constructing a centre to span the whole breadth of the channel at low water, without any convenient means of supporting it in the middle, on account of the depth of water and rapidity of the tide, or of getting any assistance from vessels moored in the channel to put it up; I will not say it is impracticable, but I think it too hazardous to be recommended." And again, in the same report: "I should be little inclined to undertake the building a bridge at Ynys-y-Moch."

But from the report of June 1811, it appears, that in May 1810, Mr Telford was instructed by the Lords of the Treasury to survey, and report upon the best method of improving the lines of communication between Holyhead and Shrewsbury, and also between Holyhead and Chester; and to consider, and give plans for passing the Menai. In the aforesaid report (of 1811) we have his plans and estimate. His explanations we shall give in his own words.

"The duty assigned me being to consider, and report respecting a bridge across the Menai, I shall confine myself to this object. Admitting the importance of the communication to justify acting on a large scale, I not only consider the constructing a bridge practicable, but that two situations are remarkably favourable. It is scarcely necessary to observe, that one of these situations is at the Swilley rocks, and the other at Ynys-y-Moch. These two being so evidently the best, the only question that can arise is, to which of them the preference ought to be given.

3 X

"From the appendix to the second report to the Holyhead roads and harbour, it appears, that a considerable number of small coasting-vessels, viz. from 16 to 100 tons, navigate the Menai, and that there have been a few from 100 to 150 tons. By statements from the principal shipbuilders in the river, made in the year 1800, to the Committee for improving the Port of London, it also appears, that vessels of 150 tons, when they have all on end, are only 88 feet in height above the water-line; and further, that even ships of 300 tons, with their top-gallant-masts struck, are nearly the same height: these, in the Menai, are extreme cases, and, if provided for, ought, as to navigation, to satisfy every reasonable person; it may, indeed, rather be a question, whether the height should not be limited to vessels under 100 tons, by which the expense of a bridge would be considerably diminished.

"In the plans I have formed, provision is made for admitting vessels of 150 tons to pass with all on end; that is, in one design preserving 90 feet, and in the other 100 feet between the line of high water and the lower side of the soffit of the arch. The first design is adapted for passing across the three rocks, named the Swilley, Benlass, and Ynys-well-dog; which by their shape and position, are singularly suitable. To embrace the situation most perfectly, I have divided the space into three openings of 260 feet, and two of 100 feet each; making piers each 30 feet in thickness. Over the three large openings, the arches are made of cast iron; over the smaller spaces, in order to add weight and stability to the piers, semicircular arches of stone are introduced; but over these, as well as the larger openings, the spandrels, roadway, and railing, are constructed of cast-iron. In this way the navigation is not impeded, because the piers standing near the outer edges, are guards for preventing vessels striking upon the rocks; while the whole structure presents very little obstruction to the wind. From the extremity of the abutments, after building rubble walls above the level of the tide-way, I propose carrying embankments until the roadway reaches the natural ground. The annexed drawing will sufficiently explain the nature of the design. I propose the bridge to be 32 feet in breadth; and, from minute calculations made from detailed drawings, I find the expense of executing the whole, in a perfect manner, amounts to 158,654*l*.

"The other design is for the narrower strait, called Ynys-y-Moch. Here the situation is particularly favourable for constructing a bridge of one arch; and making that 500 feet span, leaves the navigation as free as at present. In this I have made the height 100 feet in the clear at high-water spring-tides; and I propose this bridge to be 40 feet in breadth. Estimating from drawings, as already described, I find the expense to be L.127,331, or L.31,323 less than the former. From leaving the whole channel unimpeded, it is certainly the most perfect scheme of passing the Menai; and it would, in my opinion, be attended with the least inconvenience and risk in the execution.

"In order to render this evident, I have made a drawing, (see Plate C.) to shew in what manner the centering or frame, for an arch of this magnitude, may be constructed. Hitherto, the centering has been made by placing supports and working from below; but in the case of the Menai, from the nature of the bottom of the channel, the depth at low water, and the great rise and rapidity of the tides, this would be very difficult, if not

impracticable. I therefore propose changing the mode, and working entirely from above, that is to say, instead of supporting, I mean to suspend the centering. By inspecting the drawing, the general principle of this will be readily conceived.

"I propose, in the first place, to build the masonry of the abutments as far as the lines AB, CD, and in the particular manner shewn in the section. Having carried up the masonry to the level of the roadway, I propose upon the top of the abutments to construct as many frames as there are to be ribs in the centre; and of at least an equal breadth with the top of each rib. These frames to be about 50 feet high above the top of the masonry, and to be rendered perfectly firm and secure. That this can be done, is so evident, I avoid entering into details respecting the mode. These frames are for the purpose of receiving strong blocks or rollers and chains, and to be acted upon by windlasses or other powers.

"I next proceed to construct the centre itself: it is proposed to be made of deal bulk, and to consist of four separate ribs; each rib being a continuation of timber frames five feet in width at the top and bottom, varying in depth from 25 feet near the abutments to 7 feet 6 inches at the middle or crown. Next to the face of the abutments, one set of frames, about 50 in length, can, by means of temporary scaffolding, and iron chain bars from the before-mentioned frames, be readily constructed, and fixed upon the offsets of the abutments, and to horizontal iron ties laid in the masonry for this purpose. A set of these frames, (four in number,) having been fixed against the face of each abutment, they are to be secured together by cross and diagonal braces, and there being only spaces of 6 feet 8 inches left between the ribs, (of which these frames are the commencement,) they are to be covered with planking, and the whole converted into a platform 50 feet by 40. By the nature of the framing, and being secured by horizontal and suspending bars, I presume every person accustomed to practical operations will admit, that these platforms may be rendered perfectly firm and secure.

"The second portion of the centre frames, having been previously prepared and fitted in the carpenter's yard, are brought, in separate pieces, through passages purposely left in the masonry, to the before-mentioned platforms. They are here put together, and each frame raised by the suspending bars and other means, so that the end which is to be joined to the frame already fixed, shall rest upon a small moveable carriage. It is then to be pushed forward, perhaps upon an iron rail road, until the strong iron forks, which are fixed on its edge, shall fall upon a round iron bar, which forms the outer edge of the first, or abutment frames. When this has been done, strong iron bolts are put through eyes in the forks, and the aforesaid second portion of the framework is suffered to descend to its intended position, by means of the suspending chain bars, until it closes with the end of the previously fixed frame, like a rule joint. Admitting the first frames were firmly fixed, and that the hinge part of this joint is sufficiently strong, and the joint itself 20 feet deep, I conceive, that even without the aid of the suspending bars, that this second portion of the centering would be supported; but we will, for a moment, suppose, that it is to be wholly suspended. It is known, by experiment, that a bar of good malleable iron, one inch square, will suspend 80,000*lbs*. and that the powers of suspension are as the sections; conse-

quently, a bar $1\frac{1}{2}$ inches square, will suspend 180,000lbs.; but the whole weight of this portion of the rib, including the weight of the suspending bar, is only about 30,000lbs. or one-sixth of the weight that might safely be suspended; and as I propose two suspending chain-bars to each portion of rib, if they had the whole to support, they would only be exerting about one-twelfth of their power; and considering the proportion of the weight which rests upon the abutments, they are equal also to support all the iron work of the bridge, and be still far within their power.

"Having thus provided for the second portion of the centering, a degree of security far beyond what can be required, similar operations are carried on from each abutment until the parts are joined in the middle, and form a complete centering; and being then braced together, and covered with planking where necessary, the whole becomes one general platform, or wooden bridge, to receive the iron work.

"It is, I presume, needless to observe, that upon such a centering or platform, the iron work, which, it is understood, has been previously fitted, can be put together with the utmost correctness and facility; the communication from the shores to the centre will be through the before-mentioned passages in the masonry. The form of the iron work of the main ribs will be seen, by the drawing, to compose a system of triangles, preserving the principal point of bearing in the direction of the radius. It is proposed in the breadth of the bridge (i. e. 40 feet) to have nine ribs, each cast in 23 pieces, and these connected by a cross grated plate, nearly in the same manner as in the great aqueduct of Pontcysylte, over the valley of the Dee, near Llangollen. The fixation of the several ribs in a vertical plane, appearing (after the abutments) to be the most important object in iron bridges, I propose to accomplish this by covering the several parts or ribs, as they are progressively fixed, with grated or reticulated and flanchied plates across the top of the ribs. This would keep the tops of the ribs immovable, and convert the whole breadth of the bridge into one frame. Besides thus securing the top, I propose also having cross braces near the bottom of the ribs.

"The ribs being thus fixed, covered, and connected together, the great feature of the bridge is completed. And as, from accurate experiments made and communicated to me by my friend, the late William Reynolds of Coalbrookdale, it requires 448,000lbs. to crush a cube of one quarter of an inch of cast-iron, of the quality named gun-metal, it is clear, while the ribs are kept in their true position, that the strength provided is more than ample.

"When advanced thus far, I propose, though not to remove, yet to ease the timber centering, by having the feet of the centering ribs (which are supported by offsets in the masonry of the front of the abutment,) placed upon proper wedges; the rest of the centering to be eased at the same time by means of the chain bars. Thus the hitherto dangerous operation of striking the centering, will be rendered gradual and perfectly safe; inasmuch that this new mode of suspending centering, instead of supporting it from below, may perhaps hereafter be adopted as an improvement. Although the span of the arch is unusually great, yet by using iron as a material, the weight upon the centre, when compared with large stone arches, is very small. Taking the mere ring of archstones in the centre arch of Black-

friars bridge, at $156 \times 43 \times 5$, equal to 33,450 cubic feet of stone, it amounts to 2,236 tons; whereas the whole of the iron work, in the main ribs, cross plates, and ties, and grated covering plates, that is to say, all that is lying on the centering at the time it is to be eased, weighs only 1791 tons. It is true, that from the flatness of the iron arch, if left unguarded, a great proportion of this weight would rest upon the centering; but this is counterbalanced by the operation of the iron ties in the abutments, and wholly commanded by the suspending chain bars.

"When the main ribs have been completed, the next step is to proceed with the iron supporters of the roadway; and these, instead of being constructed in the form of circles, or that of perpendicular pillars, as hitherto, are here a series of triangles, thus including the true line of bearing. These triangles are, of course, preserved in a vertical plane by cross ties and braces. Iron bearers are supported by these triangles, and upon the bearers are laid the covering plates under the roadway, which, instead of being solid, are, (in order to lessen the weight,) proposed to be reticulated.

"If I have, throughout this very succinct description, made myself understood, it will, I think, be admitted, that the constructing a single arch across the Menai, is not only a very practicable, but a very simple operation; and that it is rendered so, chiefly by adopting the mode of working from each abutment, without at all interfering with the tideway.

"In the case of the Swilley bridge, although the arches are smaller, yet being placed on piers, situated on rocks, surrounded by a rapid tide, the inconvenience of carrying materials, and working, is greatly increased; and supposing the bridge part constructed, an enormous expence has still to be incurred before the roadway can be carried over the flat ground on the Anglesea shore. Therefore, whether economy, facility of performance, magnificence, or durability be consulted, the bridge of one arch is, in my opinion, infinitely preferable; and it is no less so, if considered in what regards the navigation."

This mode of constructing centres, applicable to stone as well as iron arches, being an original idea, and perfectly simple, and the effects of all its operations being more capable of correct demonstration than those of the former mode of supporting from below, we were glad of being enabled, while this article was in the press, to communicate the outlines of the scheme, as given by the engineer in his report to the lords of the treasury. If this should be successfully practised on so large a scale at the Menai, all difficulties with regard to carrying bridges over inaccessible ravines or turbulent streams, will, in future, be done away, and a new æra formed in bridge building.

We have only given a Plate of the centering, because the construction of the iron work is precisely the same in principle (though on a larger scale) as what has been adopted by the same engineer in Bonar bridge. See Plate C.

We have now given our readers a distinct view of the progress of the practice of constructing bridges with cast iron, as far as it has hitherto been carried. We are well convinced that much more will still be accomplished; and when we come, under the article *IRON*, to treat generally of its qualities and different modes of application, some light will be thrown upon the sub-

ject, which we expect will tend still further to enhance its importance in the great practical purposes of life.

Although it is trusted the reader will, in this article, have found bridge building as fully discussed as he could expect in a work of this nature, yet if disposed to prosecute the subject more at length, he will be enabled to do so by consulting the following able authors, who have written on the subject either generally, or in describing particular works.

It is rather surprising, that although the Romans had, before the time of Vitruvius, introduced the use of the arch, not only in bridges and aqueducts, but in theatres and temples, yet he has not been led to discuss, or even particularly to notice this principal feature in Roman architecture.

Leoni Baptisti Alberti first wrote upon bridges in 1481. Palladio followed about a century afterwards. Serlio and Scamozzi also treated the subject, and the latter gives useful rules respecting foundations. See also Ferrari on Arches, in the *Act. Sienn.* vi. 143.

Blondel has described the bridge which he built in 1665, in the tideway upon the Charante at Xaintes. Gautier, in 1714, published a treatise expressly upon bridge building, systematically arranged, and containing much useful practical information. Perronet, in 1768, published an elaborate work, containing very minute details of the progress in building some of the principal bridges in France, and also valuable information respecting materials, foundations, centres, arches, scaffolding, and machinery. Regemotte gives an account of a bridge of 13 large arches, built by him on the Allier at Moulins. Cessart, in his *Travaux Hydrauliques*, gives an account of the bridge of Saumur of 12 large arches, upon the Loire. Belidor, in the 4th vol. of his *Archit. Hydraul.*, treats of bridges. Parent, De la Hire, and Bossut, treat the subject scientifically. See also Abeille *Mem. Acad. Par.* i. 159. Sebastien, *Do.* i. 163.

De la Hire, *Do.* 1702, 1712. Senes, *Do.* 1719, 363. Couplet, *Do.* 1729, 1730. Chardon, *Do.* 1731. Bouguer, *Do.* 1734. Bossut, *Do.* 1774, 534; 1776, 587. Coulomb, *Mem. des Savans Etrangers*, 1773, 343. Giral, *Sur les constructions des ponts*, 4to. Trembley in Rozier's *Observations*, tom. xxxiii. p. 132. Montpetit in Rozier's *Observ.* tom. xxxii. p. 430.

Epinus wrote on the abutments of arches in the *Mem. Acad. Berl.* 1755, p. 386.; and Euler on the method of judging of the strength of a bridge from a model in the *Nov. Comment. Petrop.* tom. xx. p. 271. See also Lorgna on the Curve of an Arch, in the *Acta Petrop.* III. ii. 156.

Labelye published a short report respecting Westminster bridge. Goldman and Hawksmoor also treated on the subject of bridges. Semple published a detailed account of the mode of conducting the building of Essex bridge in Dublin. He also treats of building in water. Dr Hook, Emerson, and Muller, have discussed the principles of arches scientifically. Dr Hutton, in a separate treatise, and also in his Dictionary, treats of the principles of bridges; and his valuable works contain many useful remarks and directions respecting those edifices. The late Mr Atwood published an essay upon the principles of arches, in two parts, in which much science and originality of mind are displayed. See likewise Robinson in the *Phil. Trans.* 1684, vol. xiv. p. 583. Robertson on the fall of water under bridges, in the *Phil. Trans.* 1758, p. 492.; and Dr Thomas Young's *Natural Philosophy*, vol. ii. p. 175, &c. (v)

✧ The construction of Timber and Chain Bridges in America, has been carried to such an extent of skill and utility, that an important addition to the preceding article ought to find a place here. But the necessity of proceeding regularly with our publication, forbids the delay which would be occasioned by waiting for a completion of the paper on this subject, which is now in preparation for this work. It will be found under the article SPAN.—Editors.

BRIDGEND, a town of South Wales, in the county of Glamorgan, situated on both sides of the river Ogmore, over which there is a good stone bridge. The town, which consists of a street on each side of the river, is tolerably well built, and is divided into three parts, called New Castle, Old Castle, and Bridgend, the two first deriving their names from two castles, the remains of which are still visible. The town-hall is a neat building, the market-place is very commodious, and the parish church is well built, and commands a fine prospect. The soil of the adjacent country is fertile, and in a state of good cultivation; and great quantities of salmon, sewin, trout, and flat fish, are caught in the river. The chief trades carried on in the town are tanning and tallow chandlery, and a large woollen manufactory has been established by the agricultural society of the county. Woollen cloths and blankets are manufactured by means of machinery, and sent to Witney, where they are sold as manufactured in that place. There are here two annual fairs, and a good weekly market on Saturday. Some accounts state the population of this town at 7140, and the number of houses at 1688; while others make the population only 1701, the number of houses 386, and the number of persons engaged in trade

at 200. The last statement we suppose to be the most correct. See Malkin's *Tour in South Wales* in 1804. (π)

BRIDGENORTH, a borough and market town in England, is romantically situated upon the river Severn, in the county of Salop, and hundred of Stoddesdon, 22 miles south-east from Shrewsbury, and 140 north-west from London. The river divides it into the upper and lower town, which are united by an old inconvenient bridge of seven arches, which having been frequently injured by the floods, is now rebuilding, from a fund accumulated by a toll collected under an act of parliament obtained several years ago. The upper town stands upon the top and sides of a hill composed of red sandstone. It consists chiefly of two streets, which are wide, well paved, and would be very commodious if the town hall (which occupies the middle of the high street) was removed. From these principal streets, several others, that are narrow and steep, branch off, and pass down to the river. The entrance from the south was formerly by one of these, but being intolerably inconvenient and dangerous, a new and more commodious entrance has been formed round the south-western base of the castle hill. The expence of this was defrayed by a toll. Many of the communications down the face of

the bank next the river, are by means of successive flights of steps. A great number of houses are excavated entirely out of the sandstone rock, so that it is not uncommon to see the smoke rising in the middle of little hanging gardens, where nothing but the stalk of a chimney appears. The town walls, of which the northern gate only remains, was built by Roger de Belesme, earl of Shrewsbury, who also fortified this place with a strong castle, and here, with a few desperate associates, made a stand against the forces of his sovereign Henry I., but was soon compelled to relinquish it and fly to Normandy. This castle is now almost entirely demolished. One of the square towers, however, which is still standing, is an object of great curiosity, having been partly undermined during the civil wars between the king and the parliament: it now leans out of a perpendicular 21 feet in the height of 70 feet. Within the precincts of the castle, upon the scite of an old chapel dedicated to St Mary Magdalene, a magnificent new church has lately been erected, from a design and under the direction of Mr Telford. It was finished in 1796. The length is 121 feet, breadth 77; height of the tower 114 feet; the height of the Tuscan order which surrounds the whole church is 36 feet 6 inches. Internally, sixteen Ionic columns reaching to the ceiling, divide and support the body or cell. Neither externally nor internally is there a single ornament, excepting the essential parts of these orders. Near the north end of the town, in the highest part of the hill, stands the church of St Leonard, an old imperfect edifice. On the west side of the river are the remains of an ancient and magnificent convent, under which there are several remarkable vaults running to a great length. There is here a free school for the sons of the burgesses, which also sends and maintains eighteen scholars at the university of Oxford. Bridgenorth is governed by two bailiffs, annually elected out of 24 aldermen, who must have gone through all the offices of the borough, 48 common council men, a town clerk, and recorder. It returns two members to parliament, which privilege was granted by Edward I., and is vested in the corporation and freemen, amounting nearly to 1700. The manufactures carried on here are building barges, which navigate the Severn; tanning leather; making carpets, which has been carried to a very considerable length by Messrs Macmichaels; as also a cast iron foundery, established in the same town by Messrs Allen and Hasledine. Cloth, stockings, and some ironmongery goods, are also made here. The trade is considerable, being a market for a great extent of rich country, and carrying on, by means of its barges, a considerable intercourse with the other towns upon the river Severn. The market is on Saturday; and its fairs, which are on Thursday before Shrovetide, March 14, May 1, June 30, Aug. 2. and October 29, are resorted to from most parts of the kingdom for cattle, sheep, butter, cheese, bacon, and hops. The last, which continues three days, is a very considerable mart for horses, especially two-year old colts of the draught kind, and for weanling calves. This town consists of two parishes, St Leonards and St Mary Magdalene, containing in 1801, 910 houses, and 4319 inhabitants, of whom 3800 are employed in trade and manufactures.

The inhabitants are well supplied with water from a spring about half a mile from the town, whence it is conveyed by means of pipes. Water is also raised from the river by a water wheel, up to a reservoir on

the edge of the castlehill. Near this reservoir a walk is made round the castle, which forms one of the finest terraces in England. The views from it, particularly up the river to the bold and richly wooded banks at Apley, are not to be surpassed. It is situated in W. Long 2° 30', N. Lat. 52° 38'. See Buck's *Antiq.* and Plymley's *Survey of Shropshire.* (L)

BRIDGETOWN, the capital of Barbadoes, lies in the south-west part of the island, in the parish of St Michael, and in the innermost part of Carlisle Bay. Its situation was originally chosen entirely on account of its convenience for trade, without any regard to the health of its inhabitants. It is surrounded with low flat grounds, which being often overflowed by the spring tides, rendered it very insalubrious; but which being now drained, it is reckoned as healthy as any place in the island. This town was formerly the most elegant and largest in all the Caribbee islands, but it has suffered greatly, both from fire and hurricanes. (See BARBADOES, vol. iii. p. 254.) It is, however, again recovering its former appearance, and affords most of the conveniences, either for entertainment or amusement, which are to be found in any city of Europe. The streets are broad, the houses lofty and well built, and many of them rent as high as those in London. The church of St Michael is a large and beautiful building, exceeding many of our English cathedrals. It has a curious clock, an excellent organ, and a peal of bells. Bridgetown has also a hospital and a college, founded and liberally endowed by Col. Codrington, for maintaining professors and scholars to teach and study divinity, surgery, and physic. It is the only institution of the kind in the West Indies; but its success has not answered the designs of its founder. About a mile from the town stands the governor's country seat, called *Pilgrims*, which is a handsome villa built by the assembly. This town enjoys perfect security against foreign invasion, from the strength of its forts, and the boldness of the coast. It is defended on the west by St James' fort, mounting 18 guns; Willoughby's fort, which is built upon a tongue of land running into the sea, and mounts 12 guns; Needham fort, mounting 20 guns; and St Ann's fort, which is the strongest in the island, and stands near within land. On the east it has steep cliffs, high rocks, and foul ground. Carlisle Bay is formed by Needham and Pelican points, and is capable of containing 500 vessels, being about 4 miles long, and 3 broad, but the bottom is foul and injurious to cables. The harbour is one of the best in the West Indies, and is completely secured from the northeast wind, which is the constant trade-wind in Barbadoes. The wharfs are large and commodious for loading and unloading goods; and monthly packet boats have lately been established here for carrying letters to and from Great Britain. Bridgetown is the seat of the governor, council, assembly, and court of chancery; and its militia, with that of the parish of St Michael, amount to 1200 men, who are called the royal regiment of foot guards. North Lat. 13° 9' 30", West Long. 60° 2' 30". (L)

BRIDGEWATER, a borough and market town in England, in the hundred of North Petherton, and county of Somerset, is situated in a flat and rather woody country, on the river Parrot, 12 miles from the sea, and nearly 128 west from London. Over the Parrot is a stone bridge, which connects Bridgewater with the suburb of Eastover; and also an iron bridge lately erected.

The streets are very irregular, but wide and well built; and the church of St Mary is a large and handsome building, with one of the largest spires in the kingdom. It has a spacious town-hall, and a high cross, with a cistern over it, to which water is conveyed by an engine from a neighbouring rivulet, and thence carried to the different streets. It has also several meeting-houses for Presbyterians, Baptists, and Quakers; and, it is worthy of notice, that in one of these there is a pew appropriated for the mayor and aldermen, should they happen to be of that persuasion. Bridgewater was formerly the private estate of William de Brewere, but was erected into a free borough by King John, and afterwards made a mayor-town by Henry IV. Its corporation consists of a mayor, a recorder, two aldermen, 24 common-council men, and a town clerk; and it sends two members to parliament, who are chosen by the inhabitant householders, who pay *scot and lot*. The authority of the magistrates extends throughout the parish; and the recorder, with the mayor and aldermen, are empowered to hold four sessions annually, for trying all crimes and misdemeanors, not capital, committed within their jurisdiction. A court of record is also held every Monday, for the cognizance of all debts. The midsummer county sessions are held at Bridgewater, and the assizes every other year. As this town was made a distinct county by Henry VIII. the sheriff of Somerset cannot send any process into the borough; and its burgesses are free in every town of England and Ireland, except London and Dublin. The revenue is valued at 5000*l.* per annum; and the corporation are conservators of the navigation of the river Parrot, which is navigable at Bridgewater for vessels of 200 tons, and for large barges as far as Taunton and Langport. Bridgewater has very little foreign trade, but a great deal of coasting. A large and commodious quay receives the manufactures of Manchester, Liverpool, Birmingham, &c. which are conveyed by waggons to the internal parts of Devon and Cornwall; and about forty vessels from 30 to 100 tons are employed at this port for bringing coals from Wales; by which means, the neighbourhood are supplied with this article at a moderate rate. The duties paid on imports amount to about 2500*l.* a year; and the duty on coal alone, for seven years, was estimated at 16,000*l.* or 17,000*l.* Its fairs, of which there are four in the year, are well supplied with cattle, horses, and sheep; and also with cloths and linen. Its markets are on Thursday and Saturday. The tide rises here six fathoms at high water, and sometimes flows with such impetuosity, that it rises at once nearly two fathoms. This sudden flow, from its impetuosity and noise, is called the *boar*. It is frequent in all the rivers of the Channel, particularly in the Severn, and often occasions considerable damage to the shipping, by driving them foul of each other, and upsetting the small craft. Bridgewater was formerly a place of much greater importance than it is at present. It was regularly fortified during the civil wars, and protected by a castle, but since that time it has suffered greatly from conflagrations, and the various vicissitudes of war. In 1645, it was besieged by the parliament army under Sir Thomas Fairfax, who committed great devastations; and it was here that the duke of Monmouth encamped his undisciplined army previous to his defeat on Sedgemoor. Population, 3634; of whom 986 are engaged in trade and manufactures. W. Long. 2° 59', N. Lat. 51° 7'. (h)

BRIDLE, an essential part of the trappings of a

horse, for controuling its head, and regulating its motions.

The bridle first known was certainly nothing more than a simple thong, or cord fastened about the head or neck of the horse, like our common halter: all the parts which now compose it have been adopted at different periods. In some countries it is still very little more than a thong; for the laziest and most unwieldy of quadrupeds, the elephant, is guided by nothing but a cord around the neck, while his rider impels him forward by a goad. Buffaloes also, and oxen trained to labour, are, in some of the warmer countries, bridled by a cord passing through the cartilage of the nose.

Though the ancients guided their horses by reins, it has been questioned by Fabretti, Montfaucon, and others, whether they were acquainted with the curb, and particularly the bit presently in use; and, trusting to sculptures where the equestrian is represented in the act of leading his horse, certainly nothing like a bit appears. But it has been contended, on the other hand, that the *frana lupatá* spoken of in the classics consisted of a bit with jagged teeth. The bit, however, is not to be considered a modern invention, though there are several countries where it is yet unknown.

The bridle at present consists of the reins, bit, and curb, to which chains are sometimes added; and all these are supposed to have properties according to the various form and dimensions of which they are constructed. Of late the reins of riding, and some carriage-horses, were made of leather rounded into the form of a cord, by which equal strength, and greater convenience, are preserved. The bit, which, combined with the reins, is so efficacious in controlling a horse, is flexible or inflexible, jointed, curved, or provided with rollers, and its side-pieces are long, short, bent, or straight at pleasure, and according to the restraint they are to produce; and are called the *Hessian*, *Pelham*, or *Weymouth* bits. The curb consists of a chain composed of links, which, it has been attempted to demonstrate, should be long. In treating of this subject, a modern author thus expresses his opinion: "If any panacea or universal medicine is known, the snaffle is one for the mouth of horses; it suits and accommodates itself to all; either finding them good, or speedily making them so. The mouth once made, will always be faithful to the hand, act with what agent it will. This bridle can at once subject the horse to great restraints, or indulge him in ease and freedom. It can place the head exactly as the horseman chuses to have it; and can work and bend the neck and shoulders to what degree he may find expedient."

In European countries, the bridle is generally plain, and of a strength and weight proportioned to the service to be performed, and the nature of the animal on which it is employed. But among the eastern nations it is often richly ornamented, and is sometimes studded with the most precious jewels.

In considering all that has been said on the various properties of reins, curbs, and bits of different fashions, it appears that so much attention bestowed on bridles might be avoided by a judicious mode of training horses. Every animal, almost without exception, may be rendered docile by mild and suitable treatment. Were horses, from the earliest period, constantly familiarized with mankind, their tractability, instead of being the result of cruel and coercive measures, would increase as they became fit for use. The necessity, therefore, for the

reins, bits, and curbs, which are chiefly adapted to the unsubdued animal, would daily diminish. It cannot be overlooked, that the Tartars, who constitute the first equestrians in the world as a nation, guide and restrain their horses more by the motion of the knees than the influence of the bridle; and it is a leading characteristic of all Orientals to ride with a slack rein. See HORSEMANSHIP. (c)

BRIDLINGTON, a market and seaport town in the East Riding of Yorkshire. The town is situated about a mile and a quarter from the harbour, which is called Bridlington-quay. This harbour, which has lately been much improved, is very safe and commodious, and is protected from the north-west and north-east winds by two strong piers, which run out obliquely into the sea, and form an agreeable promenade. Several good trading vessels belong to the port; and the inhabitants are principally seamen and fishermen. The town itself is small and neat, but irregularly built, and the houses are in general old. The church was once a noble building; but the two towers at the west end are destroyed, the nave only being left for divine service. The mineral waters of this place are held in great estimation; and, within these few years in particular, it has become a place of resort for sea-bathing. Horned cattle, toys, linen and woollen cloths, are the articles disposed of at the fair of this town. Number of houses, 687. Population, 3130; of whom 1031 were returned as employed in trade and manufactures. See *The Guide to the Watering-places*, 1806. (w)

BRIDPORT, a borough and market town in Dorsetshire, is situated in a vale surrounded by hills, between two branches of the river Brit, about one mile north from Bridport Bay, and 135 south-west from London. This town has a very respectable appearance, and consists of three spacious streets, having many substantial houses, both of brick and stone. A handsome market-house stands in the centre, and near it the church of St Mary, which is a large ancient building, in the form of a cross, adorned with pinnacles and battlements, and a tower in the middle 72 feet high. It had once a priory, which stood near the bridge, and several religious foundations; but no traces of them are now to be seen. It has, however, a charity-school and three alms-houses. Bridport is a great thoroughfare to the west of England, and its inhabitants are chiefly employed in the manufacture of small cordage, nets, and sailcloth; the greater part of which is consumed in the British and Newfoundland fisheries; and it has been computed, that nearly 1500 tons of hemp and flax are here annually converted into these articles. Indeed this manufacture was formerly so flourishing, that it was enacted, in the reign of Henry VIII, that all the cordage used in the English navy should be made at, or within five miles of Bridport; and this act continued in force for nearly 60 years. Its harbour, which is situated very conveniently for trade, at the mouth of the river Brit, about a mile south from the town, has long been choked up with sand; but of late has been so far recovered as to admit a few vessels not exceeding 200 tons burthen. It does not appear, however, that this town was ever of any consequence in maritime affairs; and though many attempts have been made to make it a port, yet they have all proved ineffectual. Many excellent vessels are built at Bridport, particularly smacks, with which most of the trading companies in Scotland are supplied. It has two market days, Wednesday and Saturday, and three

annual fairs. It returns two members to parliament; and contains 287 houses, and 3117 inhabitants, of whom 3006 are employed in trade and manufactures. N. Lat. 50° 41' 13", W. Long. 2° 50' 59". (L)

BRIEG, the **BREGA** of the ancients, a city of Silesia, and capital of the principality of the same name, is situated on the left bank of the Oder, over which there is a good bridge. After the capture of this city by the king of Prussia, in 1741, this monarch repaired the damage which it sustained in the siege, increased the fortifications, and built a new suburb. The houses are, in general, well built, and the principal public edifices are, the Lutheran College, an Academy where the nobles learn different exercises, the arsenal, and several Roman Catholic and Protestant churches. There is here a manufacture of fine cloth, and a great deal of spinning has been carried on both in the town and neighbourhood, since the year 1728, when Brieg obtained permission from the emperor to hold two fairs annually for the sale of wool. A considerable trade in the wines of Austria and Hungary is carried on by the merchants of this place. To the north of the town, in a spacious meadow intersected by a broad dike, paved with stones, there are held three fairs every year, where many thousands of cattle from Poland and Hungary are brought for sale. In the neighbourhood of Brieg there are several iron founderies. Corn, madder, and tobacco, are produced in the principality, which is about 36 miles long, and from 8 to 21 broad. East Long. 17° 38', North Lat. 50° 48'. (w)

BRIEL, or **BRILL**, a maritime city of the United Provinces, and capital of the island of Voorn, is situated near the embouchure of the Meuse, with which it communicates by means of a large and commodious harbour. It holds the fifth rank among the cities of Holland, and is famous for being the place where the confederates of the United Provinces first established their independence. Being driven from the Low Countries by the duke of Alva, and on account of the representations of the Spanish ambassador to queen Elizabeth, denied admission into England, these desperate exiles were forced to attempt the most perilous enterprises. Sailing towards Enckhuysen, in 1572, they were driven by unfavourable winds to the island of Voorn, when they assaulted and took the city of Briel, which they fortified, and made the first asylum of their liberty. The inhabitants of the surrounding country immediately flocked to their standard, and in a few days, the provinces of Holland and Zealand had revolted from the Spaniards. When the states of Holland concluded a treaty with queen Elizabeth in 1585, Briel was one of the cautionary towns delivered to the English for securing the fulfilment of their engagements; and it continued to be garrisoned by English troops until 1616, when it was restored to the states. This city is also noted for being the birth place of the celebrated Martin Harpertz Tromp, admiral of Holland, who was killed in an engagement with the English fleet under admiral Blake, off the Texel, on the 8th of August, 1653. It is $5\frac{1}{2}$ leagues from Rotterdam, and $4\frac{1}{2}$ from Delft. N. Lat. 51° 53', E. Long. 4°. (h)

BRIGGS, HENRY, a celebrated mathematician, was born in 1556, at Warley wood, near Halifax, in the West-riding of Yorkshire. At the age of 23 he left the grammar school, and went to St John's College, Cambridge. In 1581 he took his degree of Bachelor of Arts, and three years afterwards, that of Master; and in 1588 he

was chosen a Fellow of that College. His passion for mathematical learning had already displayed itself in the progress of his studies, and such was the fame which he had acquired in this department, that in 1592 he was appointed examiner and lecturer in the mathematics; and he was soon after chosen reader of the physic lectures, founded by Dr Linacre. Upon the establishment of Gresham College in London, Briggs was, in 1596, elected the first Professor of Geometry; and in this new situation he drew up a table for determining the latitude of the place from the variation of the magnet. This table was published by Dr Gilbert, in his book *De Magnete*, and also by Thomas Blundeville, in his *Theoriques of the Seven Planets*, a work which appeared in London in 1602. In the year 1609, he became acquainted with Mr James Usher, afterwards archbishop of Armagh, with whom he carried on a correspondence for many years, and two of these letters are to be found in the published collection of Usher's letters.*

About this time, in 1614, our countryman lord Napier, published his *Mirifici Logarithmorum canonis descriptio*, containing an account of the discovery of logarithms. This work attracted the particular notice of Briggs, who appears to have perceived at an early period, the advantages of that change in the system of Napier, which was afterwards adopted. In the system invented by Napier, the logarithms of a series of numbers, increasing in the decuple ratio of 1, 10, 100, formed a decreasing arithmetical series, in which the common difference of the terms was 2.3205851. Briggs, however, considered, that it would be more conformable to the decimal notation to adopt a system in which 1 should be the logarithm of the ratio of 10 to 1. This alteration in the scale of logarithms, was explained by Briggs in his lectures at Gresham College; and he also communicated it by letter to lord Napier. Not satisfied with an epistolary correspondence, Briggs went to Scotland in 1616, for the express purpose of explaining to Napier the plan which he had formed. During their conversations on this subject, Napier observed, that the same plan had formerly occurred to him after he had calculated the logarithms according to his own system, and that he merely gave these to the world till his health and leisure should permit him to accommodate them to the new system. It was proposed by Briggs to make the logarithms of the sines increase from 0, the logarithm of radius to infinity, while the sines themselves should decrease; but Napier observes that it would be preferable to make them increase, so that 0 should be the logarithm of 1, and that 100000 should be the logarithm of radius. This suggestion met with the approbation of Briggs,

who accommodated to it the numbers which he had already calculated; and in 1617 he repeated his visit to Scotland to submit them to the consideration of his friend.† On his return to England in 1617, Briggs printed his *Logarithmorum Chilias prima*, though he does not seem to have published it till after the death of Napier, which took place in 1618, as he expresses a hope that the causes which led to the change of the logarithmic system would be explained in the posthumous work of lord Napier. It would appear, however, that the Scotch mathematician preserved such a studied silence on the subject, as to create a suspicion that he wished himself to be considered as the sole author of the new system. Briggs was entitled to regard the conduct of his friend as injurious to his reputation, and he accordingly asserted his claims to the improvement of Napier's system in the preface to his *Arithmetica Logarithmica*, &c.

In the year 1619, Briggs was appointed the first Savilian professor of geometry at Oxford; and in 1620 he resigned his office in Gresham College, and removed to Oxford, where he spent the remainder of his life. In consequence of being a member of the company trading to Virginia, he published in 1622, a *Treatise on the North West passage to the South Sea, &c.* which was afterwards reprinted in Purchas's Pilgrims. His time, however, was principally occupied with his *Arithmetica Logarithmica*, which was published in London in 1624. This work, the result of enormous labour, contains the logarithms with their differences, of 30,000 natural numbers to 14 places of figures, besides the index, viz. from 1 to 20,000, and from 90,000 to 100,000. In this work, he likewise explains the construction and use of the tables; and such was his anxiety to induce other mathematicians to compute the intermediate numbers, that he offered to give instructions and *paper ready ruled for the purpose*, to any persons who were disposed to assist in the completion of the labour which he had begun. This task was undertaken and completed by Adrian Vlacq, who reprinted at Gouda in 1628, the *Arithmetica Logarithmica*, with all the intermediate numbers, to 10 places of figures.

Briggs likewise completed a table of logarithmic sines and tangents to the 100th part of each degree, to 14 places of figures, besides the index; a table of natural sines to 15 places; and a table of tangents and secants to 10 places; but he was taken ill while engaged in shewing the application of these tables to plane and spherical trigonometry, and he committed the execution of this part of his plan to Henry Gellibrand, who willingly discharged this last duty to his friend. The

* In one of these letters, dated 1615, he says, "Napier, lord of Merchiston, hath set my head and hands at work, with his new and admirable logarithms. I hope to see him this summer, if it please God, for I never saw a book which pleased me better." Usher's Letters, p. 36.

† The following account of the meeting between Briggs and Napier of Merchiston Castle must be highly interesting to every reader. It is given in the Life of Lilly, the famous astrologer, which was published at London in 1721.

"I will acquaint you with one memorable story related unto me by John Marr, an excellent mathematician and geometrician, whom I conceive you remember. He was servant to king James I. and Charles II. When Merchiston first published his logarithms, Mr. Briggs, then reader of the Astronomy Lectures at Gresham college, in London, was so surprised with admiration of them, that he could have no quietness in himself, until he had seen that noble person, whose only invention they were: He acquaints John Marr therewith; who went into Scotland before Mr Briggs, purposely to be there when these two so learned persons should meet. Mr Briggs appoints a certain day when to meet at Edinburgh; but failing thereof, Merchiston was fearful he would not come. It happened one day, as John Marr and the lord Napier were speaking of Mr Briggs: "Mr John," saith Merchiston, "Mr Briggs will not now come." At the very instant one knocks at the gate. John Marr hasted down; and it proved to be Mr Briggs, to his great contentment. He brings Mr Briggs up into my lord's chamber, where almost one quarter of an hour was spent, each beholding the other with admiration, before one word was spoken: at last Mr Briggs began. "My lord, I have undertaken this long journey purposely to see your person, and to know by what engine of wit or ingenuity you came first to think of this most excellent help unto astronomy, viz. the logarithms. But my lord, being by you found out, I wonder nobody else found it out before, when now being known it appears so easy." He was nobly entertained by the lord Napier; and every summer after that, during the laird's being alive, this venerable man, Mr Briggs, went purposely to Scotland to visit him.

work was published at Gouda in 1633, under the care of Adrian Vlacq, and was entitled *Trigonometria Britannica*.

On the 26th of January, 1630, Briggs terminated his labours at the advanced age of 74, and his remains were deposited in the choir of the chapel of Morton College, under the honorary monument of sir Henry Savile.

In his private character, Briggs was distinguished by the frankness of his manners, and by the strictest integrity. He was fond of retirement and study, and enjoyed a high reputation among the mathematicians of the 16th and 17th centuries.

"In the construction of his two works on the logarithms of numbers, and of sines and tangents," says the learned Dr Hutton, "our author, besides extreme labour and application, manifests the highest powers of genius and invention; as we here, for the first time, meet with several of the most important discoveries in the mathematics, and what have hitherto been considered as of much later invention; such as the binomial theorem,* the differential method and construction of tables by differences; the interpolation by differences; with angular sections, and several other ingenious compositions."

Besides the works which we have already mentioned, Briggs published *Tables for the Improvement of Navigation*. Lond. 1610, 4to. *Description of an Instrumental Table to find the part proportional devised*, by Mr E. Wright, 1616, 1618. *Lucubrationes et Annotationes in opera posthuma*, J. Neperi, Edin. 1619, 4to. *Euclidis Elementorum vi. libri priores*. Lond. 1620, folio. *Mathematica ab Antiquis minus cognita*.

The unpublished works of Briggs are, *Commentaries on the Geometry of Peter Ramus*. *Dux Epistola ad celeberrimum virum, Chr. Sever. Longomontanum*. *Animadversiones Geometricæ*. *De eodem Argumento*. *A Treatise of common Arithmetic*. *A Letter to Mr. Clarke of Gravesend*, Feb. 25, 1606. The last four of these MSS. were in the possession of the late Mr Jones. See Hutton's *Mathematical Dictionary*; Ward's *Lives of the Professors of Gresham College*, p. 120.; and Smith's *Comment. de vit. et stud. H. Briggs*, Lond. 1707, 4to. (o)

BRIGHTON, or more properly BRIGHTHELMSTONE, a celebrated bathing place in the hundred of Whalesbone, and county of Sussex, $8\frac{1}{4}$ miles from Lewes, and 55 from London. It was formerly an inconsiderable town, inhabited chiefly by fishermen, and it was only within these few years since it became a fashionable place of resort for sea-bathing, that it was enlarged with many new streets, and ornamented with some elegant buildings. It stands chiefly on an eminence, and slopes gently on the east towards the Steyne, a beautiful lawn, where the company generally promenade; and it is well sheltered from the north and north-east winds by the South Downs, which furnish its visitors with excellent mutton. The streets nearly intersect each other at right angles, and are very neat, clean, and uniform. The Steyne and Crescent are handsomely built, and consist chiefly of lodging-houses, which are considered even superior to those of Bath; and North-street furnishes shops of every description equal to Bond-street. On the north-west of the Steyne stands the Marine Pavilion, the occasional residence of the Prince of Wales. It has a handsome sea-front, extending 200 feet, and in the centre a circular building, with a lofty dome raised

on pillars. Two wings were lately added, and the whole is fitted up with the greatest taste and magnificence. Adjoining is a handsome family mansion of the duke of Marlborough. Brighton has a convenient little theatre, public libraries, and two assembly rooms, that may vie in elegance with any in the kingdom, and which are open every night during the season. The church is an ancient structure, with a square tower, and stands on a hill at a small distance from the town; but, from the increase of population, a chapel royal has been lately erected sufficient to accommodate 1000 persons. Besides these, there are a Quaker, an Independent, a Methodist, and a Baptist meeting, a Roman Catholic chapel, and a Jewish synagogue. The baths are situated near the Steyne, and were first erected in 1789. They are elegantly fitted up, and consist of hot, cold, vapour, and salt water baths; also air-pump water baths for those who are affected with the gout, or violent scorbutic affections. About a mile west from the town is a valuable chalybeate spring, which is much frequented, and which has been found very serviceable in several cases of debility and indigestion. It was first inclosed by Dr Richard Russel, and the proprietors have since erected a handsome lodge over it.

From its vicinity to the metropolis, the pleasantness of its beach, and its other accommodations, Brighton is in general preferred to every other fashionable watering place. This town was formerly fortified with a flint wall three feet thick, towards the sea, and a block house for ammunition. These, however, were completely undermined by the violent storms of 1703 and 1705, which also destroyed 113 tenements, and a good deal of the adjacent lands. Since that time, great depredations have been made on this shore by the encroaching waves. In 1786, one of the batteries was thrown down by a high tide, and several of the guns washed into the sea; and considerable sums have been expended by the inhabitants in raising artificial barriers to counteract its ravages. The chief support of Brighton are its baths and fishery; and this last employs about 100 boats, carrying from three to five men each. The mackerel fishing commences in April, and that for herrings in October; and they are said sometimes to produce nearly 10,000*l.* per annum. This town has no corporation; but, by an act passed about thirty years ago, thirty-six of the inhabitants, as commissioners, were empowered to erect a market, pave, light, and clean the streets, and execute other necessary matters. Its market day is on Thursday, and it has two fairs, on Holy Thursday and the 4th of September. It is the station for packets between the Sussex coast and Dieppe; and, in time of peace, many travellers prefer this passage to that of Dover, as the rout by land is much shorter from Dieppe, by way of Rouen, to Paris, than from Calais. The races are usually on the first week of August, and last for four or five days. It contains 1424 houses, and 7339 inhabitants. Of these 3274 are males, and 4065 females; and, in 1801, 3050 were returned as employed in trade and manufactures. This number, however, cannot be called the actual population, as above a fourth of them remain only during the summer, as visitants, shop keepers, attendants, &c. W. Long. $11^{\circ} 55'$, N. Lat. $50^{\circ} 49' 32''$. See Lee's *History of Lewes and BRIGHTHELMSTONE*; and *Guide to the Watering Places*. (p)

BRINDISI, or BRANDISO, a city of Italy, situated in

* Briggs actually gave the substance of the binomial theorem in words.

the Terra-D'Otranto, and kingdom of Naples, was known in ancient times by the name of Brundisium; and was the scene of many important events in Roman history. It is impossible to ascertain its original founders; but it is known to have been taken by Attilius Regulus from the Salentines, in the year before Christ 256. In this place, Pompey the Great sought refuge from the power of Cæsar, by whom he was closely blockaded; and from whose skilful approaches, he, with great difficulty, made his escape to Greece. This town and its garrison declared, at an early period, for Octavianus, afterwards Augustus, and put him in possession of all the military stores which his uncle, Julius Cæsar, had collected for his intended expedition to Parthia. It was soon after besieged by Mark Antony; and, Octavianus having advanced to its relief, found his legions so reluctant to fight against their countrymen, that he was obliged to come to an accommodation with his rival; which was effected by the mediation of Pollio and Mæcenas, and confirmed at Brundisium by the marriage of his sister Octavia to Antony. It was farther celebrated, as the birth-place of the tragic poet Pacuvius, and as the scene of the death of Virgil. It suffered greatly during the ravages of the Vandals in Italy; and in the year 836, was almost completely destroyed by the Saracens. The Greek emperors were very desirous to retain it in their possession, and to restore its ancient prosperity; but, before they could effect their intended improvements, they were driven from it by the Normans under William I. It recovered much of its splendour during the successive expeditions to Palestine, for which its excellent harbour presented a convenient point of embarkation; and it particularly benefited by the presence of the emperor Frederick, who made it a principal place of rendezvous to his armaments for the Holy Land; but by the loss of Jerusalem, the fall of the Greek empire, the conquest of the east by the Turks, and the consequent ruin of the trade of the Levant, the town of Brindisi lost all its importance, and was reduced to a state of desolation, from which it has never recovered.

Of ancient Brundisium little now remains but the column of the light-house; a large marble bason, into which the water flows from brazen heads of deer; numbers of broken pillars, which have been removed from their former stations to the corners of the streets, to protect the houses from the wheels of carts; frequent fragments of coarse mosaic, which had composed the floors of ancient habitations; inscriptions, coins, ruins of aqueducts, and a few other similar vestiges of antiquity.

Of the present city of Brindisi, the walls still include a large space; but the inhabited houses do not occupy half the inclosure. The streets are crooked and badly paved; the buildings mean and ruinous in their appearance; and none of the public edifices in any respect remarkable. The only structures at all deserving of notice, are the cathedral, built by king Roger, and dedicated to St Theodore; the citadel, a large and stately building, erected by the emperor Frederick II. to defend the northern branch of the harbour, and repaired by Charles V.; and the walls of a palace, near the port, built by Walter de Brienne, of gray stone, divided, at regular distances, by broad courses of black marble, but the greater part of which has been pulled down, to supply materials for the new canal at the entrance of the inner harbour.

But the most remarkable object in Brindisi is its double harbour, which has a very peculiar appearance, and is reckoned the finest in the Adriatic. Two promontories stretching out gradually as they advance into the sea, form the outer port, which is protected from the fury of the waves, by the island of St Andrew lying between the capes, and which thus presents a large triangular space, in which vessels of considerable burden may safely ride at anchor. At the bottom of this bay, where the two promontories unite to form an angle, is a narrow channel, admitting the water into the inner port, which extends itself on each side in the shape of a semicircle, embracing the city like two arms, bearing some resemblance to a stag's head and horns. From this appearance, the name Brundisium is supposed to have originated, which is said to be an old Massapian word, signifying the head of a deer. This harbour is conjectured to have been produced by the sinking of the ground, in consequence of an earthquake, as the hills around it are upon an exact level, and exhibit parallel correspondent strata. It extends two miles and a half in length, and is twelve hundred feet broad at the widest part. It has a great depth of water, is sheltered by the hills and the town on every side, and is excellently adapted for every purpose of navigation and trade. The communication between the two havens, was formerly marked out by means of lights, placed upon columns of the Corinthian order, erected on a rising ground in a direct line with the channel. Only one of these, of a green and white marble, remains entire upon its pedestal. Its capital is adorned with figures of syrens and tritons, intermingled with the acanthus leaf; and upon the summit is a circular vase, which formerly contained the fire. The soil in the neighbourhood of the town is light and good, and produces excellent cotton, of which the inhabitants manufacture stockings and gloves. The position of the place is central, and in the whole kingdom of Naples a finer situation for trade is not to be found. But, by one fatal circumstance, the obstruction of the channel, which unites the outer and inner havens, this unhappy city was deprived of all its natural advantages, and desolated by the most afflicting evils. Its ruin may be said to have been begun by Julius Cæsar, when, in order to block up the fleet of Pompey, he drove piles, and threw heaps of rubbish into the space of communication. In the fifteenth century the prince of Taranto caused several ships to be sunk in the middle of the passage, to prevent the royalists from entering the port, and thus provided a resting place for the sand and seaweed, which soon accumulated to such a degree, as to render the entrance impassable to vessels of every description. In 1752, the bank had increased so much, that, except in rainy seasons, and during violent easterly winds, even the waves were completely excluded; and, from that period, the inner port became a green fetid lake, full of noxious insects, and infectious effluvia; so that no fish could live in it but eels, and no boat ply upon its surface but the smallest canoes. The low grounds at each end were converted into stagnant marshes, the vapours of which created every summer an actual pestilence, which, in the course of a few years, destroyed or drove away the greatest part of the inhabitants, so that from 18,000 they were reduced, in 1766, to 5000 miserable looking creatures, tormented with agues and fevers; and of this number not less than 1500 were carried to their graves during the autumn of 1775, in a climate, which, 30 years before, was esteemed so

salubrious and balsamic, that the convents in Naples were accustomed to send their consumptive friars to Brindisi for the restoration of their health. In this state of wretchedness the remaining citizens applied for relief to Don Carlo Demarco, one of the king's ministers, who was himself a native of Brindisi; and, in consequence of this representation, Don Andrea Pigonati, an able engineer, was sent with plans and instructions for the improvement of the harbour. The marshes, at each extremity of the inner port, have been filled up with earth, and a dam constructed to prevent the water from returning upon those low grounds. The channel has been cleared so far, as to form a canal with a depth of two fathoms of water, capable of admitting pretty large boats, and to afford a free passage to the sea, which now rushes in and out at every tide with great impetuosity, giving motion to the water of the inner harbour, which is thus again rendered pure and wholesome. In clearing this opening, several seals and medals were found by the workmen; and many of the oak piles which had been driven in by Cæsar, and which had remained above eighteen centuries seven feet under the sand, were drawn up in as fresh a state as if they had been cut only a month before. The canal or gut is designed to extend in a straight line seven hundred yards; and, if the plan were accomplished, a harbour will be formed, completely land-locked, capable of containing a whole navy, and of admitting vessels of the greatest burden. But apprehensions are entertained, whether the work can be properly secured against accidents, and kept in a sufficient state of repair, without a considerable annual expence; and great difficulty has been experienced in rendering the piers strong enough to resist the violence of the sea, and preventing the re-accumulation of the sand by the tides. By these operations, however, a return of health, and a prospect of commercial prosperity, have been already opened to the citizens of Brindisi; who have resolved, in gratitude for so great blessings, to erect a statue to the king, with inscriptions upon its pedestal to the minister, and his agents.

Since this town was visited by Mr Swinburne, these improvements have been carrying on under the direction of Don Carlo Pollio, an able engineer. In removing the earth from one of the banks, for the purpose of covering the marshy grounds, the workmen discovered the foundation of a house, which appeared to have been inhabited by a Roman. The distribution of the apartments level with the ground, the canal for the bath, and the bed-chamber, with mosaic work, and the motto of *bene dormio*, I sleep well, were distinctly seen. Among the rubbish there were also found the statue of a woman, and two heads of ancient philosophers.

Beside the causes which we have already assigned for the ruin of Brindisi, there is another which is deserving of notice. During the long war which the Venetians waged against the Turks, a fleet of the republic was always stationed in the port of this city. The Venetians admired the wines which were made in the adjacent country, and paid a high price for them. The avarice of the inhabitants, however, was greater than their prudence; they tore up all their olive trees, and replaced them with vines, in order to supply a demand which they never seem to have regarded as temporary. But when the Venetians left Brindisi, the produce of the

vineyards could not find a market, while oil was not to be had: Population 2042.* East Long. 17° 40', North Lat. 40° 48'. See Swinburne's *Travels in the two Sicilies*, vol. i. p. 383.; Stolberg's *Travels in Germany, Switzerland, Italy, and Sicily*, 1791, 1792; and *Annales des Voyages*, &c. par Malthe Brun, tom. iii. p. 209. (7)

BRINDLEY, JAMES, was one of the small number of unlettered and uneducated men, who, sustained solely by the powers of their own minds, have used them with such wisdom and success, as to acquire not merely parochial or provincial celebrity, but to attract the admiration of the age and nation in which they lived, and leave to posterity, in their productions, a lasting monument of their intellectual resources. It was, indeed, fortunate for the subject of this memoir, as well as for his country, that he was cotemporary with a nobleman, the Duke of Bridgewater, whose liberality and science conferred distinction on his rank. Without such a concurrence, an opportunity might have been wanting to this ingenious projector, of convincing the world, that his projects, though bold and surprising, were not impracticable. James Brindley was born at Tunsted, in the parish of Wormhill in Derbyshire, in the year 1716. The total neglect of his education is attributed to domestic difficulties, incurred, in a great measure, by his father's imprudent devotion to field-sports, though he possessed but a very small free-hold. Young Brindley, in consequence of his father's indiscretion, was obliged to lend his childhood to such labour as it was equal to, instead of employing it in acquiring the elements of future improvement in letters, or in science. Having reached his seventeenth year, he bound himself apprentice to Mr Bennett, a millwright, near Macclesfield in Cheshire; in which employment he soon taught his master to confide in his judgment, and stood much above him in the opinion of the millers. Before the expiration of his apprenticeship, he had the satisfaction of seeing that his master, who was now grown old, derived a comfortable subsistence for his family from his industry and reputation. Some opinion may be formed of his devotion to his favourite occupations from the following fact: Mr Bennett having inspected an engine paper-mill, had undertaken to erect one; but, before its completion, a millwright, who happened to see it, did not scruple to say, that it would never work as was proposed. Brindley, who appears to have doubted the correctness of his master's representation, took the pains to visit it at the distance of fifty miles, which he performed in the only interval that could be spared him, betwixt the Saturday evening and Monday morning following. His suggestions are said to have enabled his master not merely to execute his promise, but to improve upon the original design.

As soon as he was free to act for himself, he professed the occupation of millwright on his own account; and, before he had reached his fortieth year, his name was in the highest repute in all the counties in his vicinity. Some of the principal works to which he owed his reputation in those parts, were a water-engine, which he erected in the year 1752, at Clifton in Lancashire, for the purpose of draining some coal mines; a silk-mill, which he was employed to construct at Congleton in Cheshire; and a steam-engine, the boiler of which was of brick and stone, and the cylinders of wood hooped to-

* Stolberg, who visited Brindisi in 1792, makes the population of Brindisi 6000, but we have followed a later writer, M. Ange Masci, who has written a learned memoir on the origin, manners, and actual state of the Albanese.

gether, which he erected near Newcastle-under-line. From this time his whole strength was directed to the improvement of inland navigation; in which important design he co-operated with the Duke of Bridgewater. His Grace, having calculated the gains that might accrue from a canal which should connect his estate at Worsley, containing valuable coal-mines, with the populous and manufacturing town of Manchester, called in the advice and practical ability of Mr Brindley. After a careful survey, he pronounced the work, though difficult, not impracticable. The plan finally proposed, and for the execution of which an act of parliament was obtained in 1759, was, to carry the canal over the river Irwell, near Barton Bridge, to Manchester, and to lead off a branch to Longford Bridge, in Stratford. This was to be accomplished without the aid of locks, by preserving the same level through the whole course of the canal. After many difficulties had been surmounted, of sufficient magnitude to have deterred an ordinary man from the undertaking, the great labour remained, which was, to carry the canal over the river at the height of thirty-nine feet above the surface of the water. Though Brindley was confident of the practicability of the design, he wished his Grace to take the opinion of some able engineer before the attempt was made. A gentleman was accordingly consulted, to whom the scheme appeared to demand ridicule rather than deliberation. He is stated to have said, "that he had often heard of castles in the air, but was never before shewn where any of them might be erected." Neither Brindley's confidence, nor the Duke's acquiescence in his judgment, was shaken by this declaration. The work was begun in September 1760, and in the July of the year following a boat floated along the aqueduct. The design extended with the progress of the work; and another branch was opened from the canal, which was to be carried over the rivers Mersey and Bollan, besides many deep vallies, in its extension to the tideway in Mersey. Here the obstruction of locks was also avoided. High mounds of earth were raised across the vallies, the ridges of which became the bed of the canal. In order to reduce the labour and cost of the work, Brindley suggested the simple method of bringing boats filled with earth along the channel, as far as it was wrought; at which point a caisson, or cistern made of timber, received the boat, and the bottom being opened, its load of earth descended, and gradually displaced the water. In consequence of the successful issue of this undertaking, the remainder of Mr Brindley's very useful life was chiefly employed in making surveys; laying out canals, and sometimes superintending the execution of his plans. Of this number, the most remarkable is the Grand Trunk Navigation, as he called it, which is carried through a space of ninety-three miles, from the Trent to the Mersey. This design was completed in eleven years, five years after the decease of the projector. It was furnished with seventy-six locks, and conducted through not less than five tunnels, one of which pierces through Air-Castle-hill, and is 2880 yards in length, and more than seventy yards below the surface of the earth. The counties of Durham, Westmoreland, Lancaster, York, Chester, Stafford, Worcester, Warwick, Somerset, Sarum, Devon, Hants, and Oxford, have all derived local improvement and advantages, either from his surveys, plans, or superintendence of inland navigations. It is probable, that a man more unlettered than Brindley, never obtained distinction in any pursuit

connected with science. If it is not true, as has been said, that he could neither read nor write, yet it is certain that his writing was confined to a few occasional letters to his friends, and his reading appears to have been almost as circumscribed as his writing.

So little did the operations of his mind depend upon the use of visible signs, that the combinations of his machinery were often formed without their aid; and, when his employers have expressed no wish to see his plans delineated, they have ever been carried into execution without having even been expressed in figures. To aid the abstraction of his mind, when engaged in complex arrangements, he was accustomed to retire to his bed, and remain there till the design was mentally completed, sometimes as long as two or three days. His memory, which was never taught to distrust itself, and commit its possessions to paper, was in no danger of suffering any link in his mechanical arrangement to escape. Of this he was so confident from experience, that he often declared, if he had time enough to complete his combinations, he was perfectly secure of retaining every part of the design, however complex.

Mr Brindley was endowed by nature with great powers of mind, but they never possessed that flexibility of application which might have been produced by the various exercises of a liberal education. He thought vigorously and justly in his own particular sphere; but when placed in circumstances in which it was natural he should apply his reason to subjects of which he had no knowledge, he expressed all that uneasiness which must arise in a mind fond of order in the midst of inextricable confusion. Hence it is related of him, that, after having once seen a play in London, he declared, that the spectacle produced such distraction of thought, as to unfit him for some time for his customary pursuits, and he never would repeat the experiment. During several of the last years of his life, Mr Brindley was afflicted with a hectic fever almost without intermission. He did not survive his fifty-sixth year. He died September 27, 1772, and was buried at New Chapel in Staffordshire. See *Biograph. Britan.* (J. M.)

BRINE SPRINGS. See SALT.

BRISAC, BRISACH, or BREYSACH, a city of Germany, and capital of Brisgaw in Alsace, was formerly one of the strongest towns in Europe, and from its strength, has been denominated *the Citadel of Alsace, the Head of Germany, the Pillow of Austria*. In 1331, it was mortgaged by the Emperor Louis of Bavaria, to Otto Duke of Austria, and the transfer was ratified by Charles V. in 1348. Gustavus Horne, a Swedish general, after having acquired great advantages over the imperial army, made an attempt upon Brisac in 1633, but was thwarted in his designs by the activity of the Duke of Ferrara. In 1638, it was besieged by Bernard of Saxony, Duke of Weimar, and compelled to surrender, after having been reduced by famine to such extremities, that the governor found it necessary to place guards upon the burying grounds, to prevent the inhabitants from digging up and devouring the dead. It was soon after occupied by the Marshal of Guebriant in the name of Louis XIII. of France, to whom it was formerly ceded, both at the peace of Westphalia in 1648, and at the peace of the Pyrenees in 1659; but it was restored to the Emperor of Germany in 1700, after a stone bridge, built over the Rhine in its vicinity, had been destroyed. It was taken again by the French in 1704, with an army of 40,000 men under the Duke of Burgundy, after the trenches had been opened against it.

only three days; but, upon suspicion of treachery, its governor, Count D'Arce, was beheaded; the second in command, Count Marsigli, sentenced to have his sword broken over his head by the hands of the common hangman; and all who signed the capitulation subjected to punishment. It was restored to the empire in 1715, with many of its strong works dismantled; and in 1741, its fortifications were completely destroyed by order of Maria Theresa, Queen of Hungary and Bohemia. A bridge of boats over the Rhine was also broken down, and there is now only a ferry in its place. It is thus described by Bishop Burnet, as it appeared in 1685, before it had undergone these successive demolitions. "The town of Brisac riseth all on a hill, which is a considerable height. There were near it two hills; the one is taken within the fortifications, and the other is so well levelled with the ground, that one cannot so much as find out where it was. All the ground about, for many miles, is plain, so that from the hill, as from a cavalier, one can see exactly well, especially with the help of a perspective, all the motions of an army in case of a siege. The fortification is of a huge compass, above a French league, indeed almost a German league. The bastions are quite filled with earth; they are faced with brick, and have a huge broad ditch full of water round them. The counterscarp, the covered way, (which hath a palisade within a parapet,) and the *glacis*, are all well executed. There is a half moon before every *cortin*; the bastions have no *orillons* except one or two; and the *cortins* are so disposed, that a good part of them defendeth the bastion. The garrison of this place, in time of war, must needs be 8000 or 10,000 men. There hath not been much done of late to this place, only the ditch is so adjusted that it is all defended by the flanks of the bastions." It is situated on the right bank of the Rhine, 27 miles north of Basle, and 40 from Strasburg. N. Lat. 48° 51', E. Long. 7° 49'. (q)

BRISAC, New, a town of France, in the district of Colmar, and in the department of the Upper Rhine, is situated directly opposite to Old Brisac, and stands about a mile's distance from the left shore of the Rhine. It was built by Louis XIV. and fortified by the celebrated Vauban. It stands entirely on a plain, and the streets are so regularly disposed, that all the gates may be seen from the market-place. It contains nearly 2000 inhabitants. (q)

BRISOT, JAMES PETER, from whom the only party justly denominated republican, that possessed the powers of government during the French revolution, received the name of Brissotines. This ardent political reformer was born at Chartres, in the Orleanois, in the year 1754. His father, who was a *traiteur* or master of an eating house, having designed him for the law, gave him a liberal education, and enabled him to serve as clerk five years, with a view to that profession. He had, however, before the end of that period, contracted a dislike either to the study or the practice of the law, and the resolution which he soon took of abandoning the pursuit, naturally drew upon him the displeasure of his father. From this time he depended solely upon his own resources, and the aid of some friends, who were willing to support him in the application of his talents to general literature. His exertions were sufficiently profitable, coupled as they were with habits of the strictest economy, to enable him to subsist himself at Paris; and on his father's death, he was also able to discharge his pecuniary obligations to his friends. Politics appear to

have engaged his principal attention from the commencement of his studies, and he now presented the public with the first fruits of his labours, as the superintendant of a publication at Boulogne, entitled *Courier de l'Europe*. This paper was soon suppressed by government, when Brissot took up his residence once more at Paris. Before he quitted Boulogne, he had, however, been introduced to the mother of his future wife, who kept a lodging-house at that place. Her daughter, Mademoiselle Dupont, was engaged by Mad. de Genlis, as reader to the daughter of the Duke of Orleans. When she became the wife of Brissot, she discharged the duties of the conjugal relation so well, as to obtain the particular commendation of Mad. Roland for her domestic virtues. The productions of Brissot's pen at this period, (about the years 1780 and 1781,) were, the *Theory of Criminal Law*, 2 vols. 8vo; the commencement of a work, entitled, *A Philosophical Library of Criminal Law*, which was afterwards completed in 10 volumes; one volume on *Truth*, intended to be preliminary to a more ample discussion; and two discourses on subjects connected with *Criminal Law*, which were crowned at the academy of Chalons sur Maine. Brissot, who possessed all the zeal of a political reformer from the very commencement of his career, soon took leave of Paris; and, having made a short visit to Geneva and Neufchatel, passed over into England, and fixed his residence in London, in prosecution of a design of conducting a periodical publication, to be entitled, "A Universal Correspondence on points interesting to the welfare of Man, and of Society." London was chosen as the centre where information was to be collected from all points, and from which it was to issue in all directions through the medium of this publication. In this way, it was thought possible to evade the restriction upon the press in France, and illuminate that country, by means of presses employed in England, Switzerland, and Germany. The design failed, and the cost of the experiment subjected Brissot to an arrest in London, from which he was freed by the liberality of a friend. On his return to Paris, he pursued the same course of literary and political labour; and being connected, as was supposed, with the Marquis of Pelleport in a publication which gave great offence to government, he was committed to the Bastille in July 1784. His liberation was soon obtained through the mediation of the Duke of Orleans; but it was not long before a *lettre de cachet* was again issued against him, in consequence of an attack which he had made on the administration of the Archbishop of Sens. At this time he was a resident in the Palais Royal, and received a liberal salary as secretary to the chancery of the Duke of Orleans. He escaped imprisonment by a journey to Holland, and a temporary abode at Mechlin, where he edited a paper, called *The Courier Belgique*. Unable to succeed in his plans of political improvement in Europe, in the year 1788 he crossed the Atlantic, for the purpose of promoting the designs of the society called *Les Amis des Noirs*, which aimed at the abolition of Negro slavery; and also in order to choose some part of the American territory, to which a colony of the French were to emigrate, and to erect themselves there into a pure republic. Before his departure from Paris, his thoughts had been much employed on the subject of American connection, and a work was produced by him in conjunction with Claviere, entitled, "The Commerce of America with Europe, particularly with France and Great Britain, stated and explained;" and, on his return from

the western world, he published his travels in America ; more remarkable for the display of the sanguine views and wishes of the writer, than for profound and just reflection.

At length, the events which immediately preceded the French revolution, promised to the ardent mind of Brissot that amelioration of the social state, which had long employed his speculations and animated his exertions. Previous to the assembly of the states general, he published a plan of conduct for the deputies of the people. On the storming of the Bastille, the keys were deposited with him. He was appointed president of the Jacobin club. Frequent publications, tending to republicanism, issued from his pen ; and on the flight of the king to Varennes, he no longer hesitated to lend his voice to the establishment of that form of government. In the year 1791, he was chosen one of the representatives in the legislative assembly, of which he was also appointed secretary. Though it is certain that several in that celebrated body possessed talents, and had made acquirements, far exceeding those of Brissot, yet such was his zeal, activity, and reputation for integrity, that he was regarded, as, in some sort, the leader of the party called Girondists ; which party was, in a great measure, composed of men the most distinguished in all France, both for literary and scientific attainment, and for public virtue. Brissot himself was an honourable pattern of the self-denying virtues. His abode was up four pair of stairs, and his income arose solely from the sale of a newspaper, of which he was a proprietor, and his stipend as deputy. The fluctuating policy of Louis XVI. induced him to commit to Brissot the appointment of a new and popular ministry, on the removal of Delessart and his colleagues from power. Dumourier, Claviere, and Roland, were appointed, and the ruin of La Fayette was decreed. Articles of accusation against that general were soon exhibited, signed by Brissot and six other members of the assembly, in which surmise supplied the place of evidence. Though it may be thought that the writings of Brissot at this time naturally prepared the way for the atrocities of the 10th of August, 1792, yet during the massacre of the Swiss guards, he was not inactive on the side of humanity, and several lives were preserved by his exertions. That event was soon followed by the suspension of the king's authority ; and the declaration to the neutral powers on that occasion, was the production of Brissot. On the meeting of the national convention, a body very differently constituted from the assembly which preceded it, though Brissot took his place as member for the department of Eure and Loire, he soon found himself engaged in an unequal conflict, with a faction formidable for their intrepidity and ferocity, if not for their talents, and now rendered invincible by possessing the favour of the Parisian populace. This party, which was described by the name of the Mountain, consisted partly of the partizans of the profligate Duke of Orleans, partly of ambitious demagogues, who wished to abuse the name of liberty to the worst purposes of tyranny, and perhaps of a small number of honest but fierce and intractable supporters of pure democracy.

Against such men as Marat, Danton, Robespierre, and their fit coadjutors and adherents, the comparative moderation and mild policy of the friends of Brissot were not likely long to maintain their ground. In vain did Brissot and his companions attempt to save the king from the scaffold, after having found him guilty at the bar.

In vain did they warn the people of their danger from factious leaders and artful declaimers. The invading army was within the frontiers of the republic ; Dumourier had abandoned his post ; and the manifesto of the Duke of Brunswick threatened Paris with desolation. Terror has an easy conflict with reason ; and the only true friends of the people that yet remained in the metropolis were rendered objects of popular suspicion by their adversaries. In the months of May and June, 1793, the arrest of the faction of the Girondists was decreed. Brissot was taken in his attempt to fly into Switzerland, after an interval of several months, on October 24, 1793. Raised upon a seat amidst his companions, Brissot was brought to a mock-trial before the revolutionary tribunal. They were condemned to the guillotine. The night preceding their execution, they passed together, and on the fatal morning, Brissot fell beneath the knife, the seventeenth upon the list, without betraying any marks of anger or dismay. That he mingled in the struggles of a revolutionary period without guilt, will scarcely be believed ; but candour may allow, that his errors arose, rather from an excess of ardour, than any defect of principle or humanity. See *Life of Brissot*, prefixed to his Works. (J. M.)

BRISTOL, the *Caer Brito* of the Britons, and *Bright-stow* of the Saxons, stands on an elevated peninsula, formed by the rivers Frome and Avon, partly in Somerset, and partly in Gloucestershire ; and for wealth, trade, and population, is the second city of England. According to a tradition of William of Worcester, Bristol was built by Brennus, a prince of the Britons, 380 years before the Christian æra ; in allusion to which, two statues are placed over St John's gate, emblematic of Brennus and Belinus, who are said to have reigned conjointly after the decease of their father. However this may be, it is evident that Bristol was, at an early period of our history, a place of considerable importance. It is mentioned by Gildas under the name of *Caer Brito*, among the fortified cities of Britain, as early as A. D. 430 ; and also by Nennius in 620, in his enumeration of the 28 cities of Britain. It was first encompassed with a strong wall by Robert, the illegitimate son of Henry I., who, in 1130, also rebuilt and improved the castle, which, excluding the outworks, was 450 feet in length, and 300 in breadth. This fortress was long considered a place of great strength, and stood for seven centuries the subject of much negociation and contention. It was razed to the ground by order of Oliver Cromwell, in 1665, and the only vestiges which remain, are now incorporated with other buildings. Though Bristol has often been the scene of contention, and has frequently suffered from the vicissitudes of war, yet it has been continually increasing in extent and opulence, until it has attained its present eminence as one of the principal cities of Europe. Besides the peninsula between the Frome and the Avon, which contains the old town, St Michael's hill and King's Down on the north, College Green on the west, and Radcliffe hill on the south, are covered with public and private buildings, the whole extending over a surface of nearly 1500 acres of ground. The city contains 600 streets, lanes, squares, courts, &c. with 17 churches, and about 30 chapels or meeting-houses. It is above seven miles in circumference, two-thirds of it being on the Gloucestershire side of the river ; and including the suburbs from Lawrence hill on the east, to the hot wells on the west, it is more than three miles in length. The streets in the old town are crowded and irregular, and most of

the houses are built of wood and plaister. Great improvements, however, have lately been made. Many of the streets have been widened, particularly the avenues leading to the river, which, from being formerly very steep, are now rendered easy and convenient. But the suburbs, and the external parts of the city, contain the most elegant and spacious buildings, which are composed entirely of brick and stone; all other materials being now prohibited in Bristol by act of parliament. These are chiefly inhabited by gentry, merchants, and retired tradesmen, or let as lodging houses. The principal public buildings are, the cathedral, the church of St Mary Radcliffe, and the exchange. The cathedral is only a part of the original church of the abbey of St Augustine, which was partly demolished at the dissolution of the monastery; and when Bristol was erected into a Bishop's see by Henry VIII., what remained was converted into the present cathedral. It is 173 feet long, and 128 broad, and, at the west end, has a large square tower 130 feet high, ornamented with battlements and 4 pinnacles. The establishment of the cathedral consists of a bishop, a dean, six prebendaries, and other inferior officers. The arch-deacon of Dorset has also a stall in the cathedral. The church of St Mary Radcliffe is one of the finest in the kingdom. It stands on Radcliffe hill, and is said to have been founded by Simon de Burton in 1292, and finished in 1376, and was then celebrated for the beauty and elegance of its architecture over all England. It was built in the form of a cross, with a tower and spire 250 feet high, and richly ornamented with carved work; but in 1445, part of the spire was destroyed by lightning, and the church much damaged. The spire has never since been rebuilt, but the church was repaired by the munificence of William Canninge, a mayor of Bristol, of whom it contains two beautiful monumental statues, one habited as a magistrate, and the other as a priest, he having, in his latter days, taken holy orders. Though a massy and lofty building, yet, from the peculiar beauty of the mason work, this church has a light and airy appearance. The exchange, in Corn-street, is a handsome structure in the Grecian style, built by Wood the architect of Bath, at the expence of 50,000*l*. It is 110 feet in front, and 148 deep; and the place intended for the merchants is a peristyle of the Corinthian order, 90 feet by 80, capable of containing 1440 persons. The merchants, feeling the want of an accommodation similar to Lloyd's in London, determined upon building a commercial coffee room to supply the deficiency. A subscription was accordingly opened, and 17,000*l*. was raised in two days, 25*l*. being the amount of each share. The entrance to the building is from Corn-street, under an Ionic portico of four columns, supporting a grand pediment, on which are placed three beautiful colossal statues, representing the city of Bristol supported by navigation and commerce. The grand room is 60 feet long, 40 wide, and 25 in height. The other public buildings are, the theatre royal in King's-street, pronounced by Mr Garrick to be the completest in Europe of its dimensions; the assembly rooms in Prince's-street; the guildhall, mansion house, and custom-house. There are several benevolent institutions in Bristol; among which, are the general hospital for the reception of patients of every description, and of every nation; Queen Elizabeth's hospital, in which 100 boys are maintained and educated, six of whom are allowed 10*l*. each, and the others 8 guineas, to bind them apprentices; Colston's hospital, where the

same number of boys are maintained for seven years, and taught and apprenticed in the same way. This benevolent gentleman founded another hospital in 1691, for 12 men and 12 women, with an allowance of 3*s*. per week, and 24 sacks of coals in the year, for which he appropriated 25,000*l*.; and in conjunction with the merchants of the city, he instituted a third, in which are maintained 18 men on account of the merchants, and 12 men and women on account of Mr Colston. Bristol claims the honour of having shewn to the rest of England the first example of a regular provincial infirmary. It was founded in the year 1735, through the exertions and munificence of John Elbordye, Esq. and Dr Bonythorn, its first physician and treasurer, seconded with the assistance of the corporation and citizens at large. The gross receipts for the year 1810 amounted to 8968*l*.; in which year were admitted 1225 in-patients, and 2607 were relieved as out-patients. A new wing has lately been added, which cost about 10,000*l*.

The quay of Bristol is one uninterrupted wharf of hewn stone, extending nearly a mile along the inner shores of the Frome and Avon, from St Giles to Bristol bridge. At flood tides, there is sufficient depth of water for the largest vessels to ride close to the walls, and discharge their cargoes; but before the improvement of the harbour, they lay a-ground in the mud, at low water, from which they often received considerable damage. This circumstance, together with the difficult navigation to and from the Severn, through a narrow river, induced the inhabitants of Bristol to apply to parliament for an act to improve their port, and to amend the navigation of the Avon. This improvement has been of the greatest advantage to the city, and is a wonderful saving of time and expence to all who frequent the port. The bed of the Avon and Frome has been dammed up as far as the hot wells, and a new channel cut for the river through Radcliffe meads; and the navigation of the Avon in one level has been opened up as high as Keynsham. The harbour is now capable of accommodating 1000 vessels, which are not only kept afloat at the quays, but are enabled to enter the locks, and go to sea at neap tides. Upon changing the course of the Avon, two cast iron bridges were erected by Mr Jessop over the new channel. The span of the iron work of each arch is 100 feet, and the rise 12 feet 6 inches, or $\frac{1}{4}$ of the span: (See BRIDGE, p. 528.) The wet docks here are very extensive, and the merchant floating dock is said to exceed in dimensions even those at Portsmouth or Plymouth. This improvement of the harbour cost upwards of 300,000*l*., which was raised by shares of 135*l*. each.

Bristol has long been distinguished as one of the first commercial cities in the kingdom, and trades with more independence on the port of London than any other place in Britain. At a very early period, it carried on a considerable traffic with every part of Europe. Its harbours were filled with vessels from Denmark, Prussia, and the Hanseatic towns, which imported much foreign wealth into the country; and this city has always been ready in furnishing ships and money for the service of the nation. Many vessels were fitted out at this port for the purpose of discovery; and its merchants were among the first that entered into the West India trade, and engaged in the cod fishery on the coast of Newfoundland. Before the country was intersected with canals, the home trade of Bristol was greatly supported by its extensive communication with the Severn, Wye, and the other rivers on the west side of the island; and hence

it enjoyed the export and import traffic of a large part of the kingdom. Whatever exportations they made to any part of the world, they could import the full returns, and find a market, without consigning their cargoes to any other port. But since the canal navigation was established, this trade has considerably decreased, as the goods of Liverpool and London now find their way into the very heart of the country. Its foreign commerce, however, is in a more flourishing state, the principal branch of which is with the West Indies. They carry out materials for building, and every article necessary for clothing and maintaining the inhabitants; and bring in return the productions of the island, such as cotton, rum and sugar, &c. with which they supply all South Wales, and the western counties of England. They furnish the western cloth manufactories with wool from Spain, of which they annually import from 4 to 6000 bags, and give in exchange a variety of goods, particularly tin, lead, and copper. Great quantities of glass ware are exported to Ireland and America, especially bottles, of which nearly the half are filled with beer, cyder, perry, and Bristol water. Bristol carries on also a general trade with the north of Europe, Portugal, the Mediterranean, Africa, and Newfoundland.

In 1787, there were entered at the custom-house of Bristol,

<i>Inward.</i>		<i>Outward.</i>	
<i>Ships.</i>	<i>Tons.</i>	<i>Ships.</i>	<i>Tons.</i>
British, 416	48,125	British, 382	46,729
Foreign, 69	11,112	Foreign, 66	10,445

In the same year, the number of vessels belonging to this port amounted to 365, and their burthen to 55,809 tons. Of these, 328 were engaged in the foreign trade, 30 were coasters, and seven fishing vessels, &c. The following year they had considerably increased, as we find, by another computation, that they then amounted to 392 vessels; of which 34 were employed to Jamaica; 38 to the Leeward Islands; 50 to North America; 37 to Africa; 33 to Newfoundland; 200 to London, Ireland, and the Continent; besides 103 trows employed in the trade on the Severn and Wye. The commerce, however, of this port, received a severe check during the last and present war. The hand of industry was paralyzed, and the spirit of adventure almost entirely extinguished. But it is again beginning to revive, from the new improvements and conveniences of its harbour, and has rather been in the increase during this year or two (1812): for, notwithstanding the distress that has occurred in the commercial world, not a single bill has been returned by this city on the West Indies. In order to give our readers some general idea of the nature and quantity of the commodities imported into this city, we have collected, in the following table, the weekly imports of the three last months of 1811.

<i>Commodities.</i>	<i>Week ending Oct. 28. 1811.</i>	<i>Commodities.</i>	<i>Week ending Nov. 25, 1811.</i>	<i>Commodities.</i>	<i>Week ending Dec. 23, 1811.</i>
Sugar, - - -	542 hds. 54 trs. 8 bbls.	Spanish wool, -	35 bags.	Sugar, - - -	583 hds. 30 trs. 75 lbs.
Rum, - - -	131 puns. 3 hds.	Sugar, - - -	331 hds. 5 trs. 3 bbls.	Rum, - - -	110 puns. 20 pipes.
Brandy, - - -	30 pipes.	Rum, - - -	20 puns.	Lemons and oranges,	659 boxes, 9 chests.
Wine, - - -	91 pipes.	Wine, - - -	1 pipe.	Cyder, - - -	16 pipes.
Tobacco, - - -	307 hds.	Currants, - - -	43 butts.	Wine, - - -	4 hds. 3 pipes.
Rice, - - -	1 tierce.	Raisins, - - -	1012 bbls.	Lime juice, -	1 hhd.
Coffee, - - -	12 puns. 7 bbls.	Figs, - - -	5000 boxes.	Cork, - - -	55 cwt.
Ginger, - - -	3 bbls.	Tobacco, - - -	225 hds.	Pine timber, and plank,	491 pieces, 160 feet.
Juniper berries, -	400 sacks.	Fustic, - - -	20 tons.	Birch timber, -	6 pieces.
Oil, - - -	45 casks.	Logwood, - - -	35 tons.	Box wood, - - -	4585 lbs.
Sallad oil, - - -	10 half chests.	Mahogany, - - -	182 logs.	Lath wood, - - -	7 fathoms.
Turpentine, - - -	20 bbls.	Pine timber, -	1728 pieces.	Masts and spars,	33.
Tar, - - -	25 bbls.	Beech timber, -	61 ditto.	Staves, - - -	420.
Brimstone, - - -	40 tons.	Lath wood, - -	1634 ditto.	Horns, - - -	3300.
Fustic, - - -	3 tons.	Pine plank, - -	1000 feet.	Cod and seal oil,	345 casks.
Logwood, - - -	8 tons.	Deals, and deal ends,	2510.	Train oil and blubber,	59 hds. 23 casks.
Pine timber, - -	173 tons.	Staves, - - -	167,100.	Cod-fish, - - -	1242 cwt. 3 bbls.
Staves, - - -	31,500.	Seal skins, - -	123 bundles, 3 hds.	Cod-sounds, - -	19 kegs.
Cork, - - -	10 cwt.	Codfish, - - -	1444 quintals.	Seal skins, - -	294 bundles.
Spars and masts,	177.	Butter, - - -	1252 firkins, 643 casks.	Lard, - - -	45 bbls.
Handspikes, - -	535.	Bacon, - - -	11 bales.	Bacon, - - -	9 ditto.
Lancewood spars,	151.	Pork, - - -	20 bbls.	Pork, - - -	11 ditto.
Billets, - - -	1100.	Beef, - - -	139 trs. 26 half bbls.	Butter, - - -	50 casks.
Deals and deal ends,	4918.	Rags, - - -	2 crates.		
Linen, - - -	4 bales.	Feathers, - - -	18 bags, 7 packs.		
Butter, - - -	495 firkins.	Seed and train oil,	420 hds. 31 half bbls.		
Pork, - - -	50 bbls.		63 casks.		
Feathers, - - -	18 bags.				
Calf skins, - - -	20 bales, 109 bundles.				
Kelp, - - -	186 tons, 29 cwt.				

Bristol has many considerable manufactories, which furnish it with several valuable articles of exportation. Glass-making is carried on to a very great extent, and is greatly increasing; and more glass is said to be made here than at any other place in England. There are 20 sugar-houses, for the manufacture and refining of sugars; several large distilleries, which help to supply the London market, and which have also a considerable foreign exportation; a brass-rolling manufactory; extensive iron founderies, where cannon are cast and bored; a manufactory of zinc out of calamine stone; large soap-works, where the best hard white soap is made, which is sent to most parts of the kingdom, and of which great quantities are exported to America; manufactures of white and red lead, and of lead shot; turpentine, sulphur, and vitriol works; and a manufacture of china ware. In the neighbourhood of Bristol, are found those six-cornered stones called Bristol stones, which were formerly in such great request; and between this city and Bath, at a place called Warmley, a company of Bristol merchants have established an extensive manufactory of pins and other brass articles, which is wrought by water raised by two steam engines, and at which several hundred hands are employed, excluding 200 children of both sexes, from 7 to 12 or 13 years of age. The woollen manufactures of Bristol, for which it was formerly so famous, are now at an end, and nothing remains of this trade but a few serges and other stuffs. Besides its own manufactures, Bristol exports various commodities of the surrounding country, as cheese, cyder, and beer, herrings taken in the channel, salt from Droitwich, coarse woollens and stockings, hardware from Birmingham and Wolverhampton, and earthen ware from Staffordshire. It has two fairs in the year, on the first days of March and September, which continue for ten days, and are frequented by shopkeepers, from all parts of the kingdom.

The hot well, which is much frequented during the summer months, is about a mile west of the city, close to the Avon. It rises at the bottom of the cliff called St Vincent's rocks, between the high and low water marks, and is defended from the tide by a thick wall. The spring, according to Dr Carrick, discharges nearly 40 gallons in a minute. The water he found to be inodorous, sparkling, and pleasant to the taste; its temperature, as it issued from the pump, $74\frac{1}{2}$ deg. of Fahrenheit, and its specific gravity 1.00077. According to the doctor's analysis, a gallon of the water contains of muriate of magnesia $7\frac{1}{4}$ grains, of muriate of soda 4 grains, sulphate of soda $11\frac{1}{4}$ grains, sulphate of lime $11\frac{3}{4}$ grains, and carbonate of lime $12\frac{1}{2}$ grains, making altogether $47\frac{3}{4}$ grains of solid matter. It contains also 30 cubic inches of carbonic acid gas, and 3 cubic

inches of respirable air. These waters are highly useful to persons afflicted with consumption, diabetes, scrophula, all diseases of the liver, especially those brought on by irregular living; in atony, indigestion, dysentery, diarrhœa, and in many inflammatory complaints, and may be drunk as freely as the thirst requires it. We may mention a singular phenomenon, which was observed here on the 1st Nov. 1755, during the time of the terrible earthquake at Lisbon. The water of the well became, all on a sudden, as red as blood, and so turbid that it could not be drunk; and the tide of the Avon flowed back, contrary to its natural course. At the same time, a similar phenomenon was observed in the village of King's-wood, where the water of a common well, near St George's church, was turned as black as ink, and continued unfit for use nearly a fortnight.

Bristol was erected into an independent county by Edward III., in 1372; it having been formerly reckoned in the parliament-roll as belonging to Somerset. Since that time it has been endowed with various privileges and immunities. By a charter of Edward IV., in 1461, it was exempted from the authority of the high admiral of England by land and water; and such rights of judgment as formerly belonged to the court of admiralty, were referred to the corporation. Its jurisdiction by water was extended, by an act of William, as far up the river as Hanham, and down the channel to the Flat-holmes. The government of the city is vested in a mayor, 12 aldermen, including the recorder, who are all justices of the peace, 2 sheriffs, 28 common council men, town-clerk, deputy town-clerk, chamberlain, vice-chamberlain, under sheriff, &c. The mayor is allowed 1000*l.* to support the dignity of his office, and the two sheriffs 500*l.* each. All capital offences, and other crimes committed within the jurisdiction of the city, are tried by the mayor and aldermen: and all law suits that are purely civil, are determined by one of the judges on the western circuit, who comes to Bristol in the autumn of every year.

Bristol returns two members to parliament. They are chosen solely by the freemen of the city, who amount at present to nearly 8000. This freedom may be obtained by servitude, by hereditary right, by purchase, or by marrying a freeman's daughter. Bristol, in 1801, contained 16,896 houses, and 63,645 inhabitants, of whom the females exceeded the males by nearly a third; and 10,190 persons were employed in trade and manufactures. According to the late census, the united population of Bristol, Clifton, and Bedminster amounts to 71,279 persons, exclusive of sailors. West Longitude of the cathedral, $2^{\circ} 35' 28''$, North Lat. $51^{\circ} 27' 6''$. (A)

BRITAIN,

THE most considerable of the European islands, extends from fifty to fifty-eight and a half degrees of north latitude; being, of course, about 500 geographical miles in length. Its greatest breadth, from the land's end to the north foreland in Kent, 320 geographical miles. In British miles, the length may be computed 580, and the breadth 370.

With the various etymologies of the word *Albion* and *Britain*, we need not trouble the reader; most of them are fanciful, all of them seem conjectural. The earliest population of Britain is generally believed to have been Celtic. To the Celtic population of England succeeded the Gothic. The Scythians or Goths, advancing from Asia, drove the Cimbri, or northern Celts, before them; and, at a period long preceding the Christian æra, had seized upon that part of Gaul which is nearest to Great Britain, where they acquired the provincial denomination of *Belgæ*. Their passage to England followed of course; and, when Cæsar first explored this island, he tells us that the primitive inhabitants were driven into the interior parts, while the regions on the south-east were peopled with Belgic colonies. These Belgæ may be justly regarded as the chief ancestors of the English nation. The Saxons, who made the second conquest of England, were inconsiderable in numbers; nor did they exterminate the natives, but made them slaves; and, from the two Gothic dialects, of the conquerors and the conquered, being mingled, sprung the Anglo-Saxon, the parent of our English language. The opinion, it is true, of the population of all Britain being Celtic at the period of Cæsar's arrival, has found many supporters, but it labours under insuperable objections. The Anglo-Saxon, and the English language, have no traces of Celtic in them. They have even less of that Tudesque dialect of the Gothic, which the Angles and Saxons must have spoken at their arrival in Britain, than of the Belgic and Dutch dialects. This is what clearly must have sprung from our Danish and Jutland conquerors mixing a small portion of their dialect with the great body of the conquered people, who still retained the dialect of Belgium.

It has been objected to this statement of our early population, that Druidism, which is generally allowed to be a Celtic superstition, is mentioned by Cæsar in the earliest accounts of the island.

But to this objection it is answered, that Cæsar never speaks of having seen Druids; nor is there mention of any Druid having been seen till the Romans had penetrated into South Wales.

The Welsh are confessed a Celtic race. The Gael or Southern Celts, called Guydels by the Welsh, seem to have been the primitive Celts of ancient Britain. The most ancient names in Wales are Guydelic, not Cumraig or Welsh. These southern Celts are supposed to have been vanquished by the Cimbri of the north, the ancestors of the modern Welsh, who style themselves Cymri to this day.

Of the Gothic origin of the present inhabitants of the Lowlands of Scotland, we have the direct testimony of Tacitus, who speaks of their red hair, and their large limbs, denoting German extraction. At

what time the Goths of Scotland expelled the prior Celtic race, it would be as difficult as unprofitable to attempt to ascertain.

The Celts had been probably long expelled from the eastern coast before the arrival of Cæsar. The part of Scotland, called the Highlands, has been possessed by a Celtic population since the sixth century; but this was a reflux of the Celts from Ireland, not the remnant of the aboriginal race. The settlement of the Dalriads or Attacotii in Argyleshire, is fixed by antiquarians at the year 258. Their repulsion to Ireland took place in the fifth century; but, in the sixth century, they made another, and a permanent settlement. It has been indeed pretended by Boethius, Buchanan, and some Scottish antiquarians, who make high pretensions to antiquity, that the Celtic Scots reigned in Scotland 1000 years before the Christian æra; but that fabulous millennium is now justly given up.

The Britons, at the time of Cæsar's arrival, like the Gauls from whom they sprung, were divided into many petty kingdoms; in each of which there were subordinate chieftains, who respectively governed their own tribes. On extraordinary occasions, they united under a common leader; but this king of kings had but a short and limited rule; and their confederacies were neither numerous nor lasting. "There was one thing," says Tacitus, "which gave us an advantage over these powerful nations, that they never consulted together for the advantage of the whole. It was rare that even two or three of them united against the common enemy." By this means, as each of them fought separately, they were all successively subdued. Little is known of the limits of regal authority among the ancient Britons; but, if that power be changeable in its extent even in enlightened societies, how dependent must it have been on the personal character of the individual potentate among a people so rude! We have an instance of a father excluding a son who had offended him, from a share in his dominions; we have instances also of the public respect for hereditary right, and of its extending to female succession. From their similarity to the Gauls in other points, Dr Henry has conjectured, that the popular power was considerable; but this is merely conjecture. Whatever the royal or popular power might have been, the priestly influence must have been paramount to both, wherever Druidism existed. No public affair could be transacted without the sanction of the Druids: they could forgive malefactors, as well as sentence victims to the sacrifice: they could excommunicate individuals from attending the holy rites; a sentence as terrible in those times as under the Romish church. Their ceremonies were equally mysterious and inhuman. Mistleto, a plant produced on the branches of the oak, was gathered by them with every circumstance of awful solemnity. The priestly spoils and property were left in the centre of their consecrated woods, defended from the approach of the people by no guard, but their superstition. In the midst of these groves, they also sacrificed their prisoners and victims; and, from the course of the blood around the altars, foretold the course of future events. They were the

law-makers, the physicians, the poets, and philosophers, of their country. They taught their disciples the doctrine of transmigration, and inculcated the duty of despising death in defence of their native country. Britain was regarded by the Gauls themselves as the great sanctuary of Druidism.

Though the insular situation of Britain had early made its shores the resort of foreigners, yet the natives, as they were found by the Romans, had derived but little civilization from foreigners. Their clothing was harsh, untanned skins; the naked parts of their body were coloured, for the sake of ornament, with the smearings of an azure herb. Agriculture had, indeed, been introduced by the Belgic Gauls; but the general food was milk, and the flesh of their herds; for, even to those poor savages, superstition had forbid the use of fish, and several kinds of animal food. Their towns were a confused parcel of huts, covered with turf, boughs, or skins, and were placed without order or distinction of streets, in the midst of some wood or morass, the avenues to which were defended with ramparts of earth and felled trees. They were large, and tall in their persons. "The Britons," says Strabo, "excel the Gauls in stature, of which I had ocular demonstration; for I saw some young Britons at Rome, who were half a foot taller than the tallest men." The same author, however, who speaks of the size of those Britons whom he had seen, describes their shapes and features as clumsy, and says, that they did not stand firm on their legs. Though savages in point of art and industry, the ancient Britons are respectfully spoken of by several Roman historians, with regard to intellectual and moral character. Tacitus says, they possessed a quicker apprehension than the Gauls; and Diodorus Siculus prefers their honesty to that of the Romans. A custom very abhorrent to natural morality is indeed recorded of them, that they possessed wives in common to societies of 10 or 12 persons; but the supposition of such a custom might be easily assumed by a Roman stranger, from the very innocence of barbarians sleeping promiscuously in huts; although the chastity of the sexes might be as purely kept up as in states of society, where they are divided by greater ceremony.

Though the Phœnician and other merchants were probably early acquainted with the mainland* of Britain, yet their exports must have been inconsiderable before the Roman conquest, compared with the articles which were exported after that era. The exports, in the flourishing times of Roman trade, seem to have been copper, tin, lime, chalk, pearls, for the beauty of which our island was celebrated, corn, cattle, hides, horses, cheeses, dogs, and slaves, with the solitary manufacture of baskets.† Some of the most useful baser metals seem not to have been found in Britain before Cæsar's time, as he informs us that their brass was imported; and their skill in manufacturing those metals which they had, must have been, at the same period, very rude, since we find that their ornamental trinkets were supplied by strangers. Their martial habits, however, were not likely to leave them ignorant of the coarser craft of the armourer. Besides small targets and swords, which, as well as their spears, were supplied with a noisy rattle, intended to strike terror, they

used in battle, chariots, with iron scythes projecting from the axle. But though they managed these chariots with expertness, and could sometimes break even the Roman line with them, they were of little use, upon the whole, against disciplined troops, and were heard of no more after the Romans had gained a footing in the island. The Britons shaved all their beard except the upper lip, which, like the Gauls, they suffered to grow to great length. The fulness and beauty of the hair of the head was displayed as a mark of dignified birth.

Such were the inhabitants of this island, when Rome, in the plenitude of her republican glory, determined to add it to her empire, about 55 years before the Christian era. With no better pretext for hostility, than a rumour, that these islanders had lent some assistance to the Gauls, Cæsar dispatched Caius Volusenus with a galley, to gain intelligence about the shores, and the natives, whilst he collected a fleet upon the sea coasts about Calais and Boulogne. The Britons, learning his design, sent ambassadors, offering submission. Cæsar dismissed them, after a kind reception, with Comius, whom he constituted king of the Atrebatians; and whom he instructed to gain as strong a party as possible among the British states; and announced to the Britons, that he would soon visit their island in person. The Britons, seeing no hope in negotiation, imprisoned Comius, and raised an army for their defence. On the return of Volusenus, Cæsar embarked the infantry of two legions at a port, supposed to have been Calais, on board eighty transports, and ordered the cavalry of those legions to embark at another, eight miles distant, on board 18 transports. He sailed in person with the infantry transports, about one in the morning of the 26th August 55, A. C. and anchored off the coast of Britain, near Dover, about ten the same day. Perceiving, however, that the lofty cliffs were covered with a British army, he weighed anchor again at three in the afternoon, and, sailing eight miles farther, stopped at a plain and open shore, probably at or near Deal. At first the playing of the engines on board the galleys, which Cæsar sent to flank the opposing Britons, disconcerted their barbarous troops; but still the Romans were backward to encounter both the waves and the enemy, till the standard bearer of the 10th legion jumped into the sea, and called aloud upon his countrymen to follow their eagle, and support the glory of the commonwealth. After a bloody struggle, the Britons were repulsed. They sued for peace, and obtained it at the expense of submissions which they could easily retract, and a promise of hostages, who never arrived.

The Roman cavalry had sailed from Gaul the same day that this truce was concluded; but were driven back to the continent by a storm, which also destroyed many of the galleys and transports that had arrived.

The native chiefs, drawing hopes from this circumstance, retired from Cæsar's camp under various pretexts, and prepared to renew the war. While the 7th legion was gathering in the harvest, they were assaulted by surprise from the adjacent woods, by the British cavalry and chariots, and would have been cut in pieces, if Cæsar had not arrived with a reinforcement. Cæsar himself acknowledges, that he only put the Britons to

* We have no direct evidence of foreign merchants visiting the mainland of Britain before Cæsar's time, but only the Cassiterides, adjacent islands.

† *Barbara de Pictis veni bascauda Britannis. Martial.*

a stand. He kept his forces facing the enemy for a time, and then led them back to the camp. Upon the whole, by the victor's own account, the laurels which he gained in Britain, were both scanty and hardly earned.* Within a few days the Britons were emboldened to approach the Roman camp; they were repulsed, indeed, with great slaughter; but so far was the victory from securing even a corner of the island to its invaders, that peace was again granted, on condition of the British hostages being doubled. These hostages were to be sent after the conqueror into Gaul. After staying little more than three weeks, Cæsar embarked his whole army, and returned to Gaul.

At a much earlier period of the next year, Cæsar embarked from Calais to renew the invasion of Britain, with an army of five legions, and 2000 horse, on board a fleet of more than 800 ships. The sight of so prodigious a fleet, made the Britons despair of resisting his landing, which took place at the same spot as before. Leaving a small force behind him to defend his fleet, Cæsar pursued the Britons, and overtaking them, after twelve hours march, at a river (supposed to be the Stour,) where they attempted to oppose him, drove them before him. They made another attempt to defend themselves in a woody fastness; but their rude entrenchments were forced by the Romans, and they again retreated. Next morning, as the victors had come in sight of the British rear, accounts were brought of a storm, such as had happened in the preceding year, having damaged, and almost destroyed the Roman fleet. The pursuit was stopped till Cæsar had repaired to the coast, and secured his remaining ships in fortifications within the camp.

In the mean time, the British confederates had chosen Cassibelanus, king of the Cassi, for their commander in chief, and waited the return of the Romans, with confidence in themselves and their commander. Several skirmishes took place, in one of which they defeated two choice cohorts of the invaders; but in their next attack, after this slight victory, they were entirely routed, and Cassibelanus suffering Cæsar to pass the Thames, at a place supposed to be Conway Stakes, dismissed all his infantry, and retained only his 4000 war chariots, to watch and harass the Roman army. The British states, as Cæsar advanced, made their submissions, and gave him hostages and corn; thus facilitating his progress to the principal fastness of the British commander, which Cæsar forced, and took a great number of prisoners and cattle. Cassibelanus did not yet despair, but formed the bold design of cutting off Cæsar from his fleet, and sent orders to the leaders of the Cantii (the people of Kent), to fall upon the naval camp of the

Romans, which was not strongly guarded. Its defence, however, was sufficient to repulse the assailants; and the British leader, seeing no hope in further resistance, sought and obtained a peace from Cæsar, through the mediation of Comius the Atrebatian. Cassibelanus was bound to offer no injury to the British states, which had deserted his alliance for that of Rome. Britain was to give a tribute and hostages to the Romans, but neither the quantity or number is mentioned by Cæsar. At ten at night, on the 25th of September, 54 years A. C. Cæsar sailed with the last embarkation of his army from our coast; and for 97 years from that period, the Britains had no real disturbance, and but few alarms from foreign enemies.

Augustus only threatened them with invasion. He extorted presents and tributes from the princes, and derived a revenue from certain imposts on the mutual traffic between the island and the continent. In the mean time, the natives improved in civilization by their foreign connection, and the merchants of Italy settled in their towns. Tiberius exacted the same tribute, but lived on peaceable terms with them. Caligula's absurd visit to gather the cockle shells on the sea shore, does not deserve the name of an invasion; but in the reign of Claudius, an expedition was prepared in good earnest, with an army of 50,000 men, and Aulus Plautius at the head of it. At first the soldiers murmured at being sent, as they said, beyond the limits of the world; but at last were persuaded to embark, from confidence in their leader. Vespasian, the future emperor, had the second command in this enterprize, which was held so important in the eyes of the Romans, that every successive emperor had been predicted by his poets to be the conqueror of Britain.

Aulus Plautius landed unopposed, marched through the territories of the Cattivellauni,† gave three defeats to Caractacus and Togodumnus, the two British leaders; but still their retreating army seemed so formidable, that the Roman general sent for reinforcements, and invited the emperor to come over in person and finish the war; whilst he himself retreated to the south side of the Thames, and remained on the defensive. The reinforcements which Claudius brought, as may be easily imagined, soon altered the face of affairs; the southern part of the island submitted, and Aulus Plautius, from being general, was made governor of Britain. His lieutenant, Vespasian, reduced the Belgæ and Durotriges, from Kent to the land's end, after 30 battles. Plautius, with another division, waged war with the inland Britons under Caractacus, so successfully, that an oration was decreed to him at Rome, in which the emperor walked at his left hand to the capitol.

* That Cæsar gained not even much glory in his British invasion, appears from the testimony of several writers of his age. Lucan plainly taxes him with turning his back upon our countrymen:

Territa quæsitis ostendit terga Britannis.

Horace speaks of the Britons as unconquered in the days of Augustus:

*Intactus aut Britannus ut descenderet
Sacra catenatus via.*

Tibullus also:

Te manet invictus Romano Marte Britannus.

And Tacitus, in his life of Agricola, expressly says, that Cæsar only gave the Romans a view, not a possession of Britain:

Potest videri ostendisse posteris, non tradidisse.

† Inhabitants of Hertford, Bedford, and Bucks.

Ostorius Scapula succeeded in the provincial government of Britain in the year 50. The Britons had taken advantage of a short interval between his succession and the recall of Aulus Plautius, when the lieutenant-generals held a joint command, and had plundered the Roman allies; but Ostorius repelled them with great slaughter, and building a chain of forts along the Nen and the Severn, commanded all the natives within that pale to give up their arms. The Iceni,* though early allies of Rome, resisted this indignity, and would have been joined by other revolters, had not Ostorius defeated them in their entrenchments. With similar alacrity he overwhelmed the *Ceangi* near the Irish sea; then turning upon the Brigantes inhabiting Yorkshire, subdued them also once more to the Roman alliance.

In the mean time Caractacus, who had lost the most of his dominions, had not lost his character or influence among the tribes who had still arms and independence, but at the head of the Silures transferred the war to the mountains of Wales; and at a place which is supposed to be the confluence of the Colne and Thame, built a stone rampart on a hill commanding a river, dangerous to be forded, where he awaited the attack of the Romans. We are not to estimate this ancient patriot by his success. Neither his bravery, nor choice of position, nor the resolution of his followers, who took an oath to die or conquer before they were attacked by the Romans, could atone for the difference of arms and discipline between them and their opponents. The latter, after fording the river, formed the *testudo* or military shell over their heads with their shields, through which the missile weapons of the natives could not penetrate as they slowly advanced up the mountain. The rampart of loose stones was soon demolished, and when they closed with their heavy armour against the native ranks, they slaughtered them with scarcely the danger of receiving a wound. Caractacus took shelter, after the battle, with Cartismandua, queen of the Brigantes; but his inhuman step-mother delivered him in chains to the Romans, and the unfortunate hero was destined to enter the Roman capital as a captive, in the same procession with his brothers and wife and daughters, who had been taken at the fatal battle. On entering the imperial palace, the British prince calmly expressed his wonder, that the possessor of so much wealth should disturb him in his miserable cottages. The fame of a hero, who had for nine years resisted the Roman arms, was known throughout all Italy, and had attracted the curiosity of the emperor to see him. The barbarous monarch appeared undaunted before his throne, and addressed him with so much dignity, that even the stupid Claudius was affected, and ordering his fetters to be struck off, treated him and his family with distinguished regard.

The Silures beaten, but not yet subdued, rose upon some cohorts, who were building forts in their country, whom they cut to pieces, and once more risked a general engagement. They were defeated, but escaped without entire rout under cover of night. Continuing from that time their skirmishes and surprises, they gave Ostorius, after all his triumphs, so much vexation, that he died through mental anxiety.

Aulus Didius, his successor, checked the incursions of the Britons, after they had defeated a Roman legion, and become formidable under a new leader worthy of

succeeding Caractacus. This was Venusius, chieftain of the Huicci.† He had married Cartismandua, queen of the Brigantes; but that infamous woman had scandalised her subjects, by admitting Villocatus, her armour-bearer, to her bed and throne, and had implored the aid of the Romans, when the injured husband and his adherents turned their arms against the usurper. The event of the civil war was to drive the adulteress, the betrayer of Caractacus, from her kingdom, in spite of her Roman auxiliaries; and the invaders were, for several years, content to preserve, without extending, their conquests.

In the year 61, Paulinus Suetonius led the Roman army to the island of Mona, or Anglesey, the residence of the arch druid, and the asylum of all the enemies of the Roman power. He found an army drawn up in order of battle to receive him, whose appearance at first struck terror into his soldiers; for besides the armed men, there were women in funeral apparel, who, with lighted torches, ran along the ranks like furies; while woods, held sacred by superstition, and altars burning with fires, gave additional horrors to the scene, and multitudes of druids stood with uplifted hands, denouncing the vengeance of heaven on the approaching invaders of their mysteries. For a while the legions stood powerless, as marks to the arrows of the Britons; but at last encouraged by their officers, they rushed forward and put them to the sword, and after demolishing the altars and groves, burnt the druids in their own fires.

In Suetonius's absence, the states of the mainland, oppressed by the insufferable tyranny of their Roman masters, conspired for vengeance and deliverance. Prasutægus, the late king of the Iceni, had left the emperor joint heir with his daughters, in hopes of conciliating his protection; but the Roman officers and soldiers plundered the unhappy survivors; and when his widow Boadicea remonstrated, beat her with stripes, and violated her daughters before her eyes. Her whole kingdom was given up to plunder. The Trinobantes‡ had been at the same time stripped of their lands, and driven from their houses. Those enraged tribes broke in furiously upon the Roman colony at Camolodunum, and after laying it in ashes, destroyed all the infantry of the 9th legion. Suetonius, on his return to London, was implored by them to remain, and defend them against the insurgents; but he chose to march in quest of the enemy, who entered the place on his leaving it, and put all they found to the sword. In London, Verulamium, and other places, the carnage of the Romans and their confederates was computed at 70,000. Flushed by these successes, and joined by fresh associates, the British heroine gave battle to Suetonius; and dressed in her royal robes, with a spear in her hand, harangued her troops as she drove along their ranks in a lofty chariot, where her two unhappy daughters were seated at her feet. Her forces have been described as innumerable greater than we can suppose the country to have supported, or the Romans to have computed with certainty. Suetonius, with 10,000 men, waited their tumultuary attack in a position accessible only in front, and repulsed it with the usual success of the Romans. The Britons were entangled in their flight by waggons loaded with their wives and children, whom, the Roman historian says, they brought to be witnesses of their va-

* Inhabiting what is now Suffolk, Norfolk, Cambridge, and Huntingdon.

lour; but whom it is much more probable they placed there for want of a better asylum. After an immense slaughter of her army, the British queen ended her miseries by taking poison.

Broken as the British spirit must have been by so terrible a blow, it was kept alive, beyond its natural strength, by the torture of oppression. Suetonius, with all his abilities, was injudiciously vindictive. He was recalled from his post by Nero; and three successive governors after him being men of indolent characters, the Britons enjoyed peace for a few years. But under Vespasian, the Roman energies revived. The Brigantes, with their warlike leader Venusius, were overcome, and the Silures, in spite of their mountainous country, and an obstinate resistance, were subdued. These successes paved the way for the entire subjugation of the island, under the ablest and best of all the Roman governors, Julius Agricola, who knew how to retain, with the humane policy of a statesman, what he had won by his bravery as a soldier. In his first campaign, Agricola quelled the Ordovici,* and completed the conquest of Anglesey, from which Suetonius had been recalled by the dreadful insurrection of Boadicea. He accomplished this latter enterprise even without the aid of ships, selecting the best swimmers from his army, who passed the narrowest part of the channel with their horses and arms, but without baggage. In his second campaign, he carried his arms to the north, and subdued nations who never yet submitted to the Romans. Wherever he marched, he shewed clemency to the submissive; and, to secure his conquests, built a chain of fortresses from sea to sea, in or near the track where Hadrian's rampart, and Severus's wall, were afterwards erected.

In his third campaign, he traversed the country of the Caledonians (hitherto unknown) as far as the Tay, without meeting an enemy in the field. The Caledonians, expecting that their invaders would retire in winter, abstained from hostility; but when winter set in, they were disappointed, for they found the troops of Agricola settled in well-stored and fortified quarters, in which they could neither surprise nor besiege them. In the next year of his government, Agricola built a line of forts between the friths of Forth and Clyde; thus excluding, from all the valuable part of Britain, both the contagion of revolt, and from those barbarous inroads which might disturb its peaceable inhabitants. In his fifth year, he crossed the frith of Clyde; and after some successful skirmishes with the ancient natives of Cantyre, Lorn, Argyleshire, and Lochaber, had a distinct view of the coasts of Ireland, and meditated a design, which he never fulfilled, of adding that island to the Roman empire.

In the 6th year of his government, he set out on the eastern coast of Caledonia with an army, and a fleet so near it as to attend and support all its motions. He was opposed by an army of the Caledonians, who, in a night attack upon a portion of his army, threw it into confusion, and having entered the camp of the 9th legion, would have put them to the slaughter, if Agricola had not come up with great celerity to their aid, and driven the Caledonians to their woods and morasses.

Agricola retired, after this action, into winter quarters, and left the Caledonians a short time to prepare for the last struggle, in defence of their independence. When he took the field the seventh time, he found our

ancestors encamped on the skirts of the Grampian hills to the number of 30,000, under a warlike leader, Galgacus. The Roman army was little inferior in numbers. Tacitus has employed an eloquence and minuteness in describing this engagement, which would suit a more equal contest. So inferior were the armour and discipline of the Caledonians, that 10,000 of them were slaughtered, while the Romans lost only 340 men. Their missile weapons were, in fact, their only means of offence; their long broad swords being unfit for close action, and their bodies defended by only small targets. After the rout of their main body, a reserve of the Caledonians attempted to take the Romans in flank, but a Roman body, under Agricola in person, foiled this attempt, and the straggling bands of their whole army fled so fast and so far from the scene of action, that next day Agricola's scouts could not discover an enemy or inhabitant over the whole face of the country. A mournful silence reigned in every direction; and nothing was to be seen but the burning of houses, to which the natives themselves had set fire in despair. Agricola proceeded no farther northward, but marched into the country now called Angus, and received hostages from the Horesti. He gave orders to his fleet to sail along the eastern coast to the very northern extremity of Caledonia, and turning its extreme peninsula, to come round westward the whole course of the island, into the harbour from which they had sailed in the spring. His orders were performed, and even the perilous Orcades were subdued. After seven years service in Britain, of unexampled utility to his country, Agricola was recalled. In estimating his character, we are not to found his merit solely on the victories he obtained over naked barbarians. The ascendant which he gave to the Romans over the British mind, was obtained by means more creditable than the sword. He made the provincial Britons emulous of arts and improvements; and, acquainted with the comforts of civilized life, taught the youth of their nobility the language and the sciences of Rome, encouraged ornamental as well as useful public works, the splendid temple as well as the powerful garrison. Thus converting the whole national energy from warlike to peaceable objects, he was all the benefactor to Britain that a conqueror could be. But unhappily a people, who are helped forward to civilization, not by their own strength but by that of others, cannot reap from it its most ennobling effects. Hence, in place of their barbarous energies, was substituted that pliant spirit, which made them cling in supplication round the knees of Rome for protection, when she herself was falling.

From the entire conquest of Britain to the close of the third century, the island is seldom noticed by Roman historians. It was indeed visited by the emperor Adrian in the year 121, who, either from choice or necessity, abandoned the northern extremity of the province, and built a new rampart, from the Solway to the Tyne, many miles to the southward of that raised by Agricola. In 210, the Emperor Severus found it necessary to come to Britain, and repel the incursions of the Caledonii and the Meatae. He succeeded; and, having cleared the frontier, erected a stone wall, almost parallel with that of Adrian, on a system so permanent, that the foundations are to this day to be seen; abandoning Agricola's rampart, which had been repaired by order of the Emperor Antoninus Pius. Severus died at York in the year

* The inhabitants of present North Wales.

211, leaving his sons, Geta and Caracalla, joint successors in the empire. Caracalla concluding a peace with the Caledonians, hastened with his brother to Rome, to plunge into all the debaucheries of his capital; and, for more than seventy years from the time of his departure, the silence of historians may leave us room to hope that there was peace in the island.

In the reign of Dioclesian, Carnusius, an active naval officer, having been entrusted with the command of a powerful armament against the swarms of Saxon pirates who infested the coast of Britain, usurped the purple, and reigned for eight years in Britain with vigour and success; for he not only defended her shores from invasion, but even enlarged the limits of the Roman province, and repaired the wall of Agricola between the Forth and Clyde. At length Constantius, the coadjutor of Dioclesian, preparing to attack Carnusius, was assassinated by his false friend and general Allectus, who immediately assumed the purple and the sovereignty of Britain, and, by means of his naval superiority, maintained it for three years. In 296, Constantius, and his prefect Asclepiodatus, put an end to the rebellion, by defeating and slaying the usurper, after the imperial fleet had narrowly escaped that of Allectus off the isle of Wight by favour of a fog. Constantius, whose character was respectable, was received in Britain rather as a friend than a conqueror. His army had, indeed, essentially served the islanders, by preventing London from being plundered by the Saxon and Gaulish fugitives from the discomfited army of Allectus. In the division of the empire between Constantius and Galerius, Britain fell to the former: he resided in the island, and had some contests with the Caledonians, of which the particulars are not known. On his return from the north he died at York, leaving Constantine the Great his successor in the empire. When that prince introduced Christianity into the empire, Britain was not the last to embrace it. Constantine, who had begun his reign at York, staid some time to pay the last honours to his father's ashes, and to finish the war with the Meatae and Caledonians, who at this time began to be called by the new names of Picts and Scots.

In 354, Britain, which had taken part with Magnentius, an unsuccessful usurper, suffered bitter retribution from the Emperor Constantius, under his secretary Paulus, a Spaniard, who was sent as an inquisitor to the island, to discover those who were concerned in the rebellion. This wretch, who was surnamed Catena, or the chain, from his adroitness in connecting criminal charges, filled the whole western empire with tortures, murders, and confiscations. Martinus, the British governor, unable to restrain his cruelties, authorised as they were by supreme authority, attempted to slay him, but, missing his aim, he turned his sword against his own bosom. When Julian ascended the imperial throne, one of his acts of justice was to order the inhuman Paulus to be burnt alive.

The Roman province in South Britain had suffered but little disturbance from the northern nations for about 150 years; but, about ten years after their deliverance from Paulus, the Scots and Picts, notwithstanding a temporary check which they had received from the commanders of Julian, returned with greater force against the legions of Valentinian and Valens, and ravaged the country for three years with impunity. Theodosius, a British governor, of consummate abilities, was appointed to repair the disasters of the Roman arms. He recover-

ed London from the Barbarians, and even extended the province to its utmost ancient limits, the rampart of Agricola. The son of this distinguished commander, inheriting his father's talents, was adopted as partner in the empire, by Gratian, the son of Valentinian. Unwisely for themselves, and forgetful of what they owed to the memory of Theodosius, the Britons took part with the usurper Maximus. Maximus was accompanied into Gaul by myriads of Britons; but his enterprize miscarried, and his discomfited soldiers, after having made good their retreat to Armorica, settled there, through despair of ever regaining their native land. Theodosius finally triumphed over all his competitors, and by sending his vicar Chrysantus with an army into Britain, secured it from the ravages of the north.

After the death of this great man, an inundation of barbarians poured in upon all sides of the western empire, and, among these, the Picts and Scots fell upon Southern Britain. Stilico, the guardian of the young Emperor Honorius, sent over forces, who repulsed the barbarians in victories which are celebrated by the poet Claudian. But, as the Roman empire was now hastening to dissolution, its weakness, like a mortal disease in the body, was chiefly felt at the extremities. The Roman legions in Britain mutinied, and, with equal levity and insolence, set up successively and dethroned several usurpers. The distresses of Honorius obliging him to recal his troops, the island was left defenceless to the northern hordes. Honorius even gave up all claims to the allegiance of the Britons, and exhorted them to defend themselves. For a short time the few Roman veterans, who had settled and still lingered in the lands which belonged to them, gave example and assistance to the natives; but, as these gradually disposed of their estates, and retired to the continent, the multitude became an easy prey. Honorius, upon a favourable turn of his fortunes, sent twice over the aid of a Roman legion, which was sufficient to drive the northern tribes beyond their friths. Gallio of Ravenna, one of the last ornaments of Roman history, commanded the last detachment which Rome ever sent to our island. After repelling the savages, he convened the chiefs of the islanders, and told them with frankness, that, since the empire could afford them no future assistance, they must themselves assume courage to defend all that was dear to them. The repairing Severus's wall, the erection of useful forts, and supplying them with military weapons and engines,—these were the last good offices which the Britons received from their protectors, before they took their final departure, at the distance of 475 years from the landing of Julius Cæsar.

But the Britons, as incapable of exerting self-defence as of enjoying liberty, reaped no advantage from these bequests. So little had they profited by the instructions of the Romans, that they knew not how to retrieve each other, fatigue by the change of sentinels upon their ramparts. "They fell asleep, (says Gildas,) upon their posts, and were dragged off the battlements by the hooks of the barbarians. The Scots and Picts broke over their walls like wolves into a sheep-fold, retired with their booty, and returned every succeeding year. Instead of resisting them, the British states, divided among petty tyrants, turned their feeble arms against each other, till a famine, which was succeeded by a pestilence, threatened depopulation to the whole southern part of the island. In 446, the fame of Ætius, the Roman prefect in Gaul, afforded a forlorn hope of assistance from the

Roman arms. Ætius was addressed in a letter, entitled, the groans of the Britons to the thrice appointed Ætius. "The barbarians," (said they,) "drive us into the sea, and the sea drives us back upon the swords of the barbarians." Ætius might pity the suppliants, but could spare them no assistance, employed as he was in opposing Attila, king of the Huns.

Despairing of all power to resist their northern invaders, the Britons applied, (it is said) for assistance to the Saxons, a people inhabiting that peninsula, called the Cimbric Chersonesus, which is bounded by the Elbe on the south, by the German ocean on the west, and by the Baltic sea on the north and east. The tribes of this nation had been hitherto known to the Britons only by visits of depredation to their coasts. It is said by the Saxon historians, that the states of the island were convened, and that by the advice of Vortigern, prince of the Silures, the fatal resolution was adopted, of offering their country and their liberties to the Saxons, if they would defend them against the Picts and Scots. That the spirit of the Britons was sufficiently humble to apply to the Romans, in the terms that have been described, may easily be conceived: they knew the value of Roman protection, and the Romans were a civilized people; but that they besought the Saxons, a pagan race, known to them only by their ferocity, to accept of their liberties and properties, and that they laid themselves at once at their mercy, in beseeching them for their aid, is a thing so improbable, that the partial authority of the Saxon authors is insufficient to confirm it. It is at variance with human nature, and with that immediate resistance to the Saxons, which the Britons immediately made when they began to seize upon their possessions. We may therefore suppose the first visit of the Saxons to have been accidental, or, if they came invited, that it was only by a small portion of the natives who took them into their pay. The Saxon ships, which we cannot suppose to have conveyed more than a few hundred men, arrived on the British coast in 449. The leaders of the troops were Hengist and Horsa, the fabled descendants of Woden. By their aid the Picts and Scots were defeated; but the Saxons, glad to settle in the fertile fields of a delightful island, in exchange for the bleak shores of the Baltic, invited over fresh reinforcements of their countrymen, and, from the auxiliaries, became the masters of the natives. The Britons exerting, when it was too late, a valour that had been dormant, or wasted itself in civil war, opposed their new tyrants occasionally with success. In one of their battles with the Saxons, the chieftain Horsa fell. His brother, Hengist, in spite of all his victories, so much boasted by the Saxon annalists, does not appear to have penetrated beyond Kent. By degrees, however, the Saxon power reduced the natives either to entire submission, or drove those who retained independence to the mountains of Wales, of Cornwall, and Cumberland. This was effected a considerable time before the reign of King Robert.*

The proper history of Britain as one kingdom, does not commence till the beginning of the seventeenth century. In 1603, James the Sixth of Scotland, and First of England, succeeded to the throne of Elizabeth. He was the great-grandson of Margaret, eldest daughter of Henry VII.; and his right to the crown was farther strengthened by the act of Parliament, which had settled

the succession on the heirs of Henry VII. by the dying bequest of Elizabeth. As the memory of disputed succession was yet fresh in the minds of the English, the joy of the nation at James's accession was very great. A Protestant and undisputed successor, and a sovereign who was to extinguish the hostilities of Scotland, seemed to be a golden era in the public welfare.

But the popularity of James hardly survived his arrival in England. The people, who had crowded around him with shouts and acclamations of happiness, were forbidden, by the pride or timidity of the monarch, to shew their loyalty in this noisy manner, and in a short time it became unnecessary to forbid them. He disgusted the English, by heaping favours on unpopular families, and by multiplying the Scots as well as English new nobility. A conspiracy, which, though obscurely developed, was certainly detected in the first year of his reign, attests the discontent of some of the leading characters in the nation. The Lords Cobham and Gray de Wilton were connected with it, and it was made at a subsequent period the pretext for Raleigh's execution.

Of all those who had hoped for advantage from the accession of James, the puritans, a body of believers now important from their numbers, and destined to take a decisive share in the events of the subsequent reign, had been the most sanguine, and were the most disappointed. They imagined, that the king of a Presbyterian nation would be propitious to a similar church. But James, in his heart, detested presbytery, and gave an audience to the leaders of the puritans only for the pleasure of insulting them. In a conference which those dissenters held with the bishops at Hampton Court, he answered their chief objections himself, so much to the satisfaction of the dignified churchmen, that one of their number, Bishop Whitgift, said, he verily believed the king spoke by the spirit of God.

The first intercourse between James and his English parliament discovered at once the character of the new monarch, and the spirit of the people over whom he had come to reign. Vain, weak, accessible to flattery, arbitrary in principles, though not ferocious in disposition, James had unhappily found in his English ministers, Cecil, Suffolk, and Northampton, as devoted parasites as in Whitgift and the bishops. He addressed the parliament in terms which shewed that he believed himself an absolute king, whose proclamations were to be identified with laws. But it was only his courtiers and bishops who either believed, or affected to believe, him an absolute monarch, and the Solomon of the age. The House of Commons already contained a large proportion of free and intelligent spirits. The principles of independence, which had been upheld in that house, in some instances, against the power of the great Elizabeth, were not likely to be veiled before the mock dignity of James. His first parliament therefore, reminded him of their privileges; they resisted the encroachment of his chancellor issuing new writs for elections, without an order of parliament after the knight of a county had been duly elected; and they made some laudable attempts, which their successors brought to a conclusion, to emancipate the trade and manufactures of the kingdom from monopolies, as well as the landed interest from some relics of feudal oppression.†

James's accession to the English throne was quickly followed by the conclusion of peace with Spain. A pacific disposition is one of the good parts of James's cha-

† Particularly lordships and purveyance.

racter, which has been too little allowed. But while the nation was enjoying the first return of peace, a more dreadful blow was meditated against the government in all its branches, and against the religion of the country, than any that is recorded in our history. This was the Gunpowder Plot; for the detailed particulars of which, we must refer the readers to some subsequent pages of our work.* The fears of gunpowder, which were naturally present to James's mind by the recollection of his father's death, happily suggested to him the meaning of threats contained in a letter from one of the conspirators, which had eluded the sagacity of his wisest counsellors. The common danger which the king and parliament had escaped, seems for a while to have cemented them in good humour; and we find a supply, estimated at 400,000*l.*, a most important sum in those days, voted by the commons to relieve the king, when his want of economy and expensive establishment had reduced him to difficulties, in giving a splendid reception to his brother-in-law, the King of Denmark.

In a most important discussion, which occupied the attention of James's first parliament, it is somewhat surprising to find the king eager in forwarding a measure which reflects credit on his sagacity, and opposed on the part of his parliament by the most groundless fears, or still more contemptible national prejudices—this was the union of the two kingdoms. Sir Francis Bacon, the king's solicitor, moved it, and supported it with the usual powers of his great mind. He maintained, that for this desirable measure, no uniformity was necessary in the laws or religion of the two people; but that the English monarchy would become truly formidable, with Ireland subdued, Scotland united, and the navy supported. The commons were inflexible. But from the judges a declaration was obtained, which, though inferior in force to a law, was of some importance. The *post nati*, that is, all Britons born since the death of Elizabeth, were declared to be naturalized in either kingdom.

James's pecuniary difficulties, incurred partly by his expences in maintaining his government in Ireland, but still more by his unnecessary profusion, brought him to solicit his first parliament for another supply. They, in turn, demanded redress of national grievances, and among these the suppression of the High Commission, an ecclesiastical court, which had begun to act with severity against the puritans. The dispute terminated in the dissolution of the parliament, after James had told them "not to meddle with the main points of government, that was his craft; nor to pretend to instruct a king, who had been thirty years at the trade in Scotland, besides an apprenticeship of seven years in England."

In 1613, James found it necessary for the sake of relieving his wants, to convoke another parliament. His affections had already been fixed upon a worthless favourite, Robert Carr, whom he had raised through several gradations of dignity to be Earl of Somerset. The sums which he spent on this minion, and the countenance which he shewed to him after the horrible tragedy of Sir Thomas Overbury's murder,† degraded the monarch in the eyes of his people, and aggravated the distresses of his Exchequer. His second parliament was still more refractory than the first. At their first meeting, the king proposed a supply to be granted, and then to pro-

ceed to redress of grievances; but the commons reversed the business, and began with redress of grievances. The king in wrath dismissed them, and imprisoned some of the members, who had chiefly distinguished themselves in resisting the supply—a proceeding which, as Lord Coke remarks, was the greatest violence ever done by an English monarch to the constitution.

James revisited his native kingdom in 1616, received the homage of her poets in a dead language, and made speeches full of puns to the members of her universities. Before his accession to the throne of England, he had indirectly, but unsuccessfully, attempted the restoration of the hierarchy in the church of Scotland. But although the Scottish bishops had been permitted to retain their temporal dignities, and a proportion of their revenue, the spoils of the ancient church were engrossed by the nobles, and those titular bishops could not resist the authority of the national presbytery. To this church James was a determined, though for some time an hypocritical enemy. He began his attack upon it by discontinuing the General Assembly, and banished those clergymen who had the spirit to remonstrate. By the royal influence, a decree of the Scottish parliament was obtained, which restored thirteen bishopricks; and, by an illegal meeting held among the subservient part of the Scottish clergy, the bishops were appointed perpetual moderators within their own presbyteries. To complete the degradation of the people, a High Commission was put in the hands of the prelates, by which they enjoyed inquisitorial powers of citing and punishing at discretion, laymen as well as clergy, for religious opinions. The vengeance of the Scots due to James for thus trampling on their religious rights, fell not upon him but his successor. It seems as if the public hatred, excited by these proceedings, had been smothered during the king's visit by the more loyal feeling of joy at the sight of their ancient monarch.

After his departure, an attempt was made to enforce the observation of a ritual in worship similar to the English. The people were admonished by proclamation, to observe the festivals, and the clergy to practise the formalities prescribed to the church. But the Scots persisted, at Christmas, in their usual occupation. In the churches, they left the sacramental tables when required to kneel, and went in crowds to other places, where the orthodox form of sitting was preserved. A people, as a spirited historian‡ observes, who prayed to God standing, were not likely to kneel to sacramental symbols.

The execution of Sir Walter Raleigh is one of the most unjustifiable acts of James's reign. It is probable, as Hume has asserted, that Raleigh was culpable in making the factitious gold mine in New Spain a cloak for his real intentions of plundering the Spanish settlements; but, if that fact admitted of so easy a proof as Mr Hume supposes, Raleigh ought to have been punished on that account, and on no other. An English jury, it is said, would not have brought him in guilty. If so, the sacrifice of the bravest living commander was a detestable action, even though done for the sake of prolonging peace with Spain.

But James's pacific views with regard to Spain had not entirely the merit of public advantage, they were mixed with private and selfish considerations. He me-

† Though Somerset retired from Court, James bestowed a pension on him.

‡ Laing.

dictated a marriage between Prince Charles and the second daughter of Spain; with whom he expected a very large dowry. When Frederic, the Elector Palatine, who had married the daughter of James, accepted of the crown of Bohemia, the weak father-in-law would neither break with Spain, nor had he prudence to resist, in a proper manner, the voice of his people, who called upon him to plunge into war in defence of the oppressed Bohemians, and of the Protestant cause. A new parliament being summoned, the commons voted considerable supplies, on being informed that the king had remitted some money to his son-in-law the elector; and proceeding in the most temperate manner to the examination of grievances, they represented several, which were redressed with alacrity. But the delicate business of research into abuses,* necessarily produced a difference of pretensions on the yet unsettled boundaries of the constitution. He dismissed the parliament after a short session, and parted with them on worse terms than he had met them; forfeiting the little popularity he had gained, from some limitations of his prerogative, by imprisoning Sir Edward Sandys for his opposition in the late session.

Before the next meeting of parliament, the Upper Palatinate had been subdued by the emperor's generals, Frederic was a fugitive in distress, and all Germany was filled with the cruelties inflicted on the Protestants. Roused by these circumstances, the commons exhorted James to abandon the intended match with Spain, and take arms for his son-in-law and the Protestant cause. However impolitic it might have justly seemed to embark in a religious war, yet a respectful and reasonable answer was certainly due to the serious appeal of the people in such circumstances. But instead of reasoning with his commons, James rebuked them for presuming to address him on the subject. When the commons rejoined to this rebuke, he gravely told them, that their capacities and understandings were not able to comprehend his measures, and reminded them of the proverb, that "the cobbler should stick to his last." The rights of parliament, he concluded by saying, were not hereditary or inherent, but held by the grant and toleration of himself and his predecessors. The commons replied to this abusive and weak declaration, by a memorable document of English freedom, in which they recorded the right of parliament to advise the king in all arduous matters of government, to redress public grievances; and maintained the right of each individual in parliament to the freedom of speech in debate. James, with his own hand, tore out this protestation from the journals of the commons; and, having dissolved the parliament, imprisoned Seldon, Pym, Coke, and other eminent patriots. This parliament was remarkable for a spirited opposition in the peers; where, although the king had a predominant party, the Earls of Oxford, Essex, Southampton, and Warwick, and the Lords Sax, Selle, and Spenser, eminently distinguished themselves by maintaining resistance to an arbitrary court.

Unsupported by his parliament, James maintained a despised and feeble negotiation for his son-in-law; nor was he discouraged from it, even when the diet of Ra-

tisbon, in spite of the remonstrances of all the Protestant powers in Germany, transferred the electoral dignity from the palatine Frederic to the duke of Bavaria. Two armies, that fought for Frederic in Germany, were defeated by the Austrian count Tilly, when James persuaded the palatine to disarm; the third army, at the head of which the famous count Mansfeldt, with the scantiest supplies of money from the palatine and the king of Britain, had supported an unequal contest with Austria. It was not from treating with the emperor, that James expected redress to his son-in-law, but from the mediation of Spain, in the event of his son's marriage with the infanta.† At the end of five years negotiation on that subject, the court of Spain was as lavish of promises as ever; but had not removed the great pretended obstacle of a difference in religion, by obtaining what might have soon been obtained, a dispensation from the Pope. To bring the business to a close, Digby (soon after earl of Bristol) was dispatched to Philip IV., and one Gage was sent secretly as an agent to Rome. To render the influence of the latter more effectual with the pope, writs were issued under the great seal, to release all Catholic recusants in England from prison; and it was daily expected that the execution of all penal laws against the professors of that religion would be stopt by royal authority. As a humane act of toleration, this edict offended the bigots of that period as an illegal stretch of prerogative; however humane in the object, it alarmed the best friends of liberty. These writs were contrary to the law, to the remonstrance of the commons, even to concessions made by the king himself, and, in a general view, to the acknowledged principles of the constitution. They raised a strong commotion in the public mind, which James vainly endeavoured to assuage, by a publication in writing, beginning with the following comparison: "As the sun in the firmament appears to us no bigger than a platter, and the stars but as so many nails in the pommel of a saddle, because of the enlargement and disproportion between our eye and the object; so there is such an immeasurable distance between the deep resolution of a prince, and the shallow apprehensions of common and ordinary people, that as they will ever be judging and censuring, so they must needs be obnoxious to error and mistaking." Without convincing his subjects by the arguments which followed this sublime comparison, the king found, to his joy and triumph, that the court of Spain, after so long amusing him, seemed at last to be sincere in the projected marriage. His concessions to the Catholics at home, and his promise of toleration to the followers of the Spanish princess, when she should come to England, excited the hopes of Spain that her favourite religion would yet revive in the bosom of England. Lord Bristol himself, who had formerly opposed the Spanish match, considered it as an infallible prognostic of the palatine's restoration; nor, indeed, was it easy to conjecture why Philip should be ready to bestow his sister with a dowry of 600,000*l.* sterling on a prince, whose demands he meant to refuse at the hazard of a war, unless we suppose that he counted on the cowardice and facility of James's temper.

* It was by this parliament that the great Bacon was impeached for corruption.

† The king's project was to get the infanta's dowry first, and then to demand restitution of the Palatinate, lest that restitution should be held out as a compensation for the dowry. Lord Digby's instructions were, "not to make the affair of the Palatinate one of the marriage articles." But the public were taught to believe, that the recovery of the Palatinate was one of the king's chief motives for pushing the marriage.

But while the king was exulting in the expected fruits of his pacific wisdom, they were blasted by the interference of a worthless favourite. This was Villiers, duke of Buckingham, who had succeeded to Somerset in the capricious affections of James, and had risen from the rank of his cup-bearer to a dukedom and the first dignities of the state. Equally worthless with Somerset, he had captivated the sovereign by the same external beauty and superficial accomplishments; but he had governed both the king and the court more intolerably. From the mediocrity of his talents, he was unfit to give weight to foreign transactions; and by his insolence, he had become odious to many at home. Yet wishing to regain his influence by foreign distinction, and envying the earl of Bristol the reputation he had acquired by managing the Spanish negotiation, he persuaded prince Charles to the romantic resolution of going in person to Spain, that he might throw himself at the feet of the Spanish princess, and claim her as his bride in the true spirit of knight errantry. The prince and Buckingham, (or baby Charles and Stanny, as the king used ridiculously to call his son and his favourite,) were received at Madrid with all possible courtesy, and the match, after many delays, seemed on the point of being consummated, when it was broken off on the side of the prince. This is ascribed to the influence of Buckingham, who is said to have quarrelled with the Spanish nobility, and to have hated the Infanta; but we must also take into account, that Charles had seen at Paris, on his way to Spain, Henrietta, the daughter of Henry IV., and for her he conceived a passion, to which he continued faithful all his life. The match with the homely Infanta was broken off, and a war between the two countries appeared inevitable.

To meet the consequences of the broken treaty, a parliament was called. Buckingham, in the peers, publicly laid the blame of the rupture on the insincerity of Spain with regard to the match, and appealing to the prince of Wales, at the end of every solemn assertion, received a sign or word of assent. It might have required but little penetration to discover, that this was a collusion in falsehood between the prince and the favourite; but the idea of a Spanish war was so popular, and the joy so great at the breach of a Catholic alliance, that Buckingham for a time grew popular, and was hailed, even by sir Edward Coke, as the saviour of the nation.

James lamented to his parliament, that, after having borne so long the name of the Pacific Monarch, he should be plunged into war in his old age. He demanded supplies to meet the event, but offered that the war funds should be managed by a committee appointed by parliament. The commons took him at his word, with respect to the management of money, but voted a smaller sum than he had demanded. Availing themselves too, of the more submissive character which he began to discover in his old age, they corroborated their power of impeachment, and obtained a declaratory act against monopolies.

Troubled at the prospect of war, the king now longed for the arrival of the earl of Bristol, an enlightened statesman, who had managed his interests at the court of Spain with great fidelity and intelligence. But Buckingham was conscious of the falsehoods he had told respecting the Spanish treaty, and sensible that Bristol could expose them. From the absurd weakness of his master, he obtained an order for Bristol's commitment to the Tower; and though he was soon released, he

was ordered to retire to his country seat, and to be absent from parliament. Prince Charles and Buckingham had the meanness and tyranny to offer him the king's favour, if he would acknowledge his conduct to have been wrong, an offer at which he spurned with proper spirit; but though the king expressed his opinion of his treatment being unjust, he had now no will of his own, and could never obtain an interview with Bristol.

The United Provinces were at this time governed by prince Maurice, who, on the breaking of the truce with Spain in 1621, took the field against the celebrated Spinnola; but the force of the latter was so much stronger, that Maurice was obliged to act on the defensive. A reinforcement of six thousand men, who were now expected from England, under the young lords Oxford, Southampton, Essex, and Willoughby, promised an important accession to his strength. It was determined also to reconquer the Palatinate, a state in the heart of hostile Germany, and cut off from all communication with England. Count Mansfeldt was taken into pay, and twelve thousand Englishmen were levied by press throughout the kingdom, whose bravery, it was hoped, would penetrate the whole continent, and restore Ferdinand to his throne.

France did not behold with indifference the extended encroachments of the house of Austria, nor, without satisfaction, the combination of England and her ally to oppose them. But the first project of Louis and Richelieu was to humble the Hugonots. The proposal of a marriage, however, between prince Charles and the princess Henrietta, was favourably received on the part of France. The same terms as to Catholic toleration were agreed to by the English court, which had been promised in the negotiation for the Infanta, and the new treaty was signed at Paris on the 16th of November 1624. The marriage portion promised by Henrietta was 800,000 crowns; and it was stipulated, that the prince should settle a jointure of 60,000 crowns a year. Fatally for the house of Stuart, the French princess was to have the education of the children till thirteen years of age.

During the whole negotiation, promises had been made, (though in general terms,) that the English troops should have a passage through France, and even be joined by succours for the Palatinate; yet when Mansfeldt's troops sailed to Calais, no orders had arrived for their admission. They sailed to Zealand, but the States had some scruples to admit them, on account of the scarcity of provisions. A distemper in the mean time broke out in the fleet, which carried off one half of the forces, and as the rest were too few to think of reaching the palatinate, the expedition was given up. James, however, did not live long to witness a state of affairs so foreign to his pacific dispositions. About the middle of March he was seized with a tertian ague, and though such a disorder was not thought dangerous in the spring, he died on the 27th of March, in the 59th year of his age, after a reign over England of 22 years. His reign over Scotland was almost of equal duration with his life.

James, the son of queen Mary and lord Darnley, the handsomest couple of their age, was homely in his person and ungainly in his manners. He possessed learning, and some ingenuity of speculation in moral and general subjects, but neither his judgment nor morals were of a high cast. Without the dignified reserve which should accompany a proud king, or the art of condescension which makes affability popular, he blend-

ed a vulgar stateliness and a familiarity, so incongruously together, that during his whole reign he reminds us more of some mock king in a farce, than of a real one on the theatre of history. His pretensions to arbitrary power, whilst he had not a regiment of guards to enforce them, betray such ignorance of human nature, and so much of the vulgar and childish notion of kingly right, that they lose all resemblance to lofty and imposing ambition.

The colonization of North America, is the most memorable circumstance in the history of James's reign. Elizabeth had done little more than given a name to Virginia: the feeble colony which she planted was abandoned entirely. Even after Argal had discovered a more direct track to that continent, and after a new colony had been settled in James's reign, there were not alive more than 400 colonists in 1614. But by the culture of tobacco they soon acquired wealth, and extended their numbers to other places.

Charles I. succeeded to the same favourite, the same ministers, and council, which his father had possessed, and unhappily inherited the same principles in government. It was not improbable if James had lived, that Buckingham whose influence had for some time fastened rather on the weakness than on the affections of the old king, would have been dismissed; but his power was established by the ascension of Charles, at the time when his temporary popularity, obtained by the rupture with Spain, began to decline, or rather was changed into the most inveterate dislike on the part of the nation.

The marriage treaty with France had been concluded in James's lifetime. It was solemnized at Paris with great magnificence, where the Duke of Chevreuse performed the part of proxy for the king of England. Buckingham was sent over to France to conduct the queen home. She arrived at Dover on the 12th of June, and the marriage was consummated next day at Canterbury. On the 16th, their Majesties entered into London; and the new parliament met next day. Charles inherited a scanty treasury and revenues, which had been inadequate even to support a peace establishment. The war, though produced by a freak of his own or of Buckingham's, had been sanctioned by the voice of the nation and of the parliament. The new parliament itself, chiefly composed of Puritans, never pretended to advise pacific measures, and must have been conscious that the king could neither recede from war with honour, nor prosecute it with advantage, without their advice and assistance. To support this war, for which the nation had clamoured for so many years, to enable Charles to wrest the Palatinate from the victorious Ferdinand and the mighty armies of Austria, and to cope with Spain, the richest monarchy in Europe, they gave to his earnest intreaties a supply of 112,000 pounds. The excuses that have been alleged for this insulting parsimony, are the public hatred at Buckingham, and the discovery of the war having been produced by the artifices of that favourite. This apology is insufficient: if the war was found impolitic or unnecessary, the commons should have openly told the king to abandon it. If it was necessary, they ought not to have avenged themselves for a lesser grievance, by inflicting upon the nation a greater.

Charles was obliged, by reason of the plague, to adjourn the parliament for a few weeks in the summer, but he re-assembled them at Oxford, and implored them to assist his necessities. Besides his German warfare, he had a subsidy to pay to his ally the king of Denmark;

and, independent of debts contracted by himself and his father, the expenses of the war, including the defence of Ireland, amounted annually to a million and one hundred thousand pounds. Though a fleet and army were lying at Portsmouth in want of pay and provisions, the commons refused further aid. James had before his death, promised to lend the king of France one ship of war and seven armed vessels. They were borrowed on pretence of being employed against the Genoese, who, as the allies of Spain, were sufficiently odious to the English to make such an use of them popular. Louis afterwards persuaded Charles to be allowed to employ them as he pleased, and they were sent under vice-admiral Pennington to Dieppe, to assist against the Hugonots. Pennington being himself unwilling for the service, gave way to the resolution of his crews not to serve against protestants. On returning to the Downs, he was persuaded again to sail for France, on pretence that the French king had made peace with the Hugonots; but the fleet finding themselves deceived, deserted him. When the news reached the commons at Oxford, they applauded the conduct of the sailors, forgetting that if they meant to be at war with Spain, they were fighting the battles of that power, by assisting the Hugonots, who were in secret alliance with his Catholic majesty. They renewed their clamours against popery, demanded the punishment of Catholics for assembling to celebrate the rites of their religion, and remonstrated against some pardons lately granted to priests, who had been convicted of that offence. They also enacted laws for the stricter observance of the Sabbath, (as it was now puritanically called,) and petitioned the king for replacing such able clergymen as had been silenced for want of conformity to the church. The king availed himself of the appearance of the plague at Oxford, to dismiss a parliament, who gave him nothing but complaints, and by dissolving, instead of proroguing them, he marked his displeasure at their conduct.

By issuing privy seals for borrowing money, the king was enabled to equip a fleet of 80 ships, with an army of 10,000 men. Cecil, Lord Wimbleton, sailed with these to Cadiz; but either finding it impossible, or neglecting to attack the valuable ships of the Spaniards in that harbour, he only landed the army. After storming a fort, where they found a store of wine, the men got intoxicated, and were obliged to be rebarked. They would have proceeded to intercept the Spanish galleons on their way to Spain, but the plague breaking out on board the fleet, it returned to England, and the issue of the expedition served as another cause of public discontent.

Obliged once more to have recourse to a parliament, Charles thought of diminishing the number of popular leaders by the artifice of making four of them, Sir Edward Coke, Sir Robert Philips, Sir Thomas Wentworth, sheriffs of the counties; a situation supposed to be incompatible with a seat in parliament. This measure, without attaining its object, exposed the weakness of the court, and put the commons more upon their guard. They voted the king a supply of two subsidies, but by removing the passing of that vote into a law till the end of the session, they held out an undisguised threat of withholding it, if their demands should not be satisfied. The first exertion of their power and resentment was directed against Buckingham.

The orders of Charles to the Earl of Bristol, not to attend in parliament, had not induced that spirited nobleman to comply with so arbitrary an injunction; and

the king, provoked at his refusal, directed his attorney general to enter an accusation of high treason against him. Bristol, by way of recrimination, impeached Buckingham with the same crime in the lords, while the commons were attacking him from another quarter. Their impeachment never came to a full determination; but it is remarkable, that Buckingham's accusers never adopted Bristol's charge of misconduct in the Spanish treaty, but taxed him with offences from which he found little difficulty to exculpate himself; such as administering physic to the late king without consent of his physicians. While under this impeachment, Buckingham was chosen chancellor of the University of Cambridge, and the king publicly thanked the university for their choice. When the commons resented, and loudly complained of this affront, the lord-keeper commanded them in the king's name, not to meddle with his minister and servant Buckingham, but to finish the subsidy-bill, otherwise they might expect to sit no longer. This threat was followed by another, that the king, if supplies were still refused, would be obliged to try new counsels. To strip this imprudent menace of all ambiguity, Sir Dudley Carleton explained it, by allusion to those monarchs in Christendom who had been obliged, by the turbulence of their subjects, to overthrow parliaments altogether. Adding injury to indignity, the sovereign next ordered two members of the House of Commons, Sir John Elliot and Sir Dudley Digges, the chief managers of the impeachment against the duke, to be thrown into prison, on pretence of seditious expressions; but, as those expressions could not be proved, and the commons demanded their liberation, he was obliged, with a bad grace, to release them. With similar regard for their privileges, the House of Lords claimed and obtained the liberty of Lord Arundel, whom the king had thrown into the Tower. Mixing religious with political subjects, the commons, as usual, complained of the increase of popery, and demanded the expulsion of a list of recusants from offices, (mostly insignificant individuals.) The king had before promised compliance with the wishes of the house on this point, but, when the supplies were refused, he imagined himself released from the obligation. Besides this demand, the commons intended to petition for the removal of Buckingham from his majesty's councils, and were preparing a remonstrance against the levying of tonnage and poundage without consent of parliament. But their session was ended by dissolution, before they had time to conclude one act. The House of Peers in vain interceded, that parliament might be allowed to sit some time longer. Charles replied in anger, "*not a moment longer*;" and the king and the commons, at their separation, published each an appeal to the nation. The commons, though culpable in some points, had not hitherto trespassed the bounds of the constitution. Charles had evidently done so, but his affairs were yet retrievable, if he had dismissed a worthless favourite; fulfilled some of his promises respecting recusants; abandoned the war with Spain; and entrenched himself within the limits of legal prerogative. Against the solid power of the represented people he had still a barrier to oppose, in the unquestioned rights of royalty; but in proportion as he stretched the prerogative he weakened it. To fright the constitutional attacks of the commons with usurped prerogative, was to oppose a shadow to a substance. The rights on which he now meant to act, in pursuing his *new counsels*, certainly had once been enforced by the crown

but they could now be only recalled as the phantoms of ancient usage.

Proceeding, therefore, to levy money independent of his parliament, Charles openly granted a commission to compound with the Catholics for dispensing with the penal laws. From the nobility and the city he required a loan of 100,000*l.*: the former gave it slowly; the latter refused it. The maritime towns were ordered to furnish shipping. For some time the supplies were exacted with moderation; but, on the news of Tilly having defeated the King of Denmark, a *general loan* from the subjects became necessary, for the more strenuous exertions in the war.

It was in vain that the followers of the court, and their preachers in the pulpit, enjoined submission to this loan, as a part of the duty of passive obedience. A spirit of resistance rose among the people; many refused their loans, and some were active in rousing their neighbours to insist on their common rights. By a warrant of the council, these were thrown into prison, although such as petitioned the king were commonly released. Five gentlemen alone, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Hevingham, and Sir Edmond Hamden, had the spirit, at their own expense and hazard, to defend the public liberties, and to demand release, not as a favour from the king, but as their right by law. The question was brought to a solemn trial before the Court of King's Bench. By the debates on this momentous subject, it appeared incontrovertible to the nation, that their ancestors had been so jealous of personal liberty, as to secure it against arbitrary power by six several statutes, and by an article of the great charter itself. The Kings of England, it is true, had often eluded those laws; but Charles was astonished to find, that a power so often exercised by his predecessors, was found, upon trial, to be directly opposite to the clearest laws, and supported by few undoubted precedents in courts of judicature. Sir Randolph Crew, chief-justice, had been displaced, as unfit for the purposes of the court. Sir Nicholas Hyde, esteemed more obsequious, had obtained that high office. Yet the judges, by his direction, went no farther than to remand the gentlemen to prison, and refuse the bail which was offered. Heathe, the attorney-general, insisted, that the court should enter a general judgment, that no bail could be given upon a commitment by the king or council. But the judges wisely declined complying. To exasperate the nation still farther, the soldiers of the army returned from Cadiz were billeted upon private houses, instead of being quartered at the inns or public houses; and the refusers of loans had the greatest share of those disorderly guests. Men of low condition, who showed a refractory disposition, were pressed into the army or navy; and some of higher rank were sent aboard on pretence of public duty. Martial law was proclaimed, to appease that part of the discontent which arose from the licentiousness of the soldiery: a remedy still more offensive than the evil.

If there was a chance of safety for Charles, it lay in abandoning the Spanish war; but, instead of this, while embroiled with his own subjects, and with the half of Europe for his enemies, he wantonly added France to the number: a temerity really bordering on madness. This, too, was a war of Buckingham's creating; and the motives to it would appear incredible, if the violence and profligacy of his character were not known. At the time when Charles married, by proxy, the Princess Hen-

rietta, Buckingham had appeared at Paris, to grace the scene of splendid festivity: a scene the best fitted for his superficial accomplishments; and had attracted admiration from the Queen of France herself. In the spirit of ambitious gallantry, he was preparing to return upon a new embassy, after he had brought Henrietta to England; when Richelieu, the minister, himself a disappointed lover of the queen, occasioned a message from France, to decline the honour of his visit. In a romantic passion, Buckingham swore that he would see the queen in spite of all the power of France, and determined to embroil the two kingdoms in war. After several unavailing provocations to make the French declare war,* he persuaded the king openly to espouse the cause of the Hugonots, whose leader, the Duke de Soubise, was then in London. The foolish favourite himself set sail with 100 ships and 7000 men to assist the Hugonots of Rochelle, who, uninformed of his designs, shut their gates against him. Instead of attacking the fertile and defenceless isle of Oleron, he bent his course to Rhe, which was well fortified. After allowing the garrison of St Martin to be well victualled, by his negligence, he first attempted to starve it; and, despairing of that object, sacrificed his men in storming the place without having made a breach. The small fort of La Prée, which he had overlooked in his advance, poured out a force on his retreat, which converted it into a route; and, having embarked with a third part of the force which he had taken out, he returned to England covered with disgrace.

Buckingham and his master might well tremble at the prospect of meeting a third parliament, after having squandered the money, illegally extorted from a nation already on the point of insurrection, in schemes of ambitious folly and disaster: But, in such a state of men's minds, it was unsafe to attempt raising money without a parliament.

From the king's declaration at opening the session, that, if the parliament would not do their duty in contributing to the necessities of the state, he must, in the discharge of his conscience, use the means which God had put into his hands: the commons foresaw, that, upon the first disagreement with his majesty, they might expect to be dismissed. Their decency and dignity, however, rose with the advantageous ground which so imprudent a threat afforded them. At the same time, while cautious, they were vigorous; and the most enlightened views of the rights of the people, the most definite ideas of civil liberty, and the most spirited remonstrances against the recent arbitrary measures of taxation and imprisonment, were held up in all the venerable and primitive simplicity of our language. The necessity of redress of grievances being admitted by the whole house, even by the court members, a vote was passed against arbitrary imprisonments and forced loans. Five subsidies were voted to the king, which, though inferior to his wants, were gratefully received. When his majesty's thankfulness was announced, the Duke of Buckingham's approbation was mentioned by a crown minister; but the house treated the conjunction of his name with strong disapprobation: a symptom that real respect for royalty was not yet extinguished, which, if Charles had been docile, might have taught him an important lesson.

The supply, though voted, was not immediately passed

into a law; the commons resolved to employ the interval in obtaining the sanction of the whole legislature to their petition of rights against forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, the billeting of soldiers, and martial law. The bill was called a Petition of Right; because it was only a confirmation of the ancient constitution, not an assumption of a new one. The peers leaning, in this question, to the side of royalty, proposed to moderate the petition of right, by adding to a general declaration of the rights of property and person; that, in case the sovereign be, from absolute necessity, obliged to imprison a subject, "he shall be petitioned to declare, that, within a *convenient time*, he shall, and will express the cause of imprisonment; and will, upon a cause so expressed, leave the prisoner to be tried by the common law of the land." On a conference being held between the two houses, the commons refused to annihilate their petition, by such a compromise. The king wished no less than the lords, to cheat the national spirit by some such general declaration. He did his utmost to evade the petition, by repeated messages to the house; in which he offered his royal word, that there should be no more infringements on the liberty of the subject. These promises had no effect on the commons, who pressed their bill upon the upper house. At last it passed it also, and only waited the royal assent. That assent, the king had neither the courage to give nor to refuse decidedly. Coming to the House of Peers, and being seated in his chair of state, instead of giving the expected concise assent, he made the following answer: "The king willeth, that right be done according to the laws and customs of the realm, and that the statutes be put into execution, that his subjects may have no cause to complain of any wrong or oppression, contrary to their just rights and liberties; to the preservation whereof, he holds himself in conscience, as much obliged as of his own prerogative."

The commons returned in the highest indignation at this answer. Their displeasure was first vented on the clergyman, Dr Mainwaring, who had preached, and, by special command from the king, had published a sermon containing doctrines subversive of all civil liberty. He was impeached by the commons, and sentenced by the peers, to be fined, imprisoned, and suspended. But the session was no sooner over, than Charles pardoned and promoted him to a considerable living; and, at the distance of a few years made him bishop of St Asaph. From Mainwaring, the commons proceeded to censure Buckingham; and the tempest of public hatred seemed ready to burst over his head, when it was diverted by the king's consenting to a joint application from both houses, that the Petition of Right should be sanctioned. When the words of royal assent had been pronounced, "*Let it be law as is desired*," the house resounded with acclamations; and the whole nation heard of them with joy.

The commons, however, had not yet done with remedying public grievances. They called for the abolition of a commission, which had been lately granted to 33 crown officers, for levying money by impositions or otherwise, in which *form and circumstance* (as it was expressed in the commission) *were to be dispensed with, rather than the substance be lost or hazarded*. They noticed another commission for bringing 1000 German horse to England, supposed to be levied for enforcing

* By making Charles dismiss the queen's French domestics, and encouraging the English ships to seize on those of France.

impositions. They inveighed against the conduct of Buckingham; and asserted, that the levying of tonnage and poundage was a violation of the constitution. To prevent the finishing, and presenting this remonstrance, the king came suddenly to parliament, and ended the session by prorogation. All the subsidies voted by parliament were spent in equipping a fleet and army, with a view to repair an ineffectual attempt, made by the earl of Denbigh, to relieve Rochelle. While Buckingham was superintending the intended expedition at Portsmouth, a fanatical, and vindictive man of the name of Felton, who had lately served as lieutenant in the duke's army, avenged his own and the nation's quarrel, by plunging a knife into the favourite's breast as he turned from speaking with Soubise, and some Hugonot officers, to Sir Thomas Fryar, over whose shoulder the murderer struck his blow. Buckingham cried out "the villain has killed me;" and, pulling out the knife, breathed his last. As the Frenchmen had been remonstrating with the duke, the first suspicion fell upon them; but a hat was found near the door, with a paper, disclosing the motives of the deed, and a man, without a hat, was seen walking composedly before the door, who, being seized as the murderer, answered, "I am he." Charles urged, that Felton should be tortured, to discover his accomplices; but the judges declared, that the practice, though formerly usual, was altogether illegal.

After Buckingham's death, the command of the fleet and army was conferred on the earl of Lindsay, who attempted to relieve Rochelle, but without success. That city, hopeless of relief, submitted to their Catholic countrymen, even in sight of the English fleet. By the death of Buckingham, neither pretexts nor real causes for complaint were removed from the commons. The royal favour shewn to Mainwaring and other clergymen, obnoxious for similar reasons; the inhuman and arbitrary punishments of the Star Chamber; and, above all, the subject of tonnage and poundage, afforded unexhausted sources of controversy and remonstrance. When Charles opened the session of 1629, he had foreseen, that the declarations of the commons would be renewed on this last topic; and absolutely conceded, that he never considered the duties of tonnage and poundage as any other than a gift from his people. But the commons were not satisfied with a verbal confession, they insisted, that he should entirely desist from levying these duties; a practical consequence which, it must be allowed, most naturally followed from such a concession; and which, it is not surprising, that the assertors of liberty were anxious to follow out, in treating with a monarch who was evasive in confirming all concessions, and the munificent patron of the preachers of passive obedience. Amidst political fermentation, the zeal of religion was not dormant. While the current of public belief was running towards Puritanism, the favourers of the established church were strongly tinged with Arminianism; a creed now generally adopted in the Church of England, but, at that time, held in detestation almost equally with Popery. Among the Puritans, indeed, there were many who were distinguished, not by religious, but by political sternness of principle; and, unfortunately for the Arminian, it was generally coupled with slavish principles in politics, because Laud, Neil,

and the other bishops, supposed to be tainted with that faith, were the strenuous supporters of passive obedience.

Sir John Elliot having framed a remonstrance in the commons against tonnage and poundage, the speaker, Sir John Finch, said, that he had a command from the king to adjourn, and put no question. The whole house was in an uproar; the speaker was forcibly held in his chair by Hollis and Valentine, till a remonstrance was passed by acclamation. Papists and Arminians, and those who should levy tonnage and poundage, were declared capital enemies to the commonwealth. The doors being locked, the gentleman usher of the House of Lords, who came from the king, was shut out till the remonstrance was finished. By the king's order, he took the mace from the table; and parliament was dissolved in a few days. By an act of ill-timed severity, the king commanded some of the leading members of the house* to be thrown into prison for sedition; and three others were fined, and imprisoned by the court of King's Bench, at the instance of the crown.†

It seemed, at last, to Charles, to be high time to conclude a war, begun without necessity, and conducted without glory. A treaty was accordingly signed with France; and the Hugonots, as might be expected, were abandoned. Peace was afterwards concluded with Spain, without any stipulation in behalf of the palatine; but a general promise of good offices for his restoration from the court of Madrid. Charles, at this time, joined his good offices to those of France, in mediating between Sweden and Poland, in hopes of gaining the former to the cause of his brother-in-law. Gustavus did, indeed, adopt the cause of the German Protestants, and accepted of several thousand men, raised at Charles's expence, chiefly in Scotland, under the command of the Marquis of Hamilton; but, when he had overrun Germany, he refused to restore Frederic, except on conditions of dependence on himself.

By an expedient often adopted by princes, to weaken popular power, Charles adopted his ministers from the opposing party, that he might convert patriots into supporters of prerogative, by sharing it with them. Sir Thomas Wentworth, now created lord Strafford, was made president of the council of York; deputy of Ireland; and was, in fact, the king's chief counsellor. Sir Dudley Diggs was created master of the rolls; Noy, attorney general; Littleton, solicitor general. Unfortunately, in religion, the same change of advisers was not introduced. Laud, who had become odious for loading the church with ceremonies most disgusting to the people, who was suspected of being more than half a Catholic in his heart; and who, in zeal, intolerance, and arbitrary principles, was as bigotted as any Catholic, had the chief influence over the king in ecclesiastical affairs.

Tonnage and poundage continued to be levied by the royal authority alone. The former additional impositions were still exacted; even new impositions were laid on several kinds of merchandise. The custom-house officers received orders from the council, to break into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk in default of payment. Compositions were made with Popish recusants, which

* Sir Miles Hobart, Sir Peter Hayman, Selden, Coriton, Long, and Strode.

† Sir John Elliot, Hollis, and Valentine.

became a regular part of the revenue. Compositions were also levied from those, who, by an ancient statute of Edward II. were obliged, from possessing a certain income, to receive the expensive honour of knighthood.* A stamp-duty was imposed on cards; a new tax, which, of itself, was liable to no exception, except the manner of its imposition.

The council of York had been first erected, after a rebellion, by Henry VIII. without authority of parliament, and had long acted chiefly as a criminal court. Innovations had been introduced into it by James. Sometimes Charles gave it a large, and, in some respects, discretionary jurisdiction, which, though possibly meant to save these northern counties the trouble of sending every cause to Westminster hall, in the end, put them out of the ordinary course of justice, and produced several irregular acts, which were, at this time, complained of. But the Star Chamber was the most intolerable of all tribunals, and encroached on the jurisdiction of other courts. Its punishments were enormous. Sir David Foulis was fined 5000*l.* for dissuading a friend to compound for knighthood. Prynne, a barrister of Lincoln's Inn, for reviling plays, hunting, public festivals, &c. and for blaming the hierarchy, and the new superstitions of Laud, in a book which he published, was condemned to be put from the bar, to be pilloried in two places, to lose both his ears, pay 5000*l.* to the king, and be imprisoned for life. One Allison, for reporting that the archbishop of York had incurred the king's displeasure, by asking toleration for the Catholics, was sentenced, by this tribunal, to pay 1000*l.* to the king, to be whipped, and to stand in the pillory four times.

The obnoxious tax of ship-money was revived in 1634. The first writs of this kind had been directed only to sea-port towns, but it was now levied over the whole kingdom. The money was entirely laid out upon the navy; and the effects of it were felt at the distance of a few years, when 60 sail were equipped by the earl of Northumberland, who compelled the Dutch to pay 30,000*l.* for a year's licence in fishing in the British seas: and when a squadron, that was sent against Sallee, contributed to destroy that receptacle of pirates. But greater triumphs of the English flag than those would have been an inadequate compensation to the people, for the arbitrary manner in which the money that procured them had been levied.

In 1633, Charles visited his Scottish kingdom, where his reception was affectionate and joyful. His coronation was succeeded by a parliament, which sat as usual only two days. Their supplies were liberal and unprecedented. A land tax of 400,000*l.* Scotch, and the sixteenth penny of legal interest, were granted for six years. An indefinite prerogative had been granted by the Scottish parliament to James, together with the power of prescribing robes for judges, and apparel for churchmen. When Charles sought them to confirm this latter power, a power which was to sanction the introduction of the cope and the white surplice, things abhorred by the Scottish nation, lord Melville, an aged nobleman, exclaimed aloud, "I have sworn with your father, and the whole kingdom, to a confession of faith, in which the innovations intended by these articles were solemnly abjured." Charles retired disconcerted for a moment at this answer, but returning, commanded the

parliament not to deliberate, but to vote, and shewing a list of their names, "Your names are here, (said he,) and I shall know to-day who will do me a service." The votes were collected, but there is little reason to doubt, falsely reported at the king's instance. The earl of Rothes, who questioned the truth of the report, was told by the king, that if he arraigned the lord Register of a false report of the votes, it should be at his peril. The peril, if his accusation could not be clearly established, was death. The late affection of the Scots was, by such conduct, changed into general mistrust. After the king's departure, an episcopal see was erected at Edinburgh, with a diocese extending from Forth to Berwick. The influence of Laud was scarcely less powerful in the Scottish than in the English church; and by his influence, the preachers of Arminian principles became numerous in northern pulpits. The breath of this new controversy fanned the rising flame of discontent.

Lord Balmerino was one of the nobles who had dared, in the late Scottish parliament, to speak and vote with independence. A temperate and submissive petition had been prepared by those Scottish patriots, in order to exculpate themselves from the imputation of having resisted the prerogative, and to deprecate the operation of those articles from which they had dissented. But when the design was intimated to Charles, and the royal displeasure was signified, the petition was abandoned even before it was subscribed. A copy retained by Balmerino, was, however, surreptitiously transcribed, and communicated to Hay of Naughton, the personal enemy of that nobleman. Hay remitted it to the archbishop of St Andrews, and Balmerino was imprisoned and brought to trial for its contents. He was not the author of the paper; he had interlined, with his own hand, the passages which he had thought not sufficiently humble in a submissive and inoffensive petition. A jury, industriously selected of such men as were thought desirous of Balmerino's death, were set upon his trial; yet even these were not unanimous. By a majority of suffrages, he was found guilty of having concealed the paper, and sentence of death was immediately pronounced upon him. The Scotch, however, were in such a ferment, that fear extorted a pardon, which justice and clemency would have denied. The people of Edinburgh had held consultations for his release. It was determined to burst open the prison, or, if that attempt should miscarry, to take revenge on his judges, and the eight jurors by whom he had been convicted. Traquair, who had been foreman of the jury, terrified at the danger, soon pleaded at court the policy of sparing Balmerino. While the Scotch were thus suffering violation in their religious rights, the Puritans of England were discontented at the prospect of civil as well as religious oppression, and would have gladly sought a refuge among the deserts of North America, from their restraints and persecutions. Some of them did escape to the new world, and laid the foundation of a free government, which has lasted ever since. But even the liberty of emigration was refused, and eight ships, ready to sail with emigrants from the Thames, were detained. In one of these ships were John Hambden and Oliver Cromwell. In the absence of parliament, the arbitrary principles of the court continued to be put in practice, by the violation of the

* This law has been used by Edward VI. and Elizabeth as an expedient for raising money. Hume says, that one reign had elapsed since its revival; but that is a mistake, for Rapin mentions its revival under James.

petition of rights in every article ; and when men were selected for imprisonment by the king and council, they were refused bail or releasement.

John Hambden had been rated at twenty shillings of ship-money, for an estate which he possessed in Buckinghamshire. The judges had already declared, that the king might impose the tax of ship-money, in cases of necessity, and that he was sole judge of that necessity. Hambden, not dismayed by this illegal declaration, nor by all the power of the crown, resolved to stand a legal prosecution, rather than submit to the imposition. The case was argued during twelve days in the exchequer chamber. The prejudiced judges (four excepted,) gave sentence in favour of the crown. Hambden, however, obtained by the trial, the end for which he had generously sacrificed his safety and his quiet. The nation was roused from its lethargy, and their indignation was thoroughly awakened against the arbitrary designs from which the tax had proceeded, and the prostitution of judicial authority, which gave sanction to those designs.

We have already seen in what state of mind Charles had left his Scottish subjects. By an unfortunate attempt to force a liturgy into their national church, he called their secret discontents into open action. The liturgy destined for Scotland was a little different from the English, but in receding from that service, it approached more to the forms of popery,—a religion which was never named in Scotland without horror. During the whole week before the new service was to be performed in the churches of Edinburgh, the people were agitated by discourses and pamphlets. On Sunday the 23d of July, the dean of Edinburgh prepared to officiate in St Giles's, and the bishop of Argyle in the Grey Friars' church ; and to increase the solemnity, each was attended by the judges, prelates, and a part of the council. The congregation in St Giles's continued quiet till the service began, when an old woman, impelled by sudden indignation, started up, and exclaiming aloud against the supposed mass, threw the stool on which she had been sitting at the dean's head. The service was interrupted by a wild uproar, and but for the interposition of the magistrates, the bishop might have been sacrificed at his own altar. When most of the people had retired, and the turbulent had been excluded, the doors were locked, and the service was resumed ; but was soon overpowered by the people from without, who burst open the doors, broke the windows, and rent the air with exclamations of, "A Pope, an Antichrist, stone him, stone him !" With a few exceptions the prelates were equally unsuccessful throughout all Scotland in imposing the liturgy.

The Scottish privy council plainly perceiving the resolution of the whole nation, represented to Charles the difficulty of enforcing the new rites. Their remonstrance had no effect, but to produce a threat from the sovereign of removing the seat of government from Edinburgh. In the mean time, a conflux of supplicants against the liturgy, from all Scotland, arrived at Edinburgh ; and an accusation against the prelates was subscribed by all ranks, from the peer to the peasant. The citizens of Edinburgh, exasperated at the threat of the seat of government being removed, surrounded the town council house, and demanded the replacing the ministers who had been ejected for refusing the liturgy. In this tumult, the principal citizens, and even the wives and sisters of the magistrates, took a share.

VOL. IV. PART II.

The council, uninstructed by Charles, conceded a most important point to the supplicants, in permitting the celebrated Tables, a representative body of nobles, gentry, clergy, and burgesses, to sit permanently in Edinburgh, while the multitude dispersed to their homes. An evasive answer from court was insufficient to satisfy the public mind. A formal revocation of the liturgy was required, and the accusation of the prelates proceeded to be urged by the Tables. A royal proclamation was issued, denouncing the supplicants as traitors ; but the effect was only to summon once more the whole body of those men around their chiefs, and the proclamation was every where met by a protest, held equally legal and sufficient to counteract its effects.

But the great æra in this religious union of the Scotch, was the renewal of the national covenant, first framed at the Reformation, when the lords of the congregation, by their bond, or covenant, undertook the protection of the infant church. This renewed a memorable bond, by which the subscribers solemnly renounced Episcopacy as well as Popery, and engaged to defend each other, and to support the sovereign in the preservation of religious liberty ; and was prepared by Alexander Henderson, the leader of the clergy, and Archibald Johnston, afterwards of Warriston, an advocate. It was revived by the lords Balmerino, London, and Rothes. It was sworn to by nobles, gentry, clergy, and burgesses, and by thousands of all denominations, after solemn exhortation and prayer in the Grey Friars' church of Edinburgh. Throughout Scotland, it roused and agitated the people by a zeal unfelt since the Reformation.

The king began to think of temporizing with the Scotch when it was too late. He sent the marquis of Hamilton with authority to treat with the Covenanters. He required the covenant to be renounced and recalled. The Covenanters answered, that they would sooner renounce their baptism. Hamilton returned to London ; made another fruitless journey with new proposals, and was again sent back by the Covenanters. After some negotiation, Charles made concessions, which, at an earlier period, might have proved satisfactory. He recalled the canon's liturgy and the high commission, suspended the articles of Perth, and seemed only anxious on any terms to continue the bishops. But the Scotch could not now think themselves secure, without the absolute abolition of Episcopacy. A weak attempt was made amidst these disputes to substitute a counter-covenant, in which the renunciation of Popery, and submission to the royal authority, were combined ; but the new bond was signed by few, and with little zeal. An assembly, which Charles had agreed to grant to the Scottish religionists, was held at Glasgow ; an assembly, which, from a large accession of the nobility and gentry, far exceeded in influence what the ecclesiastics alone could have possessed. As a preparative to the abolition of Episcopacy, there had been laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, of heresy, simony, bribery, perjury, cheating, and numerous other crimes, to the suspicion of which the lax lives of the episcopal clergy had but too much exposed them. The bishops sent a protest, declining the authority of the assembly. The commissioners, too, protested against the court as illegally constituted, and in his majesty's name dissolved it. But this measure was foreseen, and little regarded. The court still con-

4 B

tinued to sit. All the acts of assembly since the accession of James were, on strong grounds of reason, declared null and void; and with these the acts of parliament regarding ecclesiastical affairs. Thus Episcopacy, the high commission, the articles of Perth, the canons, and the liturgy, were abolished, and declared unlawful; and the whole fabric which James and Charles had been rearing with so much industry, fell to the ground. Of 14 bishops whom the assembly degraded, eight were excommunicated, four were deposed, and two were merely suspended from ecclesiastical functions. These were bold proceedings. Yet it may still be doubted if, with so much justice on their side, they intitled the sovereign to think of coming to the last extremities. But Charles's preparations for war were by this time far advanced; it appears indeed that he anxiously solicited the rupture with the assembly, to justify having recourse to arms. By economy he had amassed about 200,000*l.*; loans were procured from the nobility; his queen incited the Papists, and Laud instigated the clergy, to contribute to this Episcopal war. The nobility were summoned to attend their sovereign at York. The Scotch had not been idle in meeting the hour of danger. The covenant had been received by Scotchmen abroad as well as at home. Lesly, a commander distinguished in the Swedish service, was recalled, to lead the Covenanters at home, and he was followed by many experienced officers, who had served Gustavus. Arms, ammunition, and artillery were provided, and the people were trained to the use of them. After France and Holland had entered into a league against Spain for the partition of the Netherlands, England had been invited to a neutrality. But Charles, in replying to the French ambassador, threatened to send 15,000 troops to oppose the partition; an impolitic threat, in return for which Richelieu now secretly supplied the Covenanters with money.*

When the king's forces had assembled at York, when Huntly began to arm for his cause in the north, and the marquis of Douglas in the south, the Covenanters seized, by surprise, some of the most important fortified places. Edinburgh, Dunbarton, and Dalkeith, fell at once into their hands. The marquis of Hamilton arrived with the king's fleet from England; but he found Leith, which had been fortified by volunteers of all ranks, secure from assault, and could only land his few regiments on the uninhabited islands of the Forth. The king advanced from York to Berwick with 23,000 horse and foot, and the Scotch, to the number of 24,000, encamped in sight of his army on Dunse Law. The latter had hitherto, though with swords in their hands, constantly addressed Charles as their sovereign, petitioning redress of grievances from him, and never desisting from pacific overtures. Formidable as they seemed from their numbers, zeal, national spirit, and the excellence of their officers, the king listened to their proposals. His own army had few officers of experience, and the men were inspired by no such zeal as that which animated the Scotch. In the pacification of Berwick, it was agreed, that the armies on both sides should be disbanded, and that ecclesiastical matters should be referred to the decision of another assembly, and civil affairs to another parliament soon to be summoned. The fortifications of Leith were surrendered, and 30 castles were restored to the king's government.

The assembly of the Scottish church accordingly met, and again abolished Episcopacy, stigmatizing the liturgy, canons, and high commission, as before. The Scottish parliament also assembled, a truly patriotic parliament, who proposed to re-establish all their legislative rights which had been usurped since the accession of James, and to rectify many public abuses. Charles, who had never been sincere in his treaty with the Scotch, made these proposals a pretext for suddenly ordering the earl of Traquair to prorogue their parliament, and both sides again prepared for hostilities. The bigotry of Laud, and the violence of Wentworth, overpowered in the English council the moderation of Hamilton and Morton; for to those four, under the name of the *junto*, the Scottish affairs had been long entrusted. A letter, which had been signed by seven of the Scottish nobility before the pacification of Berwick, and addressed to the French king, (but from proper motives never sent,) to solicit assistance, was thought a sufficient justification of war on the royal side; and Loudon, the Scottish commissioner from the Covenanters, was ordered for execution, (though the order was revoked,) for being the author of the letter.

After eleven years intermission, it was necessary to convoke another parliament in England. By the mouth of the lord keeper Finch, the king discovered his wants, and representing his debts, for which he had given security on his crown lands, amounting to 300,000*l.*, pleaded for immediate supplies to support his armaments, and promised, though indefinitely, to promote the best wishes and interests of his English subjects. The house of commons, instead of listening to his wants, began with arranging the grievances of the public, under three different heads: those of the broken privileges of parliament, of illegal taxes, and of violence done to the cause of religion. After an intercession on the part of the peers in the king's behalf, which, so far from obtaining the supplies, was declared by the commons to be an illegal interposition, Charles dissolved the parliament; and to make this procedure still more dangerous and unpopular, imprisoned Bellasis and sir John Hotham, for the share they had taken in the debates.

Though the parliament was dissolved, the convocation of the clergy was still allowed, which, besides granting to the king a supply from the spirituality, imposed an oath on the clergy and the graduates of the University, to support the established government of the church, by archbishops, bishops, deans, chapters, &c. The public notions of liberty were too far matured not to perceive, that such an assembly as the convocation, without consent of parliament, was unconstitutional; and an oath, which contained an &c. was justly exposed to ridicule. In the mean time, subscriptions were raised at court, or extorted from the merchants; nor were former illegal exactions, however productive of discontent, omitted. Instead of Arundel, Essex, and Holland, whose capacity, or whose zeal, in the last expedition was suspected, the earl of Northumberland was appointed general, the earl of Strafford lieutenant-general, and lord Conway general of the horse. The army which was now raised, consisted of 19,000 foot and 2000 horse.

The Scottish Covenanters and parliament, were much more successfully active. The parliament having secured their own constitution, by the creation of a third estate; having passed a statute for triennial renovations,

* To the amount of 100,000 crowns.

and having guarded the legislative power against the encroachments of royalty by other wise regulations, appointed a committee of estates to superintend at the camp and in the capital, the operations of the war. Conscious of the good wishes of the popular party in England, and we may well suppose in correspondence with the English parliamentary leaders, they crossed the Tweed with 23,000 foot, 3000 horse, and a train of artillery. Maintaining as before the most submissive language, they entered England, they said, with no hostile intentions, but to obtain access to the king's person, and lay their petition at his feet. At Newburn upon Tyne they were opposed by general Conway, with batteries erected on the opposite bank, and 6000 horse and foot. Lesly, their general, first requested permission to pass; then on a shot being fired by an English centinel, they opened their artillery, and charging their opponents, put them to flight. Their army thus obtained immediate possession of Newcastle, Tynemouth, Shields, and Durham. Charles retired with a mutinous and panic-struck army from Northallerton to York, where an address reached him from the city of London, petitioning for a parliament. He contented himself, however, for the present, with summoning a great council of the peers at York. A treaty was suggested, as the only means to prevent the advance of the Scotch; and as that enemy still held out the language of petition, sixteen noblemen, eminent for their rank and popularity, were proposed to negotiate with the committee of the Scottish estates. In the mean time, to exempt the four northern counties from the contributions of the Scottish army, the sum of 850*l.* a day was allowed for their subsistence. A loan of 200,000*l.* was obtained by the credit of the peers; and Charles was thus in the singular situation of a sovereign supporting two hostile armies at once in the field. As many difficulties occurred in the negotiation, it was proposed to transfer the treaty from Rippon to London, a change of place by no means favourable to the royal cause. Charles yielding in despair to the torrent which he could not stem, as he had foreseen that the council of the peers at York would advise him to call a parliament, told them in his first speech, that he had already taken that resolution.

During the recent transactions in Scotland, we may easily conceive the state of the public mind in England, and the deep sympathy of Puritans and Presbyterians with their fellow believers, who were regarded rather as brethren in a common cause, than invaders. As the parliament met with no ordinary prospects and motives, the House of Commons was never observed to be so full at the opening of a session. The house began by striking an important blow, by impeaching Strafford the king's principal adviser. Hated by the Scotch for having used all his influence against them; by the Irish, for having acted in their kingdom as deputy, with an unpopular vigilance and activity; and considered by the English popular party as an apostate from their cause, he was exposed to the resentment of the three nations. The king had induced him to leave the army by a promise of protection, and assuring him that not a hair of his head should be hurt; but just as he entered the House of Peers, he found that Pym had brought up his impeachment from the commons, followed by the whole house. He was immediately ordered into custody. Laud could not long escape the scrutiny. He was also impeached for high treason by the commons, and ordered into custody. The lord keeper Finch, justly obnoxious for hav-

ing, on an important occasion, refused to put the question when ordered by the House of Commons; for having procured, by intrigues and menaces, the extrajudicial opinion of the judges, in the case of ship-money; and for having been active in many illegal measures, tried to deprecate the wrath of the commons by submission; but finding that his impeachment was resolved on, he fled to Holland.

Spreading the terrors of their power still farther, the commons proceeded to the punishment of those agents of royalty, who could not properly be attainted for high treason, but whose co-operation with tyrannical measures, (though, in many instances, involuntary,) brought on them the new term of delinquents. The sheriffs, who had levied ship-money, were voted such; the farmers and officers of customs concerned in raising poundage and tonnage, were severely fined; the members of the star-chamber, and high commission courts, were voted worthy of punishment; the judges, who had voted against Hambden in the case of ship-money, were obliged to find surety for their appearance; and Berkeley, a judge of the king's bench, was seized on his tribunal by an order of the house. The sentences which had been executed against Prynne, Bastwick, and other libellers of the court, were reversed, and their judges were ordered to make reparation to the sufferers. When those liberated patriots returned to London, they were met by multitudes, and the roads before them were strewed with flowers; and amidst the shouts of congratulation that attended them, were intermingled loud invectives against their late oppressors. Grievances were now represented, both by members within and petitioners from without, in such numbers, that the house was divided into above forty committees; charged each of them with the examination of some particular violation of law or liberty; and from the reports of these committees, the house daily passed votes which humbled the court, and elated the nation. Ship-money was declared illegal and arbitrary, the sentence against Hambden cancelled, the court of York abolished, compositions for knight-hood stigmatised, and every late measure of administration treated with reproach and obloquy. Among the petitions from without, there was one which strongly indicated the state of the popular mind as to the church. A petition from the city, signed by 15,000 names, for a total alteration of church government, was presented by alderman Pennington, the city member.

The pretensions of the commons to the right of imposing tonnage and poundage, by their own authority, were revived with assurance of success. In the preamble to the bill which they passed, for granting these duties to the king, they divested the crown of all right of levying them without their consent. Charles was obliged to pass this important bill, as well as to confirm, though with more reluctance, a bill for reviving triennial parliaments, after the example lately given by the Scottish parliament. A change of ministers, as well as of measures, was resolved upon. The Earls of Hartford, Essex, Bristol, Lord Kimbolton, and other noblemen of the popular party, were sworn privy counsellors. Juxon, bishop of London, resigned the treasurer's staff; but his character, and the moderation of his enemies, allowed him to remain unmolested. A feeble negotiation for the introduction of Pym, Hambden, and Hollis, into office, was interrupted by the death of the Earl of Bedford; and from circumstances imperfectly explained by historians, was never resumed. Unhappily for Charles, he conti-

nued, after his old ministers had been exiled and displaced, after the imprisonment of Laud, and the execution of Strafford, to govern by means of weak agents, destitute of energy or of credit with parliament.

The fate of Lord Strafford was not long delayed after his commitment to the Tower. To bestow the greater solemnity on his trial, scaffolds were erected in Westminster hall, where both houses sat, the one as his accusers, the other as his judges. Besides the chair of state, a close gallery was prepared for the king and queen, who attended during the whole trial. Twenty-eight articles of impeachment were presented against him, regarding his conduct as president of the council of York, as deputy of Ireland, and commander in England. But though four months were employed by the managers in framing the accusation, and all his answers were extemporary, he certainly baffled the arguments of his accusers, and fell by an illegal sentence. The evidence against him was inadequate to establish the charge of absolute treason. He was convicted, even according to his enemies, of that constructive or accumulative treason, the bare admission of which, as grounds of sentence, is a disgrace to any tribunal, and would sanction the most enormous tyranny if it became a practice. The fear of popular violence had probably no small share in the decision of the Lords with respect to this unfortunate nobleman, and the same battery was applied to force the king's assent. Charles was irresolute; but Strafford, either hoping of escaping alive out of prison, or expecting that Charles might be touched more deeply by an offer of his own life, advised the king to sign his death-warrant, in order to quiet the tumultuous people. Charles at last granted a commission to four noblemen to give the royal consent to the bill for his execution,—an act for which he never forgave himself.

The commons, it may be said, were, without just grounds, jealous, that all the power which they had extorted from the king might be yet revoked, if they stopt at the present stage; but we may suppose them, nevertheless, to have been sincere in those fears. The execution of Strafford is a blot on the memory of that parliament, which it is possible for their advocates to palliate, but not to efface. The bill which they introduced at this period for their perpetual continuance, was a stretch of power which can only be vindicated by the plea of necessity. Charles empowered the same commissioners, who signed the warrant for Strafford's fate, to assent to this bill, and for the present conceded an entire victory to the popular power. From policy, more than necessity, the commons had borrowed money from the citizens, for the payment of the two armies during the negotiation with the Scotch, which was now transferred from Rippon to London. The citizens started difficulties with regard to a farther loan, declaring, that though they willingly trusted the parliament, they wished for the continuance of their sitting as a security for their repayment; and on this pretence the bill for continuance was voted and passed.

Among the demands of the Scottish commissioners, there were two to which Charles felt most reluctant to

accede,—the tacit confirmation of the late acts of the Scottish parliament, including almost every civil and religious demand; and the punishment of incendiaries, i. e. of such civil ministers and prelates as were thought to have advised the king to hostilities with the Scottish nation. The prosecution of incendiaries was at last referred to the English parliament, and tacitly reserved to the king; it being understood that they were to be forever excluded from his person, and from offices of trust. Of 300,000*l.* which the English parliament voted as a brotherly assistance to the Scotch, and which the Scotch claimed as an indemnification for their share of losses by the war, a fourth part was advanced. Ecclesiastical conformity was referred to the English official arrangements, and to the Scottish parliament. The king had already announced his intention of visiting Scotland once more; a journey of which the commons were afraid, as it would lead him directly through the heart of both armies.* As he refused to defer his departure, they ordered the arrears to be provided, and both armies to be withdrawn.

A small committee of both houses attended the king, in reality to act as observers of his conduct. These were the Earl of Bedford, Lord Howard, Sir Philip Stapleton, Sir Wm. Armyne, Fiennes, and Hamden.

Amidst this variety of distracting affairs, the king concluded the marriage of the Princess Mary with William, Prince of Orange. The parliament assented to this measure with satisfaction.

On the King's arrival in Scotland, he had the mortification to find Montrose, and others of his friends, imprisoned for that detected correspondence which they had maintained with him during the treaty of Rippon. Scotland now beheld, perhaps for the first time, a parliament, whose deliberations, instead of being limited as formerly to a single day, were pursued for months without interruption in the presence of the king. The lesser barons, hitherto restrained to a single suffrage for each county, now assumed, for the first time, each a separate and independent vote. Since the detection of Montrose's treachery, the parliament were more inclined than ever to adhere to their accusations against the incendiaries; with a patriotic desire also of rendering their government independent of the English cabinet, they wished to possess influence in the nomination of ministers; a last sinew of his prerogative, of which Charles was naturally tenacious. By mutual accommodation, the number of incendiaries was reduced to five, both plotters† and incendiaries were released from prison, and their sentence was to be referred to the king. Charles, on his part, submitted to choose his ministers, with the approbation of the Scotch estates while they sat, and of his privy council, who themselves were chosen with the approbation of the estates, when the estates should be adjourned. He agreed to deprive of their seats, four judges who had adhered to his interests, and others were chosen more agreeable to the ruling party. Several of the Covenanters were sworn into the privy council. The king bestowed pensions and preferments on Henderson, Gillespie, and other popular preachers, and practised every art to soften his enemies. Argyle was created a mar-

* It was not without reason that the commons were jealous of the king's personal influence with the armies, as an association was discovered this year, (1641), headed by some principal officers, Piercey, Jermyn, Oneale, &c. whose object was to get the army to petition (that is demand) a restitution of the power assumed by parliament. The king had countersigned a rough draught of the intended petition.

† The plotters were those concerned in Montrose's late treachery to the covenant.

quis, the Lords Loudon and Lindsay earls, and the title of the Earl of Leven was bestowed on Lesly. The Earl of Lanerk continued Secretary, Roxburgh Lord Privy Seal, and the Treasury was put in commission. Argyle was preferred by parliament as candidate for the office of Chancellor; but the king, though he bestowed on him a new title, wished not to aggrandise so popular and powerful a nobleman with new power.

Argyle and Hamilton held, at this time, the principal ascendancy in the Scottish parliament. The latter had entered the covenant as a spy from the king; but, according to Clarendon, Montrose, in revealing the secrets of the Covenanters, imparted, that Hamilton was as hearty in the covenanting interest as Argyle. Montrose had already denounced both Hamilton and Argyle, as traitors; and had communicated, there is little doubt, intelligence of the secret correspondence of those noblemen with the parliamentary leaders in England. Their guilt he offered to assert and prove in parliament; but rather advised, that they should be assassinated, and undertook the assassination himself.

The plot for the arrestation of Hamilton and Argyle, an event in Scottish history commonly denominated *the incident*, has been frequently called suppositious; but that their arrest was intended by the earls of Crawford and Cochrane, admits of no dispute. They were to have been conveyed, it was said, under guard of Cochrane's regiment, stationed near Leith, where a frigate was ready, in the roads, to convey them off. The two noblemen, however, fled to Kinneil, the seat of Hamilton's brother. The king, who came next day to the Scottish parliament with 500 men in arms, complained of the injurious surmises excited by their flight. The leaders of the English parliament understood this affair of the incident, to which so many historians who have recorded it have been blind. They knew, that Montrose had betrayed their late correspondence with the Covenanters; that Charles, wishing to revive obsolete treasons, intended to impeach them, and bring them to execution; and that the seizure of Argyle and Hamilton was the forerunner of his intentions. When the news of the incident, therefore, reached England, the commons applied immediately for a guard, and obtained it from Essex, whom the king had left general in the south.

In the midst of these transactions, intelligence arrived of the Irish rebellion,—an event unparalleled, for horror and cruelty, in our own annals. The king had not left Scotland when the first information of this dreadful affair was transmitted to him, but the extent of its enormity was not at first known. The Scottish parliament has been represented as indifferent to the fate of their fellow Protestants; but, it seems, that Charles, unacquainted himself with the extent of the rebellion, represented it as insignificant to the parliament. The danger was no sooner discovered, than they offered 3000 stand of spare arms, and 10,000 men for the relief of Ireland; a relief which, if timely accepted, might have proved sufficient.

The king, upon his return from Scotland, was received in London with shouts and acclamations of the people. Sir Richard Gournay, the lord mayor, had promoted these favourable dispositions, and had persuaded the populace to give some marks of affection to the king, so apparently inconsistent with their past and subsequent contempt of him. But the pleasure which Charles en-

joyed from this reception was speedily damped, by a remonstrance of the commons, which was presented to him immediately on his return. This remonstrance, which contained a merciless and minute exposure of all that was unfortunate, invidious, or faulty in his reign, was not voted in the commons without a warm debate of the house, and carried by a majority of only eleven. It concluded with recommending the appointment of ministers, in whom the parliament might have reason to confide. Although the acrimony of this remonstrance was extreme, the conclusion showed that a constitutional remedy, if not certain, was at least open to trial. The public confidence at that time was denied to those ministers of Charles who had deserted the public cause: it was withheld from the servile insolence of Archbishop Williams, from the levity of Digby, and the infamy of Saville; but was reserved for the unassuming, but inflexible virtues of Hambden, the mild integrity of Kimbolton, the sincere and ardent genius of Hollis, and the cool sagacity of the aged Pym.

From this period the proceedings of the commons became more bold, determined, and violent. They had accused thirteen bishops of high treason, for enacting canons without consent of parliament. They brought a bill forward twice in the same session, for taking away the votes of these bishops. This exclusion of the popish and spiritual lords, was at last accomplished by popular tumults, which the commons kept alive by politic design, and to which the supporters of loyalty and hierarchy only gave force by resistance. The latter party were now denominated the cavaliers; while their antagonists, from the short cut of their hair, were contemptuously called round heads. Several reduced officers, and young gentlemen of the inns of court, during the menaces and assemblies of the populace round Whitehall, offered their services to the king; and had frequent, and sometimes bloody, skirmishes with the people.

While the tumults raged, Williams, the archbishop of York, exasperated at some indignities which he had received, hastily called a meeting of his brethren, and by his advice, a protestation was addressed to the king, setting forth, that they had been menaced and assaulted by an unruly multitude, and could no longer exercise their right of attending and voting in the house. For this reason, they protested against all laws and resolutions that should be voted during their constrained absence. As soon as the imprudent protestation was presented, the peers desired a conference with the other house. The commons immediately sent up an impeachment of high treason against the protesting bishops, for endeavouring to subvert the fundamental laws, and to invalidate the authority of the legislature. No man in either house ventured to speak a word in their vindication, so much was every one displeased at their egregious imprudence.

A few days after, the king was betrayed into an indiscretion still more fatal, to which all the ensuing disorders and civil wars may be ascribed.* This was, the impeachment of Lord Kimbolton and the five commoners, Hollis, Sir Arthur Hazlerig, Hambden, Pym, and Strode. Charles is supposed to have been impelled to this measure by the advice of the queen and the court ladies, and of Lord Digby.

Herbert, attorney-general, appeared in the house of peers, and in his majesty's name preferred articles of

* Hume.

impeachment against these six individuals; importing, that they had endeavoured to subvert the laws, to deprive the king of his just power, to draw his army to disobedience; that they had endeavoured to compel the parliament by force and terrors to join them, and had actually levied war against the king. The injustice of attempting to punish the connection of those men with the Scottish Covenanters, after an act of oblivion, and all that had passed, could only be equalled by the folly of attempting to seize them. A serjeant at arms demanded the five commoners from their own assembly: he was sent back without a positive answer. Messengers were employed to search for the members, who sealed and locked their trunks and private apartments. The king came next day in person to demand them of the house of commons; but the five commoners had a private notice to withdraw a moment before the king entered.* The king left his retinue of about 200 men, some with halberds, others with walking swords at the door, and advanced alone through the hall, while all the members rose to receive him. The speaker withdrew from the chair, and the king took possession of it. He repeated his resolution of seizing the accused members wherever he could find them; of proceeding against them in a fair and legal way; and expected, as he had not come to take them by force, but by lawful authority, that the house would send them to him. He then asked the speaker, if they were in the house. "Sir," answered the speaker, (falling on his knee,) "I have neither eyes to see, nor tongue to speak in this place, but as the house is pleased to direct me, whose servant I am; and I humbly ask pardon that I cannot give any other answer to what your majesty is pleased to demand of me." The commons were in the utmost disorder; and when the king was departing, some members cried out, "Privilege, privilege!" The house immediately adjourned.

In the evening, the accused members flew to the city, which was their fortress. The citizens were the whole night in arms. Next morning about ten, Charles, attended by a few lords, repaired to a meeting of the common council at Guildhall, to whom he justified his intentions respecting the fugitives, and hoped that they would not find protection in the city. This measure only produced new mortification. On his way back, the streets resounded with cries of privilege of parliament; and one of the populace called out, near his coach, "to your tents, O Israel!" the watch-word of mutiny among the Israelites, when they abandoned Rehoboam.

When the commons met, they either felt, or affected dismay, and adjourning for some days, ordered a committee to sit in Merchant Taylors Hall. They met again to confirm the resolution of that committee on the illegality of the king's attempts to seize their members; and when the popular mind was wrought up to the highest pitch of passion in their cause, brought the accused members in military and triumphant procession to resume their seats. The river was covered with vessels laden with small pieces of ordnance, and prepared to fight; and Kippon, appointed by parliament to be major-general of the city militia, led a tumultuary army to Westminster-hall. The king, who, disconsolate and alarmed, had retired to Hampton Court from Whitehall, sent a message to the commons, proposing that they

should agree upon a legal method, by which he might carry on his prosecution against the members. They desired him to lay the grounds of prosecution before the house, declaring that they would judge themselves whether it were proper to surrender their members for trial. By successive messages, he offered every concession in his power, to pardon the members, and to make reparation for the breach of privilege. The commons would accept of no reparation without an acknowledgment of his advisers—a cruel condition, to which he could not submit without humiliation. The commons had already stript the king of almost all his privileges, the bishops were fled, the judges were intimidated; it now only remained, that, after securing the church and the law, they should get possession of the sword also. The assumptions of the commons at this period, can be justified only by their firm belief, that the king still intended to revoke whatever concessions he had already made in favour of liberty. Unfortunately the earlier history of his reign betrays an insincerity in the character of Charles, which makes his treachery in the present crisis too credible. The late attempt to arrest the five members, connected as it must seem to be, with the incident in Scotland, justifies the strongest suspicions of the king's willingness to break the amnesty, and peculiarly justifies the suspicions of men, whose lives were in imminent danger, and whose passions were swayed by the turbulence of the times. Since the parliament had just grounds to feel insecure from the king's intentions, since they knew, that by removing Balfour, a man of popular principles, from the government of the Tower, and substituting the Earl of Newport as governor in his place, and by preparations for securing Hull and Portsmouth, that he had premeditated reducing them by force of arms; and since they had seen him uniformly refuse the constitutional remedy of accepting a popular ministry, they certainly did not claim the command of the army without a strong plea for that otherwise unconstitutional demand. But whatever were Charles's intentions, we cannot wonder that he should refuse this last concession. After obliging him to concede that the Tower, Hull, and Portsmouth, should be entrusted to persons appointed by parliament, the commons demanded that the officers of the militia should be of their own nomination. He was at that time at Dover, attending the queen and the Princess of Orange, as the latter dreading the popular clamour at her religion, as well as for the sake of raising resources for the anticipated civil war, was leaving the kingdom. The king at first evaded the demand, by requesting leisure to consider it. When the commons pressed their remonstrances for embodying and directing the militia under the management of both houses, and desired the command of the army even for a limited time, he exclaimed, in a burst of exasperation, "*No, not for an hour.*"

In this state of contention with the parliament, London was evidently an unsafe residence for the king. Accordingly, taking the Prince of Wales and the Duke of York along with him, he arrived by slow journeys at York. Here he found the public spirit much more strongly in his favour than in the south; and the nobility and gentry from all quarters, either personally, or by messages and letters, expressed their duty towards him. The queen, who was in Holland, was making

* The Countess of Carlisle, Northumberland's sister, was entrusted with information of the king's intention, and caused the members to be informed.

successful levies of men and ammunition. But, before war was openly declared, the shadow of a negotiation was carried on, rather with a design to please the people, than with any view of reconciliation. Mutual remonstrances passed; in which those of the king, assisted by his secretary Lord Falkland, were eminent for ability and eloquence. The parliament sent to the king nineteen propositions as the basis of an agreement, which, by the king's friends, were considered as absolutely subversive of monarchy. They required, that no man should remain in the council, nor officer be chosen, without their consent; that no deed of the king should be valid unless it passed the council, and be attested under their hand; that none of the royal family should marry without consent of parliament and council; that the laws should be executed against Papists; that Popish lords should not vote in parliament; that the liturgy and church government should be constituted according to the advice of parliament; that the militia should be subject to their controul; that the justice of parliament should pass upon delinquents; that a general pardon should be granted, with exceptions to be made by parliament; that the forts and castles should be disposed of by consent of parliament; and that no peers should be made but with consent of both houses. "If I should submit to these terms," said Charles, "I may have my hand kissed, and may retain the title of Majesty, but I should remain but the *outside*, the *picture*, the sign of a king."

In all the commands which the parliament issued, they bound the persons to whom they were directed, to obey the orders of his majesty signified by both houses of parliament; and, distinguishing between the office and person of the king, those forces which they employed against him they levied in his name, and by his authority. To their ordinance respecting the militia, the king opposed his commissions of array. The counties obeyed the one or the other according as they stood affected, and in many places skirmishes immediately ensued. The magazine of Hull contained the arms of all the forces levied against the Scots. Charles expected to overawe the governor, Hotham, into submission, if he could gain admission with his retinue; but the governor shut the gates against him.

Never did a war seem more unequal than the present at its commencement. The king's revenue, which had been scantily dealt out to him before, was stopt after he fled to York. The armies raised for Ireland by parliament, were now devoted to act against him, under the command of Essex. In London, no less than 4000 enlisted in one day. The requisition of the parliament for loans of money and plate was so well obeyed, that there was hardly room to stow the treasure, or men to receive it; and such zeal animated the city, that the rich women bestowed their plate and ornaments, and the poorer their silver thimbles and bodkins. London, and all the seaports except Newcastle, were in the hands of parliament; of which the customs yielded them a certain and considerable supply, and the seamen naturally followed the disposition of the ports to which they belonged.

The king, it is true, was surrounded by a splendid nobility, and a faithful body of gentry, who diffused their loyalty among the rustic and hardy retainers whom they raised on their own estates. Above forty peers of the first rank attended him. The bishops and the clergy, too, were on his side, although these, in a war with

Puritans, were not likely to overawe their enemies. Spain, from motives of bigotry, supplied some money and arms to his unpopular auxiliaries the Irish; and the Prince of Orange encouraged some English officers in his service to enlist on Charles's behalf. But the forts, magazines, arms, and fleet were in the hands of his enemies. Only a part of the queen's succours arrived from Holland; and Charles was obliged, in order to arm his followers, to borrow the weapons of the train-bands, under a promise of restoring them when peace should be settled.

The royal standard was first erected at Nottingham; but whether from a natural hesitation to commence hostilities, or from inattention to the preparations of a feeble enemy, the parliament, with a superior force at Northampton, neglected to dissipate the few troops that resorted at first to the king. Charles was suffered to retire unmolested to Shrewsbury, to collect his levies, and to interpose with an equal army between Essex, the parliamentary general, and the capital. On mustering his army in that situation, the king found it amount to 10,000 men. The earl of Lindsey, who had acquired some military experience in the Low Countries, was made general; Prince Rupert, a son of the elector palatine, who was early in the war, distinguished by his promptitude and courage, commanded the horse; Sir Jacob Astley the foot; Sir Arthur Aston the dragoons; Sir John Heydon the artillery. Such was the low state of military skill in England, produced by a long peace, that, after the hostile armies set out, the king's from Shrewsbury, the other from Worcester, they marched ten days in mutual ignorance of each other's motions. On the 23d of October they met at Keinton, or Edgehill, in the county of Warwick. Both the wings of Essex, the parliamentary general, were at first put to flight by the shock of Prince Rupert's cavalry, and the troops under Wilmot and Sir Arthur Aston; but the king's reserve, judging, like raw soldiers, that the day was won, took too prompt a share in the chase, and were watched by Sir W. Balfour, the commander of the parliamentary reserve, who wheeled upon them suddenly, and converted their victory into a doubtful defeat. Returning to the charge, the two armies faced each other for some time, without courage on either side to renew the attack. All night they lay under arms. Next day Essex first drew off towards Warwick, and the king to his former quarters. Five thousand are said to have perished, in nearly equal shares, on both sides. Charles's nearer advance to London, and a few slight successes after this victory, brought on the treaty of Oxford, when winter concluded this first campaign. As the condition of Charles's recal, the parliamentary commissioners required the militia to be left to the disposal of the two houses, Episcopacy to be quite abolished, and ecclesiastical controversies to be determined by an assembly of divines. From their private conferences, it was obvious that much would have been deducted from these demands, if Charles had not been extravagant in his; and the failure of the negotiation may, on the authority of Clarendon, be ascribed to Charles's fidelity to an unhappy promise which he had made to his queen, to accede to no terms without her intervention, and restore none to favour without her consent.

The parliamentary army took the field next spring 24,000 strong: The campaign of 1643 was, on the whole, unfavourable to them; and, considering the difficulty of raising money among the king's friends by spontaneous

exertions, compared to the facility with which their antagonists recruited their finances by taxes, that success is surprisingly honourable to the royalists. The city of Reading, however, surrendered to Essex, at the head of 18,000 men. In the north, Lord Fairfax, who commanded for the parliament, was dislodged by the Earl of Newcastle from Tadcaster, but the victory proved indecisive. Waller, the poet, distinguished himself on the parliamentary side, by taking Winchester, Chichester, and Hereford. These successes were counterbalanced by victories of the royalists in the west, where, at Bradoe-down, in Cornwall, the Cornishmen overthrew General Ruthven, and chased General Stamford back to Plymouth and Exeter. The return of Stamford's forces under Major-General Chidley, in the same direction from which they had been repulsed, brought on the battle of Stratton, where the parliamentary forces were again attacked by the Cornish royalists, and completely routed. This victorious army, joined by the Marquis of Hertford, and by Prince Rupert with a reinforcement of cavalry, soon after fought a pitched battle near Bath, with the army of Waller, without decisive advantage on either side; but, on the 13th of the same month, they routed and dispersed Waller's whole forces at Roundaway, and drove him into Bristol with only a few horse. That city yielded in a few days to Prince Rupert by capitulation, though not until the attempt to take it by storm had cost the royalists 500 men. The king, at this period, joined the camp at Bristol; and so important were all the advantages he had gained by the defeat of Fairfax in the north, of Waller in the west, the retreat of Essex, and the reduction of Bristol, that a fair opportunity presented of advancing towards a distracted capital. But the parliament was preserved by the destiny which ever attended Charles, whose arms were diverted, by an impulse of sudden indignation, to the siege of Gloucester. The approaches to that town were baffled by the skilful defence of Massey. A general assault was repelled by the desperate enthusiasm of the garrison and city, which was reduced, however, to extreme necessity, when it was relieved by Essex. His return was opposed by Charles at Newbury, where a battle was fought with desperate and steady valour on both sides. Essex's horse were several times broken by the king's, but his infantry kept in firm array, and, besides giving their fire, presented an invincible rampart of pikes against the furious shock of Prince Rupert and the gentry of the royal cavalry. Night put an end to the action, but left the victory undecided. On the side of Charles, but already disgusted at the royal cause, fell the virtuous Lord Falkland. Essex next morning proceeded on his march to London, and, though he had gained no victory, obtained the approbation of parliament.

In the north, during the summer, the Marquis of Newcastle was opposed by Sir Thomas, son of Lord Fairfax, and Oliver Cromwell, two officers who were at this time rising fast into distinction. But the advantages which were gained by the former at Wakefield, in defeating and making a prisoner General Goring, and by the latter at Gainsborough over General Cavendish, who fell in the action, were more than compensated by the rout of Lord Fairfax at Atherton Moor, (on the 31st of July) and the dispersion of his whole army. After this victory, the Marquis of Newcastle sat down before Hull with an army of 15,000 men, but, being beat off by a sally of the garrison, he suffered so much that he

thought proper to raise the siege. About the same time Manchester had advanced from the eastern associated counties, and joined Cromwell; and young Fairfax obtained a considerable victory over the royalists at Horne Castle, where the conduct and gallantry of the two rising associates were eminently displayed. Though fortune thus balanced her favours, the king's party were still superior in the north; and, had not the garrison of Hull kept Yorkshire in awe, they might have joined their forces with those in the south. The drawn battle of Newbury put an end to the campaign of 1643, by obliging both parties to retire into winter quarters.

While the king's arms were, unhappily for his own cause, diverted from London against Gloucester, the parliament was not without alarm from divisions in the metropolis itself. Distinguished as the war had been, most honourably for the English name, by mutual clemency in the field, it was not possible for the new government to maintain itself, without arresting numbers of those who were convicted or suspected of royalty: and we need not wonder that the jails were full, and the very ships in the river converted into prisons. But the zeal of the followers of parliament was not universal. Waller, already mentioned in the wars, an elegant poet, an eloquent speaker in parliament, and a man of great influence from his persuasive address, was induced, either by treachery, or disgust at his party, to project an association in the city for refusing the parliamentary taxes, and obtaining peace with the king. The design was detected. Tomkins, the brother-in-law of the poet, and Chaloner, the friend of Tomkins, suffered death, while Waller saved his own life by confessions not much to his honour, and his sentence was at last changed to a fine of 10,000*l*.

As Scotland could not be indifferent to the issue of the present contest, so neither party could be indifferent to the prospect of her aid. When hostilities had first commenced in England, offers of mediation, which had before been advanced, were renewed by the Scottish council, and by the commissioners whom the late Scottish parliament had appointed as conservators of peace between the two countries, of whom a body proceeded to Oxford. But the royalists refused them a passport to London to try their mediation with the English parliament; they refused them a parliament in Scotland, and dismissed them with indignation.

Instead of a triennial parliament, which could not be anticipated in Scotland, a convention of estates was summoned by the council and conservators of the peace. The object of their assembling was soon announced by their impatient expectation of commissioners from England. These arrived from the English parliament in the June of 1643, when the state of the republican arms made it necessary to implore the fraternal aid of the Scots. The commissioner chiefly trusted among them was Vane, a man who, in an age distinguished for active talents, had no equal in eloquence, address, and dissimulation. By his persuasion, was framed at Edinburgh, that *solemn league and covenant*, which effaced all former protestations and vows taken in both kingdoms, and long maintained its credit and authority. In this covenant, the subscribers, besides engaging mutually to defend each other against all opponents, bound themselves to endeavour, without respect of persons, the extirpation of popery and prelacy, superstition, heresy, schism, and profaneness, to maintain the rights and privileges of parliaments, together with the king's

authority, and to bring to justice all *incendiaries and malignants*. The subscribers of the covenant vowed also to preserve the reformed religion, as established in the church of Scotland; but, by the artifice of Vane, no declaration more explicit was made, with regard to England and Ireland, than that these kingdoms should be reformed according to the word of God, and the example of the purest churches. The Scottish zealots, when prelacy was abjured, took it for granted, from this expression, that their own church was to be the model. But the able politician Vane had other views; and while he laughed at their simplicity, had devoted himself to the maintenance of systems still more dangerous. The solemn league and covenant was received in the Scottish convention and kirk assembly with enthusiasm and tears of joy, and transmitted to the English parliament and assembly of divines at Westminster, where it was received with the same applause, and ordained in both kingdoms to be universally subscribed. By a treaty with the Scottish convention, 21,000 Scotch were to be retained in arms at the expense of England, to be led by their own generals, and to receive orders from a committee of both kingdoms. No terms of peace were to be concluded without the concurrence of the Scotch, who were to evacuate England at the conclusion of the war.

Political choice, as well as religious zeal, no doubt prompted Scotland to take this side in a quarrel, in which the success of parliament threatened much less evil to their nation, than the success of the king; a quarrel too, in which neutrality was as difficult as unsafe. But Charles had, in the mean time, endeavoured to atone for his recent rejection of their mediation, by offers to bribe their loyalty, which, if insincere, were at least magnificent. Among many things, he promised to reannex Northumberland, Cumberland, and Westmoreland, to the ancient kingdom of Scotland. But these offers were counteracted, by the discovery of intrigues, by which the non-covenanting Highland clans under Montrose, were engaged to desolate the Lowlands in the royal cause.

The earl of Antrim, who was to bring the Irish to co-operate in this design, attempted to land at Knockfergus, but was surprised by the Scotch; and the discovery of correspondence found on his person, first revealed the king's intentions to procure a cessation of arms with the Irish Catholics, and to introduce their arms into England. This discovery spread horror and alarm, and more firmly united the English and Scotch. A massacre of the chief Covenanters was projected by Montrose, and was to have taken place at the Countess of Roxburgh's funeral; but the royalists were happily too few to attempt it.

The discovery of the king's intentions to make a truce with the Irish insurgents, and to convert those ferocious enemies into auxiliaries, quickened the military preparations of the Scotch, and impelled them to take the field in the depth of winter, (1643-4). By the victories of Ormond, all the forts which had been either besieged or blockaded by the native Irish had been relieved; and by Ormond's influence chiefly, the justices and council in Ireland had fallen into an entire dependence on the king; so that, excepting a body of Scottish forces, who, for some time, were allowed, by agreement with the English parliament, to defend the British planters in the north of Ireland, it was to Charles's troops that

· VOL. IV. PART II.

the honour of preserving the British name in the sister island was due.

The king, that he might make preparations during the winter for the ensuing campaign, summoned to Oxford all the members of either house who adhered to his interests, and availed himself of the name of a parliament, so passionately cherished by the English. His house of commons amounted only to 140, half of the number at Westminster: his house of peers was twice as numerous as that of his opponents. Such a spectacle of double legislation, was a token of calamity to the nation, which reminds us of *Œdipus*, when he beheld two suns in the firmament. The parliament at Westminster voted the first excise that was ever introduced in England. That at Oxford imitated the example, and granted the king 100,000*l.*, to be levied by loans upon their subjects within his quarters. It was the interest of Charles to declare himself, (whether sincere or not,) continually anxious for peace: it was the interest of the commons rather to be sure of an advantageous peace, than to risk any thing by an unequal treaty. The negotiations, therefore, which Charles preferred before the commencing campaign, were thwarted in the first instance, by his applying to Essex, who refused to assist towards treating, unless the communication were directly opened with parliament; and in the next instance, by the king refusing to acknowledge the houses at Westminster an entire parliament without including those at Oxford. Twenty-one thousand Scotch, commanded by Lesly, earl of Leven, and guided by a committee of the two nations, marched to support the parliamentary cause, in the depth of winter; and crossing the Tweed amidst severe frost and deep snows, sent an ineffectual summons to the town of Newcastle. Then passing the Tyne, they faced the Marquis of Newcastle, who lay at Durham with 14,000 men. The regiments which Charles had procured from Ireland, reduced some fortified places in Cheshire, and invested Namptwich; but young Fairfax advanced to relieve it, and totally ruined and dispersed the Irish auxiliaries. He then joined his father, Lord Fairfax; and their joint forces defeated Colonel Bellasis at Selby, whom Newcastle had left to protect one approach to his army; so that the Marquis, for fear of being inclosed, was obliged to retire to the defence of York, and to permit a junction of Fairfax with the Scotch. Their united arms seemed insufficient to reduce York, till the arrival of Manchester (lately Kimbolton) with a third parliamentary army. Even then, the three armies contented themselves with a slight blockade; but on the approach of Prince Rupert with 18,000 royalists, Manchester, Leven, and Fairfax, abandoned the siege, and prepared for battle on Marston Moor. By a most dextrous movement, or rather concealment of his movements, Rupert crossed the Ouse, threw his military stores and provisions into York, and joined his forces with those of the Marquis of Newcastle. If contented with this exploit, he had listened to the advice of Newcastle, and remained on the defensive till another expected reinforcement arrived, the triple army would have probably much diminished; the king's army, at all events, would have been saved; but impelled by a rash spirit, Rupert gave orders for battle. His forces occupied Marston Moor, those of his opponents extended along the adjacent fields; both sides were nearly equal in number; and it was observed, that, for the first time in the 17th century, 50,000 British subjects were

4 C

drawn up for mutual destruction. The signal for close combat was given in the evening, after an ineffectual cannonade across a bank and ditch that intervened between the armies, and after a silence of suspense which succeeded on both sides, in expectation of mutual attack. Cromwell and David Lesly surmounting the mound, broke the right wing of Rupert, dispersed his own cavalry, and destroyed part of his centre. Fairfax the younger was beat on the other wing of the parliamentary army, by the irresistible charge of General Hurry, who also cut up a reserve of the Scotch infantry. But while the royalists were pushing on to the baggage of their opponents, Cromwell and Lesly wheeled round, and the battle was restored, after both armies had reversed their front, and exchanged their ground. The shock was short, bloody, and decisive; the royalists were entirely routed. By Lesly's three Scottish regiments, and Cromwell's iron brigade, this eventful victory was won.

Rupert retired with his shattered forces into Lancashire, York surrendered to the victors, and in that city Lord Fairfax established his authority over the whole county. While the Scottish army marching northward, joined Lord Callender with new forces, and took Newcastle by storm.

The campaign in other parts of the kingdom presented great vicissitudes of fortune. Waller, after having defeated the royalists in the south, under General Hopton, turned to Oxford, where the king was already pressed by Essex; but the king escaped by a nightly march to Worcester, leaving some troops in Oxford, which, for the present, were not molested, as Essex proceeded against Prince Maurice into Cornwall, and left the king to Waller. Charles, whose measures were taken wisely, either by his own contrivance or that of his general, Ruthven, suddenly rejoined his foot at Oxford; and Waller, who was stunned by a check which his troops sustained on the Charwell, as well as by the recall of his London auxiliaries, allowed the king to pursue Essex, who was soon enclosed between Charles's troops and those of Maurice, and his army reduced to surrender their foot, artillery, and baggage, while his cavalry, with difficulty, broke through the lines of their surrounding enemies, and the general himself escaped to Plymouth.

Though Essex appeared to have despaired of the public cause, the parliament wisely expressed their opinion of his fidelity after this disaster: and as no stipulation had been made, that the troops who had been taken and dismissed by Charles, should not serve again, they were equipped again in six weeks. The generals Manchester, Cromwell, Waller, and Middleton, and the soldiers of Essex, (for Essex himself was unfitted by sickness for commanding them,) gave battle to Charles at Newbury, which became a second time the scene of bloodshed. Night alone prevented the king from a total overthrow. His ordnance was deposited in Dennington Castle, as he continued his precipitate retreat to Oxford; but within a few days he returned reinforced by Prince Rupert's arrival from the north, and, in presence of a victorious army, withdrew his artillery, and distributed his troops into winter quarters.

The war in Scotland was supported on the side of royalty by the single ability of Montrose. That active leader, with a few troops collected in Westmoreland, made at first an unsuccessful attempt to erect the royal standard at Dumfries. Retiring to Athol in disguise,

with only two attendants, he was met by a body of Irish who had been sent over from Ulster by the earl of Antrim, and had already ravaged the coast of Argyle. At the head of these, and of his Highland adherents, who flocked immediately to his standard, he gave the Covenanters a sanguinary defeat, first at Tippermuir near Perth, and after obtaining possession of that city, another at the bridge of Dee. Aberdeen fell into his hands, which he gave up to pillage and slaughter. Argyle, who was his chief antagonist in the field, could not prevent him from descending, by rapid marches, into the remote recesses of Argyshire, and extending his devastations over Braedablin, Argyle, and Lorn, to the confines of Lochaber; but, baffled by his superior boldness and skill, fled by sea to escape being involved in the ruin of his clan.

Negotiations for peace were renewed in England. Although the parliament, by their late answer to the king's propositions from Oxford, held out the most rigorous offers, and a list of proscriptions; yet the rising power of the Independents made it now the interest of many of the Presbyterians to conclude a peace, if it could be obtained with security. Sixteen commissioners from Charles, twelve from parliament, and four from the Scotch, assembled at Uxbridge. The treaty was limited to three subjects,—religion, the militia, and Ireland. On the first head, the king's opponents required prelacy to be abolished, and the acts of the assembly of divines at Westminster to be confirmed, and the solemn league and covenant to be taken by the king, and universally enjoined. Charles refused their propositions, and the reformations in episcopacy which he offered to concede appeared insignificant to the opposite party. On the second head, parliament reduced their demand of managing the militia, to seven or three years after peace, when it might be again adjusted, and proposed an act of mutual oblivion. On the subject of Ireland, the parliament required, that the cessation of arms should be declared void; that the Irish war should be directed by them, and no peace concluded without their consent. Charles would make no concession on this point; no offer of compromise, nor attempt to make his own pretensions approach nearer to those of the parliament, came from his side. On the contrary, his commissioners studiously obstructed a conclusion. The earl of Southampton, one of them more faithful to his interests, knelt and implored him to yield to the necessity of the times. His assent was obtained to the most material propositions; but the news of Montrose's victories in Scotland made Charles recal this assent; and reliance on this partizan, together with the hopes of 10,000 men under the duke of Lorraine, for which the queen had negotiated, were the chief causes of the failure of a treaty, in which Charles's letters to the queen shew him to have been insincere.

Montrose continued for a time to brighten the royal cause, by the delusive hopes of his splendid achievements. He had retired to Inverness from laying waste Argyshire, when Argyle recalled his scattered clan to Inverlochty, a castle at the western extremity of those lakes which almost cross the Highlands from east to west. The earl of Seaforth, with 5000 men, pressed Montrose on the other side; but, by a rapid movement, Montrose fell upon the covenanters at Inverlochty. Argyle, seized with a panic, deserted his army, and fifteen hundred of them were slaughtered on the scene of battle. Montrose was joined, in consequence of this victory,

by several new clans of the Highlanders; and the army of lord Seaforth, consisting of raw levies, was dispersed by the terror of his name. Recrossing the Highlands, he abstained, indeed, from the cold blooded massacres which had disgraced his former campaign; but refusing mercy to all who did not assist his cause, he pillaged and burnt their habitations wherever he marched.—Elgin, Cullen, Banff, and Stonehaven, experienced his cruelties; the last of these places was consigned to the flames, by his order, amidst the cries and intreaties of its inhabitants. He had carried Dundee by assault, when Baillie and Ury, two officers of the covenanting army, who had been recalled by the council of Edinburgh to protect the country, approached him. He made an astonishing retreat of 60 miles in one day, before their superior forces, who divided in pursuit of him. Ury met him with 4000 men at Alderne, near Inverness, where Montrose, posting one wing upon strong ground, and affecting to have a central body by disposing a few men among trees and bushes, led on the rest of his troops to a furious charge, and put to flight the Covenanters, mounting to twice his numbers. Baillie advancing to avenge Ury's defeat, met with a similar fate at Alford, and the victorious royalist was preparing to push his conquests to the south of Scotland, and to dissipate the parliament, which had been ordered to meet at St Johnstons.

By the influence of the Independents, that body of the English parliament and its followers, who wished for an abolition of all church government, and a levelling equality of ranks in the republic, a self-denying act was passed in the House of Commons, by which the members of both Houses were excluded from all civil and military employments, except a few offices which were specified. The pretence of this act was to convince the people, that the members of parliament wished to participate in none of the profits of government, or avail themselves of the power which had been intrusted to them: the real object of its contrivers, which the Presbyterians did not sufficiently perceive or resist, was to get rid of a number of officers, whose weight was a restraint upon the levelling enthusiasm of the Independents. Essex, Warwick, Manchester, Denbigh, Waller, and Brereton, resigned their commands, and received the thanks of parliament. The command of the army was bestowed on sir Thomas Fairfax—a man sincere, disinterested, and able in war, but of narrow genius in every thing else, and unconsciously made subservient to the deep dissimulating views of Cromwell. After obtaining, in concert with sir Harry Vane and the other leaders of the Independents, this self-denying ordinance, Cromwell contrived to make Fairfax retain him in the command second to his own, or, in effect, to give him the first influence in military affairs. The armies, in consequence of the ordinance, were modelled anew, and an exact and rigid discipline was established. As the new officers were chiefly Independents, in whom the spiritual and military vocations were united, the soldiers were daily edified by exhortation and prayer; when they marched, the fields resounded with psalms, and wherever they were quartered the pulpits were usurped by those military rhapsodies, whose martial devotion reduced the feeble notes of the clergy to contempt. The soldiers were seized with the same rage for preaching and praying. Little success was expected from the raw officers of the new-modelled army, but their enemies were disappointed.

On opening the campaign at the approach of the summer of 1645, the king marched to relieve Chester, and Fairfax to relieve Taunton. The siege of Chester was raised on the report of the king's approach; that of Taunton was continued. While Fairfax was recalled by the committee of both kingdoms to attack the city of Oxford, the Scottish army was directed to advance, and oppose the king in the north. They advanced to Rippon, and learning that prince Maurice intended to co-operate with Montrose, they turned into Westmoreland to cover the siege of Carlisle, and to prevent the danger of their native country. Leicester, for the present, attracted the king's arms; that city was stormed with great carnage, and given up to the most dreadful excesses of the soldiery. The disaster excited such clamour, that Fairfax was ordered from besieging Oxford, to march against the king; and either from necessity, or the impetuosity of prince Rupert, it was resolved, on the part of the royalists, to give battle without waiting for some expected aids.

The battle of Naseby was fought between nearly equal numbers. Prince Rupert first broke the opposite wing of the enemy, but pursued too far. Cromwell bore down the wing of the royalists opposite to his own, but wisely left a detachment to pursue them, and turned upon the centre, where the royal infantry and Fairfax were continuing a doubtful combat. When Rupert returned, the battle was irretrievable. The king called out, in vain, to make but one charge more, and the day was their own; but his artillery and baggage were lost, and his infantry ruined. Fairfax improved the victory by uninterrupted successes; Leicester, Bath, Bridgewater, and other strong places, fell rapidly into his hands. Prince Rupert, who had thrown himself into Bristol, surrendered the place while the walls were entire; after which, the victors dividing, Cromwell reduced the Devises, Winchester, and Basinghouse; and Fairfax turning westward, captured the towns of the royalists, and surrounded their fugitive army in Cornwall.

The king, who had fled after the fatal field of Naseby with the remnant of his cavalry into Wales, returned with the fruitless design of joining Montrose in Scotland; but as every avenue to the north was shut against him, his last effort was to relieve the city of Hereford, besieged by the parliamentary forces, who were deficient in cavalry to cover the besieging army. Attempting to relieve Chester, also, he was defeated by general Doyntz, and after again escaping into Wales, he returned to Oxford in despair.

Montrose, who gained two brilliant victories over the Covenanters at Alford and Aldern, was, at this time, the forlorn hope of the royal cause. Descending from the mountains after these victories with 6000 men, he advanced across the Forth, marking his progress with butchery and devastation. Baillie opposed him at Kilsyth with equal numbers; but a battle took place, in which no quarter seems to have been given to the Covenanters, and they lost above 4000 out of 6000 men. Presuming in his success, Montrose advanced to the borders of Scotland, though with numbers diminished by the retreat of the Highlanders, who went to secure their plunder among the hills, and was surprised and defeated by David Leslie, within a mile of Selkirk, among the woods of Philiphaugh. He escaped with difficulty, attended by 200 horse, and secured himself among the fastnesses of Athol; but his reputation was ruined

among the Highlanders, and his chief followers, after the slaughter of his army, were consigned to the scaffold.

To conclude the misfortunes of this campaign, the unpopular aid of the Irish Catholics, on which Charles had so much relied, was not only disappointed, but prematurely exposed to public hatred. The titular Catholic bishop of Tuam, having been killed by the Scotch at Sligo, a paper was discovered upon his person, containing articles secretly concluded between the king and the Catholics; so likely to be offensive to English protestants, that it was thought unfit that Ormond, the king's lieutenant in Ireland, should appear in the transaction. By these articles, the possession of the church, and its revenues in Ireland, were to be given to the Catholics, who, in return, were to supply the king with 10,000 men. Glamorgan, an Irish peer, had been commissioned by the king to make these terms with the Catholic leaders; but they were not to be acknowledged publicly for the present. Glamorgan was arrested by the king's orders, when the articles were first found; and the king's knowledge of the treaty, which was declared to be a forgery, is still denied by the writers in Charles's favour. But the silence of Clarendon on the subject, and his expressions in his private correspondence, as well as the whole aspect of the business, make it incredible that Charles did not conclude the treaty, whatever might be his intentions with regard to fulfilling it.

Fairfax was approaching with a powerful force to Oxford, when Charles, who had no choice but to escape or be surrounded, adopted the resolution of flying to the Scottish army. To every proposal which he had sent the parliament of treating for peace, they had answered, that they were preparing bills, of which his acceptance would afford the surest pledge of his desire to surrender. This was indeed bidding him surrender at discretion; but after the transactions which have been recorded, what terms approaching to equality could Charles expect? With two attendants, Dr Hudson and Mr Ashburnham, and disguised as the servant of the latter, Charles reached the Scottish camp at Newark, having passed through several cross roads, and having once approached so near to London as Harrow on the Hill, not without some thoughts of entering his capital, and trusting to the generosity of the parliament. This resolution, though adopted in desperate circumstances, was still connected with hopes of dividing his enemies, and of profiting by dissensions, of which few princes, in such a situation, would perhaps have failed to avail themselves. The Presbyterian church government, sanctioned by the assembly of divines at Westminster, and by the general assembly of Scotland, had been adopted in England; but the parliament refused to render the church supreme and independent of the state. The Independents combined with the Erastians in parliament, to procure a charitable indulgence of conscience, which the English, as well as Scotch Presbyterians resisted, as incompatible with the covenant. Besides this, there were causes of deep offence to exasperate the Scotch: their pay and supplies were long neglected; their cautionary garrisons in the north were demanded back; and their free quarters were refused. Since the battle of Naseby, the Presbyterian, and with that the Scottish influence, had declined in England. Charles had already maintained secret negotiations with the two factions. In a confidential letter to lord Digby, he expressed his ex-

pectation of "drawing either the Presbyterians or the Independents to side with him for extirpating each other, so that (says he) I shall really be king again."

In an intercepted letter, written by the king to Ormond, Charles was found to declare, that he threw himself on the Scottish army, on the assurance of their assistance to restore his prerogative, and to join with Montrose, and compel the English parliament to peace. There is extant, on the other hand, a declaration of the Scottish commissioners, disclaiming, in the strongest terms, any public or private agreement whatsoever with the king. This was open, if a falsehood, to immediate detection. An agreement, it is true, had been concerted by the means of Montreville, the French ambassador, in which the English Presbyterians were consulted, by which the Scotch were to escort their monarch to their camp; but the treaty was broken, by the Scotch refusing to co-operate with Montrose, and by the want of the king's explicit promise to confirm the Presbyterian church. It may be believed, therefore, that the Scotch were sincere in their declaration to the English parliament; that Charles came among them, in consequence of no stipulation on their side to take part with him against their ancient allies; and whatever discontents might have arisen with England, such a stipulation to support Charles, without his unequivocal promise to grant them the objects for which they had taken arms, would have been at best romantic impolicy. The Scotch continued, therefore, steadfast to their original engagements; and though they withdrew to Newcastle, to prevent their return home being intercepted by the English, they obtained Charles's order for the surrender of Newark, they guarded his person with vigilance and cold respect, and professed their resolution to avail themselves of the possession of it, to obtain their desired uniformity of religion, and a durable peace.

After Charles's flight, Oxford speedily surrendered to Fairfax; and the civil war was ended at the distance of 4 years from the time when the king's standard was first erected at Nottingham.

The surrender of Charles's person to the Scottish army, was followed by negotiations between the Scotch and English, for the payment of arrears due to the former, which were settled, after many deductions, at 400,000*l.*, and for the delivery of the king into the hands of the English. These two agreements have been perpetually identified by historians, but they were, in fact, distinct. The amount of the arrears was adjusted in August; the disposal of the royal person was unsettled in November. In that month, the Scottish parliament, indignant at a vote passed in September, (a month after the settlement of the arrears,) by the English parliament claiming the sole disposal of Charles's person, resolved to maintain the freedom of their king, and his right to the English throne; but they retracted this vote, upon just consideration, that it was abandoning their solemn league and covenant, taken in concert with the English Presbyterians, unless they obtained his consent to their joint demands. They offered to reinstate him on his throne, and to obtain for him a just settlement with his English subjects, provided he would take the covenant; and commissioners were appointed from the estates in Scotland, to signify to his majesty, that on no other terms could he expect a reception in Scotland, or assistance from the Scottish people. The Duke of Hamilton, one of his chief friends in Scotland, concurred with his ministers in representing, that this alone would save him;

that if he conceded the Presbyterian church to the two kingdoms, the demands respecting the militia would be relaxed, that all Scotland would declare in his favour, and few in England would venture to oppose granting him a limited power, while the Presbyterians continued still numerous and powerful. The king was inflexible to their propositions. On the eve of his departure, the commissioners earnestly renewed their offers to conduct him to Berwick, and procure more equitable terms from the English parliament, if he would accede to the covenant; and a large bribe was offered to Montreville,* to obtain even a bare promise of his compliance with their religious demands. Charles would grant no promise of the Presbyterian church but for three years, and in giving this concession, justified it to his own conscience before two of his bishops, by his firm resolution to recover and maintain Episcopacy. Let us respect the king's conscience, but let some allowance also be made for the conscience and common sense of those who had him in their power. He had thrown himself, indeed, on their generosity, but not without designs of detaching them, by national prejudices, from their common cause with the English, at the hazard of involving them in a bloody war. It had been urged, indeed, as a disgraceful circumstance against the Scotch, that the English parliament still retained their arrears, as a punishment in reserve, had they broken terms with them. If the case had so stood, that their refusal to surrender Charles would have been punished only by defrauding them of the money, the charge might have been well alleged, that they sold Charles for prompt payment. But the Scotch could justly plead, that the loss of the arrears was a trifle, in comparison with the misery, the bloodshed, which must have ensued from drawing the sword in Charles's defence, without securing the objects of the covenant. They offered all that could be offered, as the just terms on which they were willing to retain the king, or, in other words, to defy the hostilities of England. By his refusal it was shewn, that if they had conquered England in his cause, they were only sure to rivet the chains of Episcopacy and tyranny on themselves.

The king having been delivered over to the English commissioners, was conducted under a strong guard to Holdenby in Northamptonshire, and rigorously debarred from the visits of his friends and family. The Presbyterians in the English parliament had now no enemy to fear but the army which had fought for them; who having shewn their power at the secret instance of Cromwell in refusing a purposed expedition to Ireland, set up a military parliament of their own, called the *agitators*; while the principal officers composed a council to represent the body of peers. As the first token of mastery, the agitators obtained possession of the king's person; Joyce, a cornet of dragoons, having seized him at Holdenby castle. Fairfax, who sent two regiments to restore him to the parliamentary commissioners, could not get him back; and the king's speech to Fairfax on this occasion leaves room to suspect, that he was privy to the arrest. Cromwell, who was secretly at the bottom of the design, came to the army next day, and received from the agitators the chief command. The parliament tried alternately, but in vain, both submissive and bold measures to diminish the power of the military; who, after advancing to St Albans, at last demanded the

expulsion of Hollis, Stapleton, and other leading Presbyterians to the number of eleven, from the House of Commons, and a general right of new modelling the government and settling the nation. It was to no purpose that the citizens of London rose to defend their legislature, while the city militia were called out, and the works of the city manned. A minority of 62 members in the interest of Cromwell, escaped to the army at Blackheath, who brought them back in triumph, expelled the eleven Presbyterians whom they had formerly impeached, sent the mayor of London and the leading aldermen and officers of the city militia to prison, razed the lines about the city to the ground, and reduced every thing to obedience.

The change of the possession of his person was at first favourable to the king's treatment, and might have been useful to his interests, had he been faithful to them himself. Cromwell and Ireton offered him terms, in which it was neither required that episcopacy should be abolished, nor the militia entirely detached from the crown: the king objected to the want of positive security respecting the church, and to the exception of seven persons from amnesty, whom it is clear that he could have well rewarded, had they been driven to exile. "You cannot," said Charles to the Independents, "you cannot do without me; you will fall to ruin if I do not sustain you." This, it is true, was but a temporary obstinacy, but his hopes were for ever blasted: The Independents, by the disclosure of an intercepted letter to the queen, in which the insincerity of his offers to that party were avowed, as well as his intention to close with the Scotch, with whom, as with the English Presbyterians, he had been maintaining a negotiation at the same time.

His situation at Hampton court became every day more irksome and formidable after the failure of this treaty with Cromwell and the leaders of the army. Prompted by this inquietude, he escaped on the 11th of November, with three attendants, Berkely, Ashburnham, and Leg, and travelling all night reached Titchfield next day, where it was impossible he could be concealed. Having attempted in vain to escape by sea, he was obliged to entrust his personal safety to Hammond, the governor of the Isle of Wight, a man notoriously dependent on Cromwell, who conducted him to Carisbrook castle, with demonstrations of respect, but in reality as a prisoner. During the king's confinement in this forlorn situation, the rising power of Cromwell was threatened by the turbulence of his own instruments, the agitators of the army, who began to project the wildest forms of popular government. But the levelers, (so they were called,) were speedily cured of their enthusiasm, by the rough, but dextrous hand of Cromwell, who, after drawing the whole army out in review, put himself at the head of some faithful troops, boldly seized the ringleaders of the mutineers, and by a severe example reduced the rest to obedience. An opportunity was embraced by Charles to renew his correspondence with the general officers, but his emissary was received with contempt.

Charles began a new negotiation with the parliament, by communicating in a message from Carisbrook castle, an offer to resign, during his own life, the power of the militia, and the nomination to all the great offices of state, provided that after his demise, these prerogatives should revert to the crown. The parliament were now

* The king's French confidant.

certainly subservient to Cromwell, the Independents, and the army, and their treatment of this affair was severe, as might be expected, from the victors to the vanquished.

They returned him four proposals as preliminaries to all treaty; that the command of the militia should be vested in the two houses for twenty years, and should not be exerted afterwards without their consent; that the peers created at Oxford should be deprived of their titles; and the parliament be empowered to adjourn from place to place. These terms were severe; but since the covenant was omitted, and the church reserved as an article susceptible of future modification, they at least spared the king's conscience in point of religion. Instead of closing with these preliminaries, Charles, who was not so closely watched at Carisbrook castle but that he could maintain a clandestine treaty with the Scotch, secretly agreed with their commissioners to confirm the covenant in parliament, and to establish the Presbyterian church, till it should be revised by the assembly of divines. The Scotch, in return, engaged to assert and restore his authority by arms; the aid of the Presbyterians in England, of Ormond in Ireland, and of the English royalists, was expected. When the English commissioners received his refusal to the preliminaries, his guards were redoubled, and a resolution was adopted at the instigation of the Independents, that in the settlement of the nation no farther addresses should be made to Charles, nor any applications received from him. He was in effect dethroned.

This treaty of the Scotch with Charles was afterwards called the Engagement; but though discontents had multiplied between the two kingdoms, it was found no easy matter to impose the engagement on the whole nation. The Scotch royalists under Traquair and Callender, (Montrose being absent,) were impatient for action; the moderate Presbyterians, under the Duke of Hamilton, wished to restore the king and the power of the English Presbyterians. Argyle, at the head of the wild Presbyterians, and seconded by the church, denounced the engagement as a deadly breach of the covenant, and protested against hostilities with England. Hamilton was appointed general of the new levies for the invasion of England, as David Lesly and the other officers could not act without the church's sanction. In the mean time, the English royalists and Presbyterians, now uniting against their military tyrants, rose in Wales, and in Kent, and Essex. In the former part of the country, they were overwhelmed by Cromwell, in the latter by Fairfax. But during the absence of the army, the Presbyterians resuming their freedom in parliament, opened a last treaty with Charles. Hamilton, an incapable leader at the head of an undisciplined army, entered England, but durst not unite his forces with those of the royalists under Langdale, because the latter had not taken the covenant. Cromwell did not fear with 8000 men, to attack their superior, but divided forces. Of Hamilton's army, only a small body under Callender, who disdained to surrender, made their escape back to Scotland. New levies were raised by the Earl of Lanark, Hamilton's brother; but the Earls of Argyle and Lothian, in the Highlands, and Cassilis and Eglington in the west, march-

ed with their wild Presbyterians to Edinburgh, and inviting Cromwell, now victor on the borders of England, to the metropolis, conducted him thither in triumph; and suppressing the engagement made by their countrymen with Charles at Carisbrook Castle, renewed with the English general the solemn league and covenant.* In the absence of Cromwell, the treaty between Charles and a parliament unintimidated by military power, continued to proceed. After a long delay, he agreed to surrender the militia, the chief offices of state, and the government of Ireland for twenty years; to accept of 100,000*l.* for the court of wards to acknowledge the parliamentary great seal, and to consult the two houses in the creation of peers. However willing that the royalists should compound for their sequestrated estates, he refused to allow the proscription and exile of seven faithful adherents, whom the parliament excepted from amnesty. If ever we revere "*his grey disrowned head*,"† it is for this refusal, dictated by the remembrance of Strafford. His refusal to concede the abolition of Episcopacy, was another point on which he split with parliament in this last chance for safety and the peace of his country. When we recollect the conduct of Henry IV. in a similar situation, and that he lost no esteem for probity as a man, nor for gallantry as a hero, by a public profession of a religion repugnant to his heart, we cannot but wish that Charles, to use the words of a spirited historian, had preferred the public welfare and his own interest, to the vain and perishable forms of religion. But allowing all propriety to his scruples, the merit of Charles is done away, even in this point, by the discovery, from his own correspondence, of his being utterly insincere in the treaty. His secret, but fixed intention, was to escape to Ireland and renew the war. In one letter, he thus describes his motives to the Scottish treaty: "To deal freely with you, the great concession I made to-day, was merely in order to my escape, of which, if I had not hopes, I would not have done; for then I could have returned to my straight prison without reluctance; but now, I confess, it would break my heart, having done that which nothing but an escape could justify."

Before this protracted treaty could be finished, the army returned exasperated by a second civil war, and breathing vengeance against the king, whom they considered its author. They demanded justice, not on meaner delinquents, but on Charles himself. His person was again seized by the army, and removed from Newport to Hurst Castle, on the opposite Coast. The commons, although they had voted his concessions unsatisfactory, now made a last effort in their own defence, and in that of Charles. They voted that his concessions were satisfactory. But next day Colonel Pride, at the head of two regiments, blockaded the house, and excluding by violence about 200 members, and leaving only 60 determined Independents, enforced a vote that the late concession to Charles had been illegal, and that their general's conduct was just and necessary. This violence upon parliament, was called Pride's purge, and the remnant of voters were called the rump parliament. To this assumption of government by a lawless and military power, the awful and unexampled spectacle of a king publicly tried and condemned, by a court of his own

* This expedition of the Covenanters to Edinburgh, was called the Whigamore's inroad, from a word employed by the western peasants in driving horses, the origin of the appellation Whig, of which British patriots have been so proud. According to others, the Covenanters were called Whigs, from whig or whey, their customary drink.

† A truly pathetic expression used in his verses at Carisbrook Castle.

subjects, closely succeeded. The interval from the 6th to the 20th of January 1649, was spent in preparations for his trial. A high court of justice was appointed by ordinance, consisting of 133 persons, named indifferently from the commons, the army, and the citizens, noted as well affected to the commonwealth. Bradshaw was appointed president, Coke solicitor for the people of England. The court assembled in Westminster hall. Charles was conveyed from Hurst Castle to St James's. After he had been conducted by the mace bearer, to a chair placed within the bar, he arose, without deigning to uncover or show any respect for the court; and when arraigned by the solicitor, he touched his shoulder thrice with his cane, and admonished him to desist. He was accused of waging and renewing war against the parliament and the people; to establish tyranny instead of the limited regal power, with which he had been intrusted. When his defence was required, he demanded by what authority they sat upon him in judgment; said that he was responsible to God alone; that he was their lawful and hereditary sovereign; that he had been seized by a military force in violation of public faith, while engaged in a treaty with the two houses; that the Lords had not concurred in this violence, and that the Commons, in whose name he was accused, themselves had been subdued by force of arms. That allowing the people had a right to try him, their consent ought to be obtained from the highest to the lowest; and, finally, that refusing to plead before an unlawful court, for actions which he could easily vindicate, he spoke not for himself alone, but in the name of the people of England. Thrice he was produced at the bar, and thrice denied the authority of the court. The evidence of his appearing in arms against the people was then gathered; and after his last request to have a conference with the two houses was refused, (it was supposed for the purpose of resigning his crown to his son,) sentence of treason was pronounced upon him, that his head should be separated from his body on the third day.

France, Holland, and the Scotch, interested themselves to avert his impending fate; the Presbyterians raised a feeble cry in his behalf.

Charles behaved, during the whole trial, with all the dignity that became him as a man, a Christian, and a monarch.* Dr Juxon, late bishop of London, attended his devotions. He was lodged at St James's, and the front of Whitehall was selected as the place of his execution. On the morning of the fatal day, he rose at an early hour after an undisturbed repose, and having concluded his devotions with the eucharist, was conducted on foot through the park, which was lined with guards, to Whitehall, where an apartment was prepared for his reception. After a slight refreshment he ascended the scaffold, and surveyed, without emotion, the awful preparations for death. Despairing of being heard by the multitude, (as the scaffold was surrounded to a great depth with troops,) he addressed his discourse to the officers and attendants. He protested that the war on his part was strictly defensive, and without accusing parliament, he blamed the intervention of wicked instruments. His death, he confessed, was a merited retribution for consenting to Strafford's. He forgave his enemies, admonished the people to return to loyalty, and attesting his dying attachment to the English church, laid his head on the block. An executioner, who wore

a vizor, severed his head from his body at one stroke. Another in the same disguise held it up to the spectators, whose sobs and lamentations were intermixed with the acclamations of the soldiery.

Whilst the general propensity of the English to monarchy, and of men to pity royal misfortunes, was excited by this tragical event, the republican spirit, on the other hand, misguided by fanaticism, began to threaten the wildest excesses; and sects arose under the name of Levellers, Millinarians, and Antinomians, whose object was to abolish all the forms of government and rights of property. But the civil and military power acquired by Cromwell, was built sufficient to restrain those turbulent spirits. (See CROMWELL.) Soon after the king's death, the House of Peers was abolished as useless by the commons; and it was voted high treason to acknowledge the son of Charles his successor in the throne. The first year of freedom was inscribed on the new great seal of England; and public business was transacted by those who were called, the keepers of the liberties of England. A council of 38 performed the functions of the executive, and digested all business preparatory to laying it before parliament. It was declared, (and probably with sincerity by many of those,) that they intended to settle a new representative, and restore liberty to the people.

The Scottish nation was invited to form a confederate republic; but irritated at the fate of Hamilton, who was executed after the victory of Cromwell, and at the many indignities offered by the independents, they acknowledged Charles II. as their king. As Argyle and the strong Covenanters still predominated in Scotland, they made their loyalty conditional to the king's good behaviour.

Ireland demanded more immediate efforts. After the cessation between the late king and the Catholics, war had been kept alive by the parliamentary and Scotch Protestants; but while Ormond rested secure in his compromise with the council of Kilkenny, the Pope's nuncio assumed an active influence over the bigotry of the ancient natives, turned his arms indiscriminately against Ormond and the other Protestants, and obliged Ormond to submit, for his own preservation, his royal garrisons to Jones, the parliamentary general. The Earl of Clancricarde, however, forming a party among the loyal Catholics, succeeded in chasing the nuncio out of the kingdom, and recalled Ormond, who had fled to France. Ormond, in spite of many difficulties, raised an army of 16,000 men, recovered Dundalk, Newry, Tredah, and other forts from the republicans. Affairs were in this state, when Cromwell, who was nominated to the government of Ireland, was for a short time detained by the mutinous spirit of the Levellers in his own army. Four thousand of these assembled at Burford, who were seduced by the appearance of a treaty; but being attacked while unprepared for defence, 400 were taken prisoners, and after some severe examples, the mutinous spirit gave way.

Cromwell first detached a strong force to Ireland to the support of Jones, who was threatened in Dublin by the besieging army of Ormond. By a fortunate sally, the parliamentary general obliged his antagonists to raise the siege, and Cromwell soon after arriving in the Irish capital, was welcomed with general rejoicings. The progress of Cromwell's arms was rapid, bloody, and ir-

* See the article CHARLES.

resistible. He first stormed the garrison of Tredah, which he butchered to one man: he next made a similar massacre at Wexford. Every town before which he presented himself, surrendered in terror at these severe examples; and when his forces were beginning to decay from sickness and difficulties, they were recruited by the voluntary desertion from all the English garrisons in Munster. Ormond despairing of the cause, fled, and left the management of the Catholics to Clanricarde, who was glad to bargain for banishment. Forty thousand native Irish were allowed by Cromwell to pass into foreign service.

The offers of the Scottish parliament to receive the young Charles as their sovereign, were renewed to the Prince at Breda; but as Charles had already enjoined Montrose to make a descent in his favour by force of arms upon Scotland, he protracted the treaty with duplicity, till he should know the result of the enterprise. Montrose, with arms and money furnished by Sweden and Denmark, and about 600 Germans, arrived from Hamburgh on the Orkney isles, and by a forced levy on the poor islanders, raised his army to 1400. The northern Scotch remembering his cruelties, fled with horror before his standard. Advancing beyond the pass of Invercarron, he was surprised, surrounded, and conveyed to Edinburgh. He was there doomed, by a sentence pronounced on his former attainder, to be hanged on a gibbet 30 feet high, and his limbs were stuck up in the principal towns of the kingdom. His defeat was productive of only a further limitation, or rather explanation of the former condition offered by the Scotch to their king. Charles no longer refused to accept the conditions, and receive the covenant (if required,) on his arrival, and embarking with his court in a Dutch fleet, arrived at the mouth of the Spey. As the jealousy of the Scotch was increased by the late invasion, the covenant was exacted from him before he was suffered to land. His English attendants, all but a few complying persons, were dismissed, and he soon found that he had only exchanged exile for imprisonment. He was surrounded by the clergy, who approached his person in the humblest postures, but with exhortations full of bitter invectives against the iniquity of his father's house, the idolatry of his mother, and his own connexion with inveterate malignants. He listened to their sermons, and tried to follow their observance of the Sabbath with all his gravity, but neither disgust nor insincerity could entirely escape the notice of his attendants.

The Scotch were disappointed in their expectations of maintaining peace with Ireland, by observing neutrality. Cromwell, after Fairfax had conscientiously refused to draw his sword against his Scottish brothers of the covenant, received the command of the troops, and was within a month, from the time of the king's arrival, on the banks of the Tweed with 16,000 men. Argyle, at the head of the committee of estates, made the most vigorous preparations for his reception. Lesly, a general who had never been beaten, opposed his cool sagacity to the genius of Cromwell. He entrenched himself in a fortified camp between Edinburgh and Leith, and wasted Merse and the Lothians, to deprive the English of subsistence. Cromwell tried every expedient, without success, to bring Lesly to a battle. The king came to the Scottish camp, where his presence

exciting the jealousy of the fanatical clergy, they ordered him immediately to leave it. They also purged it of 4000 Malignants and Engagers,* the soldiers of chief credit and experience in the nation; and being now an army of saints, concluded they could not be beaten. They murmured at their prudent general. They murmured also at the Lord, for his delays in delivering them, and plainly told him, that he should no longer be their God, if he would not save them from the sectaries. An advantage having offered to Lesly on Sunday, they would not suffer him to take it for fear of Sabbath-breaking. Cromwell was in a bad situation, straitened for provisions, and reduced in numbers by sickness, he retired to Dunbar. Lesly followed him, and encamped on the heights of Lammermuir above the town, taking possession of the passes by which the enemy could retreat to Berwick. The English general had come to the desperate resolution of sending his foot and artillery by sea to England, and of breaking through with his cavalry to Berwick. But the madness of the Covenanters snatched a bloodless victory from Lesly, when he was on the eve of seizing it. The ministers, who had been wrestling, (as they termed it,) with the Lord in prayer, fancied that they had at last obtained the victory, and forced their general, in spite of his remonstrances, to descend to the plain and attack the English. When Cromwell discovered, through his glass, an unusual movement in the Scottish camp, "they are coming down!" he exclaimed, "the Lord hath delivered them into our hands." They continued, during a tempestuous night, to descend from the hills: their matches were extinguished, and their undisciplined numbers were exposed to the skill of veteran troops, who had been carefully covered from the storm. They were, indeed, delivered into the hands of Cromwell. Three thousand were slain, and nine hundred taken prisoners. The Scottish parliament, taught by this disaster the necessity of an union of all parties, resolved, in their meeting at Perth, to call in the aid of the Malignants and Engagers, on condition of a repentance of errors, which was ridiculously dictated and adopted. But two shires in the west of Scotland protested against this admission of the ungodly to co-operate in the cause, and withdrew from the general levy five thousand men.

Tired of the gloomy restriction in which he was held by the Scottish clergy, Charles endeavoured to make his escape to a body of royalists in the Highlands; but he was overtaken, and persuaded to return. This incident, which was denominated the *start*, procured him better treatment, from the fear of losing him. His coronation was performed at Scone with great solemnity. The crown was placed on his head by the marquis of Argyle, whose own head was afterwards the forfeit.

Charles encamped at Torwood, and his generals resolved to pursue the same cautious conduct which had been observed by Lesly, and fatally over-ruled by the clergy. The town of Stirling was behind; the north supplied them with provisions; and entrenchments protected their front; but their position was by no means so favourable as in the former year at Edinburgh; and Cromwell, unable to force them in front, yet, by defeating a detachment on their flank, got between them and the north, and Charles adopted a resolution sufficiently desperate, which Argyle vainly endeavoured to oppose;

* The Malignants were those suspected of Popery or royal principles. The Engagers were that party who had made the treaty or engagement with Charles I. in Carisbrook Castle.

he marched to the south, to carry the war into England, relying on the English royalists for support; but neither these nor the Presbyterians, though they hated Cromwell, would join an army of fugitive invaders. The militia opposed him in front, and Cromwell hung upon his rear. At last, the Scottish army, who had thrown themselves into Worcester, were attacked by Cromwell with 30,000 men, and, after a desperate contest, were all either killed or taken prisoners. The king, escaping with difficulty (see the article CHARLES II.) from the field of battle, after a multitude of adventures, at last reached Shoreham in Sussex, where a vessel transported him to France. The executions of the royalists, after this suppressed insurrection, were directed, in consequence of sentences by court-martial; for Cromwell had already found, that a trial by jury would not support tyrannical usurpation. By the strength of the usurping government, a total pacification was produced at home. Ireton proceeded with 30,000 men successfully in the work of subduing Ireland, till his death.

Ludlow, his successor in the command, continued to push the advantages, and to gain an easy victory. Monk, who had been left with 7000 men to overawe Scotland, reduced the whole kingdom to subjection, and an union with England was pressed upon the Scotch at the point of the sword. Of ninety Scottish towns and counties to which writs were issued to send representatives to the English parliament, only thirty complied. Argyle alone acted with public spirit amidst the calamities of his country. He retreated to his estate, where he fortified himself for some time; and though he acceded, at last, to an union with England, he was the last man in Scotland who yielded to Monk. Sir George Ayscue was sent to reduce the colonies; all of which, except New England, had declared for the king; and Bermudas, Antigua, Virginia, and Barbadoes, were soon reduced. With equal ease were Guernsey, Jersey, Scilly, and the Isle of Man, subjected; and the sea, which had been infested by the privateers of those islands, was rendered safe to English commerce. The countess of Derby, who defended the Isle of Man, had the glory of being the last person in the British dominions who submitted to the victorious commonwealth.

The new government next exerted its energies abroad. The Dutch had shewn symptoms, during the late civil wars in England, of attachment to the royal cause. It was long before the parliamentary envoy could obtain an audience of the states-general. Dorislaus, a Dutchman by birth, but who had resided in England, and taken an active share in the king's death, had been assassinated by some English royalists in Holland, who had not been pursued by the Dutch government with such rigour as was expected. The prospect of rich prizes from the Dutch, and of diverting men's minds from tyranny at home by splendid achievements, determined Cromwell and his parliament to change their proposed alliance with their fellow-Protestants into a furious war.

The Dutch, though they dreaded and deprecated a war, prepared a fleet of 42 sail to protect their navigation, which their famous admiral, Tromp, commanded. Blake, the English admiral, met him in the straits of Dover, and a battle was fought, in which it is not known which party commenced hostilities, with no decisive victory on either side. The Dutch fleet, however, retired to their own coast, and their government still negotiated for peace. The English demanded immediate

reparation for all the damages they had sustained; on the refusal of which, they declared war.

Sir George Ayscue and the gallant De Ruyter fought another and still severer battle off Plymouth, in which the Dutch had the superiority of bringing off their convoy, and leaving the English so shattered, that they could not pursue them. Blake was more successful in an action off the Kentish coast with the squadron of De Ruyter and De Wit, in which he took three of their ships, blew up one, and obliged the enemy next day to sail for their own harbour. Tromp, seconded by De Ruyter, met near the Goodwins Sands with Blake, whose fleet was inferior to the Dutch, but who resolved not to decline the combat. The Dutch had the advantage, and night came opportunely to save the English fleet, after two of their ships were taken, two burnt, and one sunk. But preparations were instantly made to wipe off this disgrace; and, in a battle which was fought early in the spring of the succeeding year between Blake and Tromp, with De Ruyter under his command, the Dutch lost eleven ships, whilst only one of the English was sunk.

The Dutch were so far humbled by these and other disasters, as to sue for peace. The parliament, however, gave them a very unfavourable answer. They studied to keep their navy on foot as long as possible, judging that, while the force of the nation was exerted by sea, it would diminish the power of Cromwell by land. Cromwell perceived their designs; but, being secure in the attachment of the army, resolved to seize the sovereign power. By his instigation, the officers presented a petition, demanding their arrears, and redress of grievances, desiring the parliament to consider how many years they had sat, and what promises they had made to establish a free constitution. The house was highly offended; they appointed a committee to prepare an act, pronouncing such petitions high treason. The officers made a warm remonstrance, and the parliament an angry reply. Cromwell, on being informed of this reply, started up in the council with an appearance of fury, and, turning to major Vernon, cried out, that he was compelled to do a thing that made the very hairs of his head stand on end. Then hastening to the house with 300 soldiers, and with the marks of violent indignation on his countenance, he entered, took his place, and attended to the debates for some time. When the question was ready to be put, he suddenly started up, and began to load the parliament with reproaches for their robbery and oppression of the public. Then stamping with his foot, he gave the signal for the soldiers to enter; and, addressing himself to the members, "For shame! (said he), get you gone: give place to honest men. I tell you, you are no longer a parliament; the Lord has done with you." Sir Harry Vane exclaiming against his conduct, "Sir Harry Vane!" (cried Cromwell with a loud voice), "O sir Harry Vane! the Lord deliver me from sir Harry Vane!" Taking hold of one of the members by his cloak, "thou art a whoremaster," cried he; to another, "thou art an adulterer;" to a third, "thou art a drunkard and a glutton;" and "thou an extortioner," to a fourth. "It is you," continued he, to the members, "who have forced me to this." Then, pointing to the mace, he exclaimed, "take away that bauble!" after which, turning out all the members, he ordered the doors to be locked, and returned to Whitehall with the keys in his pocket.

Though Cromwell had, by this transaction, seized in

effect upon unlimited regal power, he was willing to give his subjects a parliament. It was such a parliament, however, as should be entirely at his devotion, and one of his own nomination. By the advice of his creatures, his council of officers, he sent summonses to 144 persons in England, Scotland, and Ireland, to assemble as the representatives of the nation. This parliament, composed of the dregs of fanaticism and ignorance, was denominated Barebones parliament, from the name of one of its members, a leather seller, whose assumed name, by a ridiculous usage of the age, was Praise God Barebones. They began by choosing eight of their number to seek the Lord in prayer, while the rest deliberated on substituting the law of Moses, instead of the established code.

The usurper did not find even this miserable assembly entirely flexible to his will, and as the nation despised them, Cromwell had no motive for retaining them. He had carefully chosen many among them, who were entirely devoted to his interests, and these he commanded to dismiss the assembly. They accordingly met by consent earlier than the rest, and observing to each other that this parliament had sat long enough, they hastened to Cromwell, with Rouse their speaker at their head, and resigned their authority into the hands which had conferred it. Cromwell accepted their resignation with pleasure; but being told that some of their number were refractory, he sent colonel White to clear the house of such as ventured to remain. They had placed one Moyer in the chair by the time that the colonel arrived, and he being asked, by White, what they did there? replied, "seeking the Lord." "Then you may go elsewhere," cried White, "for, to my knowledge, the Lord has not been here these many years." Cromwell was now declared the protector of the commonwealth of England, and instituted in his new office in the palace of the kings of England. He was addressed by the title of Highness: A council was appointed, which were not to exceed 21, nor to be under 13 persons. They were to enjoy their offices for life, or during good behaviour; and, in case of a vacancy, the remaining members named three, of whom the protector chose one. The protector was appointed supreme magistrate of the commonwealth; from him were all magistracy and honours derived; he could pardon all crimes but murder or treason, and all forfeitures devolved to him. The right of peace, war, and alliance, rested in him; but in making these, he was to act by the advice of his council. The power of the sword was vested in him jointly with the parliament; and he was obliged to let a parliament sit, at least for five months, every three years. The bills of parliament were to pass as law, even if the protector did not give his assent to them after 20 days. A standing army of 20,000 foot and 10,000 horse were to be maintained, and in preventing their diminution alone, the protector was to have a negative. During the intervals of parliament, himself and his council were to exercise a power of passing laws. To this contradictory constitution it is evident that Cromwell never needed to pay deference, as long as the army remained at his disposal.

As he was feared at home, so he made himself respected abroad. The Dutch, after many severe conflicts, were completely humbled at sea, in a battle fought the 29th of July, between Blake and Tromp, in which the latter fell, and the enemy lost 30 ships. They sued for peace, and obtained it, on consenting to pay deference to the British flag, to abandon the interests of young

Charles, and to pay a fine to the English East India Company.

Either from want of pecuniary resources, or from a wish for popularity, Cromwell resolved to give the nation a parliament of a much more respectable nature than the last. But this parliament, from the circumstance of its being fairly elected, so as to represent the feelings of the nation, became only the organ of its discontents. And so severe was their investigation of his conduct, and so free their censures, that, after having extorted from them, by force, a recognition of his authority, he was obliged to dismiss them before they had sat the time ordained by the new constitution. The royalists, in their joy at the odium which this arbitrary measure occasioned, forgot that there was either a terror of the protector's arms in the country, or men less attached to royalty than themselves, they projected a conspiracy, which the dexterity of the protector crushed in the bud. Only 200 of them convened at Salisbury, who were speedily suppressed by a troop of horse. The affair was a sufficient pretext to Cromwell for raising a heavy tax, by way of punishment, on the whole party of suspected royalists, or rather on all individuals whom this rapacious officer chose to pronounce disaffected. Ten major generals were appointed to raise this tax, and the kingdom was divided into so many military jurisdictions. The iniquitous tax was levied, without proof or trial of delinquency, at the mercy of those minions of his usurpation.

Cromwell's ambition was not satisfied with the barren and disputed glories of the Dutch war; but he was impelled, by the hopes of plunder and of additional renown, to signalize his arms against Spain. After he had equipped two squadrons on the unknown destination, of which the attention and fears of all Europe were fixed, one of them, consisting of 30 capital ships, sailed to the Mediterranean, and overawed the powers of Italy. Then returning westward, restrained the piracies of the African States. Blake, who commanded this armament, having received a defiance from the Dey of Tunis, who shewed him his three castles and bade him do his utmost, drew up his ships close to the fortress, and tore them in pieces with his artillery; after which he burned every ship that lay in the Tunisian harbour. The other squadron under Venables and Penn, was not so splendidly successful. Those commanders having made an attempt on Hispaniola with 9000 men, were repulsed with loss by the Spaniards; but afterwards, steering to Jamaica, they took that island without a blow. Yet so little was this valuable conquest esteemed, that, on their return home, the commanders were committed to the Tower for their failure of the primary object of the expedition.

The Spaniards having declared war in consequence of this unwarrantable violation of the treaty, admiral Blake lay for some time off Cadiz, in expectation of intercepting the Plate fleet; but was at last obliged, for want of water, to sail towards Portugal. Hearing that the Spanish fleet of 16 ships of immense value had taken shelter in the Canaries, he pursued them thither, and sailing into the port of Santa Cruz, burnt them in the face of seven castles which defended the harbour. A sudden change of the wind brought him safe back from before the batteries. Leaving Europe astonished at this act of fortunate temerity, Blake returned home, and died within sight of his native shore, (see *BLAKE*.) The whole of Europe was either overawed by the arms of the protector, or willingly courted his alliance. He

obliged the duke of Savoy to abstain from the persecution of the Protestants, and dictated the same toleration to France. Yet when Catholic powers interceded for the Catholics in Britain, he gave them an imperious refusal.

Amidst external successes, the protector's domestic administration was in general upright. He erected, it is true, high courts of justice, for the trial of offensive persons, whom he knew that an English jury would not be servile enough to condemn. He set aside the verdicts of juries; and in the case of Lilburne and others, inflicted unlawful punishments; but his treatment of those enemies of his government, is not to be compared, in the most distant degree, with the enormities of the star-chamber; and except in some political instances, the administration of justice was unexceptionable. He maintained a national church, which was neither Episcopal nor Presbyterian. A number of commissioners called triers, laymen, ecclesiastics, presbyterians, and independents, examined those who received holy orders, presented to all livings, and inspected the lives, doctrine, and behaviour of the clergy. The candidates were not puzzled with questions in Greek and Roman erudition, but their advances in grace were severely scrutinised. The independents were chiefly favoured by him, and such of that sect as could digest his usurpation were mutually attached to him; but he tolerated all sects except prelatists and papists. As he found many enemies among the military, though the army in the main supported his power, he established a militia over the counties, to form a check to that formidable body.

Scotland was governed by a council of state, of which lord Broghill was president, appointed to reside in Scotland, subordinate to the protector and his English council, and strictly responsible to the former. Of nine members, only two were Scotsmen. Its powers, which were more extensive than those of the privy council, comprehended the civil administration, the disposal of the revenue, and the nomination of inferior judges. The people, however, had no share or interest in the government. To Barebones parliament only five Scotch members were summoned; and though by the instrument of government, which first declared Cromwell protector, 20 Scotch representatives were appointed, yet in succeeding parliaments the representatives were either English officers or temporizing Scotsmen, in whom the protector could confide.

Cromwell's military establishment in Scotland amounted, during the insurrection of Middleton, to 18,000 men, but was reduced to 9,000, exclusive of some considerable garrisons. Twenty-eight garrisons were maintained in the forts and castles, but the principal forces were stationed at Leith, Ayr, Inverness, and Glasgow, where citadels were erected, and at Inverlochy castle, which overawed the Highlands. An annual land-tax of 120,000*l.* sterling was first imposed, but found intolerable, and reduced to 72,000*l.* In 1656, the Scottish customs amounted to 4,637*l.*, and the excise to 34,313*l.*; but they increased in three years, by diligent collection, to 62,000*l.* sterling. The public revenue at Cromwell's death was 143,642*l.*; the expenditure, civil and military, 286,458*l.* The annual balance, 142,806*l.*, was remitted from England—so far was Scotland from being a lucrative conquest. The decisions of Cromwell's judges in Scotland, of whom four out of seven were English, were long remembered as the purest and most vigorous dispensations of justice which the nation had enjoyed.

The administration of Ireland, which was entrusted to the fanatic Fleetwood, was more violent and severe. About five millions of acres, forfeited by the popish rebels or by the adherents of the king, were divided among Cromwell's soldiers, and partly among the adventurers, who had lent money to the parliament. Examples of a more sudden or violent change of property, are scarcely to be found in any history.

After establishing a government so much feared both at home and abroad, Cromwell thought he might now venture to meet the representatives of the people, and summoned another parliament. But though he tried every art which his new model of representation allowed him, to have his creatures elected, it was only by setting guards at the door of the house, and permitting none to enter who did not recognise his authority, that a servile majority could be procured. From these, indeed, on the motion of alderman Pack, after the suggestion of Jephson, he received an offer of the crown, which it is well known he wished to have been pressed upon his scruples and timidity. But, independent of the vengeance of the army, and of Lambert, Harrison, and other general officers, whose dismission he meditated, he feared the enmity and alienation of many who were most devoted to him, if he should betray his ambition by this acceptance. Fleetwood, who had married his daughter, and Desbrowe, who had married his sister, threatened to abandon him if he assumed the crown. A mutiny in the army might be looked to as the consequence; and assassination, it is said, was determinedly prepared for him. After a long and doubtful agony, Cromwell refused the crown, though solemnly tendered to him.

The protectorship had been first sanctioned by what was called an instrument of government. The present parliament new-modelled the constitution, by framing an humble petition and advice. By this deed, the powers of the protector were in some instances enlarged, in others diminished. He had the power of nominating his successor; he had a perpetual revenue assigned to him; a million a year for the pay of the fleet and army; 300,000*l.* for the civil government; and he had authority to name another house, who should enjoy their seats during life, and exercise some functions of the former House of Peers. But he abandoned the power of framing laws with his council in the intervals of parliament. He was inaugurated anew, in Westminster Hall, in the most solemn manner.

The state of domestic affairs did not take off his attention from those abroad. He supported an alliance which he had formed with Sweden, and joining with France against Spain, he sent 6000 men, under general Reynolds, to the continent, who did honour to the military character of England. After the decisive victory of Dunes, Dunkirk was delivered to Cromwell, who put an English garrison into it.

The system of his foreign politics was bold but unwise; had he lived longer, he would probably have been the accessory means of accomplishing, a century sooner than it has happened, that conquest of the low countries by France, which has been since followed by the subjugation of Europe. Amidst this success and splendour, he was conscious of being secretly detested, and his situation became every day more alarming. A conspiracy of the royalists, which Ormond came over to foment, was indeed detected, and Ormond was obliged to fly; but the spirit of discontent was not eradicated by the punishment of those who were convicted. Harrison,

Lambert, and the other discarded officers of the army, and the whole sect of the Millenarians, were cherishing plans for his destruction; and Sindercome, who had undertaken to assassinate him, was with difficulty condemned by a jury. He had not even domestic consolation; for his own family had so vehemently imbraced republican principles, that they could not, without indignation, behold him invested with despotism; and Mrs Claypole, his favourite daughter, upbraided him on her death-bed with all the crimes of his ambition. A pamphlet, of uncommon eloquence, entitled, "*Killing no Murder*," was written by colonel Titus, to prove, that his assassination would be meritorious. The usurper read this spirited production, and it is said was never seen to smile afterwards. He was haunted with perpetual fears of assassination; he wore armour under his clothes, and always kept pistols in his pocket. His aspect was clouded by a settled gloom, and he regarded every stranger with suspicion. He travelled with a numerous guard, and with the hurry of alarm; never returned from any place by the road he went, nor slept above three nights successively in the same chamber. At last he was delivered from this life of horror by a tertian ague, of which he died, September 3d, 1658, after having usurped the government nine years. A deputation from the council asked him, in his last moments, to name his successor, but his senses were gone, and a simple affirmation was, or seemed to be extorted from him, when they mentioned his son Richard. (For his character, see CROMWELL.)

The council recognized the succession of Richard. Fleetwood, in whose favour it was supposed that Cromwell had formerly made a will, renounced all pretension to the protectorship. Henry, Richard's brother, who governed Ireland with popularity, ensured him the obedience of that kingdom. Monk, who was powerful in Scotland, immediately proclaimed him Protector; the army and the fleet acknowledged his title; the counties and corporations addressed him in terms of allegiance; and foreign ministers crowded to pay him compliments. Richard accepted an empire, which was so fairly tendered to him. A parliament being assembled, the commons signed an engagement not to alter the present government; but, in all their proceedings, there was so much opposition, as to alarm the partizans of the new protector. Dangers were arising also from other quarters. Fleetwood, and other republican leaders of the army, aided even by Desbrowe, the father-in-law of Richard, and Lambert, a dismissed officer of great influence, were forming cabals, and united into a faction, which, from the place of Fleetwood's abode, where it met, was called the party of Wallingford-house. The city militia were brought over to their designs. The parliament was no less alarmed at the military cabals than Richard, and passed a resolution against their meetings; but the officers hastened to Richard, and demanded of him the dissolution of parliament. Richard complied; and being thus effectually deposed, soon after signed his resignation.

The officers being thus left with authority supreme for the present, however unstable, recalled the Rump parliament, which had been expelled by Cromwell, whose numbers little exceeded 70 members. The first use which this assembly made of its power, was to change and cashier some of the military leaders, who had appointed them. The officers immediately resolved to dissolve them. General Lambert drew up some chosen

troops in the streets leading to Westminster Hall, and ordering the horses to be taken from the carriage of the Speaker, Lenthall, civilly conducted him home. A military government was now established, over which the officers appointed a committee of 23 to preside. Previous to this dissolution, the army under Lambert had suppressed, in concert with parliament, an insurrection of the royalists at Chester, where Booth, their leader, was routed and taken prisoner, with numbers of his undisciplined followers. The parliament, also, while it preserved its authority, mediated by force, and in unison with the Dutch republic, between the conquering king of Sweden and his enemies. Admiral Montague sailed to the Baltic, and Algernon Sidney, as ambassador, commanded the Swedish monarch to desist from the siege of Copenhagen, who exclaimed, with a vain indignation, at the interference of paricides and pedlars; so he chose to designate the British and Dutch.

Monk, who was in Scotland with 8000 veteran soldiers, no sooner heard of the forcible dissolution of parliament, than he protested against it; and summoning a convention of estates in Scotland, received a seasonable though small supply of money, which enabled him to march into England. Naturally reserved in his temper, and probably undecided himself what course he should pursue, he concealed those intentions which he cherished, beyond the mere support of parliament, with so much address, that when his own brother came to Scotland, to sound his intentions, he would not entrust him with his confidence. Fleetwood, who was nominally at the head of the army in England, was a weak superstitious man. Lambert, without the highest abilities, but active and ambitious, was really the first, with the name of the second in command; but as the troops were every where revolting to parliament, he was unable to oppose the progress of Monk, and only treated with him as that wary general advanced to the south. The military government, in despair, summoned again that parliament which they had dismissed in contempt; and the parliament, as before, acting in hostility to the military government, cashiered its officers. Unable, however, to overawe or resist Monk, they sent deputies to be spies upon him, under pretence of congratulations. Monk, in the mean time, proceeded with his army to London; the gentry, on his march, flocking round him with addresses, and expressing their desire of a new parliament: but the general still preserved his inflexible taciturnity, and arrived within a few miles of St Albans, without dispelling the suspense of the public mind respecting his designs. From St Albans he sent a message to the parliament, desiring them to remove such forces as remained in London to country quarters. Some of the regiments willingly obeyed this order, and such as did not, Monk turned out by force; after which, he took up his quarters, with his army, in Westminster. The house voted him thanks for his services: he desired them to call a free parliament, and this soon inspired the citizens to refuse submission to the parliamentary government. They resolved to pay no taxes, till the members who had been excluded by colonel Pride should be replaced: for they were permitted to do this by Monk at the desire of parliament. He arrested eleven of the ruling common-councilmen, broke the gates and portcullises of the city, and returned in triumph to his quarters at Westminster. The next day, however, he made an apology for his conduct, and

promised for the future to co-operate with the lord mayor and common council, in such schemes as they should approve.

The commons used every effort in vain to detach Monk from his new alliance with the citizens; some of them even promised to support his usurpation of supreme power; but his resolution was to make them restore the secluded members. These, when they took their seats, proved the majority, and the rump party thought proper in their turn to withdraw. The victorious restored party, after enlarging and confirming Monk's commission, and voting support for the fleet and army, dissolved themselves, and gave orders for a new election. Monk, in the mean time, expelled from the army all the officers who would not engage to obey implicitly the orders of the ensuing parliament; and dispatching Colonel Ingoldsby against Lambert, who had escaped from the Tower, and was drawing together the malcontents, made that general surrender prisoner, and dispersed his few followers. Though the calling a free parliament, and restoring royalty, were regarded, from the known temper of the nation, to be the same measure, yet Monk had not hitherto declared his specific purpose. Morrice, a gentleman of Devonshire, a man of studious and sedentary habits, was his only confidant. Sir John Granville, who had a commission from the king, having applied to Morrice for access to Monk, and having twice refused to deliver his message to any but the general himself, was at last entrusted with a verbal answer to the king, revealing the general's design of the restoration, and giving advices for his journey to England. By this advice Charles escaped rapidly to Breda: had he protracted his journey a few hours, it was thought the Spaniards would have detained him as a pledge for the restoration of Jamaica.

The elections for the new parliament went every where in favour of the king's party. The Presbyterians had the kingdom almost entirely in their hands; some of their leading men, it is true, began to speak of severe restrictions, but the general opinion was, for admitting the monarch on easy terms. When Parliament met, however, the caution of Monk, and the fear of undetermined events, kept the members in such awe, that for several days no one dared to make mention of the king's name. At last, Monk directed Annesly, president of the council, to inform them, that one Sir John Granville, a servant of the king's, was at the door with a letter from his majesty. The loudest acclamation followed,—Granville was called in. The letter, accompanied with a declaration, was greedily read. Without delay or dispute, a committee was appointed to answer it. It was voted, that the letter and declaration should be immediately published.

From Breda Charles proceeded to Scheveling, where Admiral Montague coming in sight with his fleet, without waiting for orders from parliament, tendered his loyalty to the king. When he disembarked at Dover, he was received by Monk, whom he cordially embraced; and he entered London amidst the loudest acclamations on the 29th of May, which was the birth-day of his 30th year.

The temper and manners of Charles were easy and familiar; and his character, which experience discovered to be perfectly worthless, was at first appearance popular and respected. To this delusion, the reflux of public opinion from republicanism to loyalty, certainly contributed. The parliament was devoted to

him, although composed of many members who had torn the crown from the head of his father. Yet these once popular leaders might now be strictly styled loyalists, since they implored pardon in the name of the nation for the guilt of the late rebellion. Several of those apostate republicans were brought into office; three of the most noted were Hollis, Annesly, and Cooper, afterwards Lord Shaftesbury. To conciliate the most numerous body of the dissenters, the king chose two Presbyterian ministers for his chaplains. The forts were dismantled, and the army reduced to a few thousands. Men of abilities filled the important offices of state. The treasurer's staff was given to the virtuous Southampton; Sir Edward Nicholas was made secretary of state; and Lord Clarendon, a wise and able, though in religious matters a narrow-minded statesman, was his chancellor and prime minister.

Much praise has been given to Charles for promoting the bill of indemnity, which was passed by this first parliament, respecting those concerned in the late regicide; a bill from which so few were excepted, and of those few a still smaller number were consigned to punishment. But the truth is, that the most of the exceptions from this indemnity were illegal and disgraceful. The king published a proclamation, ordering the late king's judges to surrender within nineteen days, otherwise they should receive no pardon. Scrope, who surrendered on the faith of this proclamation, which certainly implied a promise of mercy, was put to death. The execution of the military officers who attended the execution of Charles I. was an act equally abhorrent to law and justice. The estates of Cromwell, Ireton, and other dead regicides, were confiscated, and their bodies, by a weak and indecent act of revenge, were hung upon a gallows. This vindictive spirit extended even to the memory of the gallant Blake, whose remains were insulted. After the bill of indemnity, the next business that came before parliament, was the settlement of the king's revenue, which was fixed at 1,200,000*l.*; a sum greater than any English monarch had before enjoyed. There was not, indeed, time to settle the funds from which this revenue was to be raised; for the parliament was dissolved in December 1660, after having sat for seven months since the Restoration.

The ministry of Clarendon exhibits by far the least exceptionable part of Charles's reign, yet the religious views of that minister were narrow and uncharitable; and while the king, in a public declaration, promised entire toleration, and even some share in ecclesiastical benefices, to the Presbyterians, it was far from the intentions of the ministry to preserve such regard for them. The madness of the Millenarians afforded them a pretext for confounding all the enthusiastic and dangerous sectaries with the Presbyterians, who were truly loyal. One Venner, an insane enthusiast, at the head of 60 armed followers like himself, who believed themselves invincible and invulnerable, proclaimed Jesus King, and terrifying all London, committed an unprovoked murder. They retreated to Caen Wood on being attacked by the train bands, but returned and traversed the city once more. At last, they were overpowered in a house to which they retired, and those who were left alive were brought to execution. The pretext was greedily embraced by the high church party, to confound the Presbyterians with sectaries the most obnoxious in politics.

Affairs in Scotland hastened with a still quicker pace

to the establishment not only of monarchy, but of despotism in church and state. The compliant Scottish parliament, annulled all laws which had passed since 1633; they declared the covenant unlawful, and voted a revenue to the king of 40,000*l.* a year. The lords of articles were restored; and it was determined, at the instance of Middleton the Scottish minister, and with the advice of Clarendon, to restore prelacy in that kingdom,—a measure pregnant with calamity.

As Scotland had not been included in the restored monarch's promise of amnesty, it was deemed expedient to make examples of severity in that kingdom. Argyll suffered death after an iniquitous trial: the man who had been the last to submit to Cromwell in Scotland, and who, when Charles was proclaimed in Scotland, had placed the crown on his head. Johnstone of Warriston suffered two years after.

A new English parliament met on the 8th of May 1661, in which only 56 members of the Presbyterian party had obtained seats; so successful had been the efforts of the court to secure a majority of the zealous royalists and high-churchmen. The acts of this parliament were such as might have been expected from their principles. All coercive power, even in both houses united, over the person of the king, was renounced. With the command of the militia, the power of the sword was restored to the crown. This was a lawful concession to the supreme magistrate; but the liberty of the subject was submitted to be trampled under foot, by the act which empowered Charles to purge corporations of magistrates whose principles he suspected. The test to which their loyalty was submitted, was declaring the unlawfulness of any resistance to the king. The doctrine of non-resistance was also introduced into the tenets of the church, and enjoined on all its members. The church of England was re-established as it stood before the civil wars; and, as the old persecuting laws of Elizabeth were revived, the king's promise of indulgence to tender consciences was completely broken. Charles was in his heart a papist, as far as he possessed religion. This was suspected, but not yet known; but, as he professed himself zealously attached to the English church, it was voted a crime by this obsequious parliament to deny the episcopal faith of his majesty.

When the act of conformity passed in 1662, the parliament, in the height of its loyalty, ventured to check the wishes of the sovereign; but this deviation from their general slavish spirit was for no charitable object. Charles, for the sake of the Catholics, was desirous to exercise his dispensing power; but the parliament urged him to recal his declaration of indulgence, and let him know, that the dispensing power which he claimed was not a part of his prerogative. The intoxication of loyalty, however, began to wear off from a multitude of causes. The act of uniformity, by which 2000 of the Presbyterian clergy were ejected from their livings, may sufficiently account for the alienation of that body of dissenters. Other acts of the same kind, as they struck at all dissenters whatever, enraged and united them against government, already perjured in its promise of toleration. Of the zealous churchmen, some already suspected the popish principles of Charles: The royalists, who had served him, saw him squandering, on infamous pleasures, the money that might have rewarded their losses in his service; and complained, that the act of oblivion was extended only to his friends.

After the army had been dismissed, perpetual and groundless jealousies had been kept alive of the disbanded officers. On the trifling insurrection of Venner, they were insultingly ordered to remove from London. From being continually suspected, the sectaries came at last to deserve suspicion. Clarendon, himself an alarmist, spread incessant rumours of plots and insurrections, and kept alive the memory of divisions, which ought to have been consigned to oblivion. Some of the first fruits of the restoration were, therefore, to fill the gaols with innocent state prisoners, and the court and country with spies.

During the protector's war with Spain, he had supported the Portuguese in their revolt from that power; and on the restoration, advances were made by Portugal for the renewal of the alliance, together with an offer of the princess of that kingdom in marriage, which was embraced by Charles.

The king's marriage with the daughter of Portugal, while it brought him 500,000*l.* with two fortresses for her dowry, (Tangier in Africa, and Bombay in the East Indies,) was unpopular from the religion of the princess; and, like the sale of Dunkirk, which he made over to the French in the course of the same year for 400,000*l.* it discovered his necessities, and the prodigal disposition which had occasioned them. Even his loyal parliament perceiving they had now to deal with a monarch, profuse, without gratitude, justice, or generosity, and what was still more unpardonable in their eyes, inclined to tolerate papists, became cautious and sparing in their supplies.

To deprive the Catholics of all hopes, the two houses concurred in a remonstrance against them. The king gave a gracious answer, but to divert the attention of the commons to a subject more profitable to his own interests, he laid the state of his revenue before them, and again implored their assistance. They granted him four subsidies; and the clergy in convocation followed the example of the commons.

An important change was now preparing, which forms an unhappy era in the reign of Charles, viz. the dismissal of Clarendon. Clarendon's objections to the Portuguese match, and his refusal to coincide with a plan, which an overloyal member of parliament had pledged himself to accomplish, of making the king independent of parliament by a fixed revenue of two millions a year, have been assigned as the cause of Charles's alienation from that minister. A still more obvious cause may be traced in Clarendon's zeal against popery. Charles, who was too indolent himself to attend to business, gladly allowed his brother, the Duke of York, to take an active and leading management in public affairs. James, who thus possessed the first influence at court, was a bigotted papist; and his faith was sufficient to make him the enemy of Clarendon. The chancellor was also obnoxious to the mistresses of Charles; for he had disdained to pay his court to them. An impeachment against him, conducted by the personal hatred of Lord Bristol, terminated, however, in the disgrace of the accuser, and the minister lingered a while in power after his fall had been decreed.

The first Dutch war under Charles commenced during the administration of Clarendon and Southampton; but it is easy to believe what is said of those ministers, that they were averse to it. It was, however, a war of the people's, or at least of the parliament's wishes, as much as the king's; for we find the commons, during

that memorable session, in which they repeated the triennial act, breathing indignation at the Dutch, and promising aid to the king if he should go to war with them. Charles, and still more the Duke of York, who ruled him, hated the Dutch for their manners, religion, and free government. James had a turbulent activity, which required employment; and Charles not only longed to rival the naval glories of Cromwell, but to have that command of money, which the supplies for a war could afford. On the pretence of two merchant ships captured by the Dutch, for which the English owners were about to accept a compensation, and of some other causes still less important, war was commenced. The Dutch were expelled, even before a declaration of war, from their territories in Africa, and New York was seized by the English. De Ruyter recovered to his country her possessions on the coast of Guinea, but failed in his attempt on Long Island and Barbadoes. A battle between the grand fleets of the two nations, the Duke of York commanding the English, and Opdam the Dutch, was fought on the 6th of June 1665, in which the latter, who were vanquished, lost nineteen ships. This victory excited so much jealousy of the English, that France and Denmark resolved to protect the republic. The rumour of a French fleet, under Beaufort, approaching from Toulon to join De Ruyter, occasioned the Earl of Albemarle, (lately Monk) who now commanded the English, to weaken them, by detaching Prince Rupert with a fleet to watch that of the French. The remainder of the English set sail to give battle to the Dutch. In a combat, which lasted, with some intermissions, for four days, the English were worsted, and pursued upon the second day; and on the third were only saved by the arrival of Prince Rupert with sixteen fresh ships; on the fourth the combatants were parted by a mist. A second and equally bloody engagement took place soon after, in which the Dutch were vanquished; but they were soon in a condition to face their enemies, by the junction of Beaufort, the French admiral. The Dutch fleet appeared in the Thames, conducted by their illustrious De Ruyter. The English were thrown into the utmost consternation; a chain had been drawn along the river Medway, and some fortifications had been added to the forts along the bank. But these were unequal to the invading force: the Dutch broke the chain, and, destroying the shipping in their passage, advanced to Upnore Castle, and returned, after terrifying and insulting the coast, being only prevented, by the French failing to join them, from laying London itself in ashes. During these transactions, a plague had broken out in the metropolis, which carried off about 90,000 of the inhabitants; and a fire, which it is to be hoped, from the disuse of wooden buildings and narrow streets, will long be called the last great fire in London, consumed the greater part of the city. By a stretch of the regal power, which was entirely illegal, the city was ordered to be rebuilt on a new and more commodious plan; but when it is considered, that London, in consequence of that arbitrary order, rose, like a phoenix, more beautiful from her ashes, and that the plague, which before had been seldom, if ever, totally banished from her unwholesome and narrow alleys, was extirpated by this accident, we can scarcely lament the passing misfortune, still less blame the exertion of prerogative for a purpose so beneficent. The fire of London was, from the violence and credulity of popular prejudice, ascribed to the Papists; and Charles was obliged, by the parliament them-

selves countenancing this falsehood, to issue a proclamation against the priests and Jesuits, which, like all other proclamations of the kind, were meant more to pacify the fears of Protestants, than to operate against the professors of the Romish faith. The ill humour which the parliament displayed at the bad execution of this edict, was felt by Charles in diminishing his resources for the war; and a treaty for peace had been begun with the States, before the last-mentioned triumph of the Dutch arms. By the signing of the treaty of Breda, (10th July 1667,) the English were left with no other acquisition than New York, while the pretended objects of the quarrel were, in fact, ceded to the combined enemy. The public mind, however, soured by disasters, and inflamed by the late disgrace, seemed to require some important sacrifice; and as Clarendon, the prime minister, was unpopular with the country, obnoxious to parliament, and disagreeable from his very virtues to Charles, there was a combination for his ruin among all parties. When he was impeached by parliament, Charles basely gave him up: he retired into France, where he lived in a private manner till his death.

To this war with Holland, a triple alliance between the three great Protestant powers, England, Holland, and Sweden, soon succeeded; but it was founded on principles of too much utility to be sincerely cherished by Charles. By this league, which was signed by the wise and exalted Sir W. Temple on the part of England, by Van Beuninghen for Holland, and by D'Ohna for Sweden, the Netherlands were protected from France; and by the treaty of Aix la Chapelle, (which the triple alliance produced,) all Europe seemed to be promised repose under that Protestant confederacy; yet, amidst the rejoicings for the event, Sir Thomas Clifford, who possessed more of Charles's confidence than any of his ministers, betrayed, by an unguarded expression, the secret perfidy of his master. Notwithstanding all this joy, said he, we must still have another Dutch war.

In turning our attention, at this period, to the sister kingdom, we find the yoke of prelacy, which the restoration had imposed on Scotland, attended with the most atrocious oppression. Middleton, whose drunkenness and cruelties had made his administration of Scottish affairs contemptible as well as odious, was disgraced in 1663, and was succeeded by Lauderdale, who, with a dark and vindictive temper, had yet the merit of intending more lenity to his Presbyterian countrymen, than the fury of the prelates, on whom he was dependent, would permit him to exercise. A court of ecclesiastical commission traversed the kingdom, bound by no forms of law, and confined to no place nor time of meeting, but established on the strictest principles of the Spanish inquisition. The civil and military affairs were subordinate to them; their sentences were pronounced without accusation, evidence, or defence. The soldiery were let loose upon the people; all who attended, or were suspected of attending, the Presbyterian form of worship, were fined, imprisoned, or transported to the plantations. When sufferings too great for human patience, had at length driven the Scottish Presbyterians to insurrection, their defeat at Pentland afforded a pretext for judicial bloodshed, as well as fine and proscription. But the victims died with such exultation, that it was at last difficult to procure executioners. M'Cail, a young preacher, whom the prelates had excruciated, to

extort a confession of his associates, endured the torture of the iron boot till his leg was crushed and broken, and expired in extacy on the scaffold, exclaiming, with a sublime enthusiasm, "Farewell, thou sun, and moon, and stars! farewell, world and time! farewell, weak and frail body! Welcome eternity! welcome angels and saints! welcome Saviour of the world! and welcome God, the Judge of all!"

Towards the conclusion of an unfortunate and disgraceful war, the king was compelled to mitigate every where the rigours of government; and when he had sacrificed Clarendon, the prelates lost their chief support. The violence of the Scottish archbishops had also been artfully fomented by Lauderdale, till it reached a crisis destructive to themselves. A milder administration succeeded, and the nation began to breathe again under the auspices of Tweeddale, Kincardine, and sir Robert Murray, and enjoyed for a time, if not the blessings of liberty, at least those of a humane and impartial government. After the fall of Clarendon, the most unprincipled part of Charles's reign was yet to be acted. Clarendon is accused of having connived at his receiving money from France unknown to his people; but this heavy charge is not proved against him, (adduced by Dalrymple in his *Memoirs*.) That Charles had been, from the first years of his reign, guilty of this meanness, is, however, certain; and in the beginning of the year 1670, he signed an agreement with Louis XIV., by which the king of England was to receive 200,000*l.* a year, and the king of France was to assist in establishing Popery and despotic power in England: both were to unite in the plan of destroying the Dutch republic. In the very year that Charles signed this infamous treaty, the commons, deluded by his declarations about the triple alliance, voted him between 200,000 and 300,000*l.* No one as yet suspected the fraud that was carrying on. Lord Lucas was the first public speaker, who had the sagacity to discover, and the boldness to express in the House of Lords, while the king himself was present, the absurdity of this useless waste of the public money, and to demand why the maintenance of the triple alliance needed such supplies.

It may naturally be asked, who were the king's ministers at this disgraceful period? After the dismissal of the old royalists, the administration of the Cabal succeeded, so named from the initial letters of the five names, Clifford, Arlington, Buckingham, Ashley, (afterwards Shaftesbury,) and Lauderdale. Those men, it is probable, were all ready to betray their king as well as their country; yet it is certain that Charles betrayed them, keeping from some of them the real state of his connection with France, and of what he was pleased to call his religion.

The Cabal, however, had the guilt and disgrace of commencing the second Dutch war; although Charles concealed from them the secret of his bribe from France, for fear they should demand a share of it. The recall of sir W. Temple from the Hague, and the appointment of Downing, who was odious to the Dutch, announced the unalterable intention of England to quarrel. The grounds of the quarrel on the side of England were, that a whole Dutch fleet had refused, upon their own coasts, to strike their sails to a small English unarmed yacht. But the public of England did not participate in this crime of their government; it was even necessary to prorogue parliament, lest the general opinion

should be expressed. Such was the public feeling, that when the Dutch deputies were sent to beg peace from Charles, the people of England followed their coaches with tears, and the court was obliged to remove them to Hampton, from the eyes of the public; a device which only increased the general pity.

A variety of events gave notice to the English, that the war against Holland was but a part of Charles's scheme for the destruction of the Protestant faith and liberty. When he wanted more money, and dreaded to apply to parliament, he seized the issues of the exchequer; a measure which filled the mercantile world with bankruptcy and distress.

The duke of York, already deeming himself independent of public opinion, had openly declared his conversion to popery; and Charles, for the sake of the professors of that religion, issued a declaration of indulgence of conscience, and asserting a dispensing power in the crown. No pretence of toleration could reconcile the English to this usurpation; for it was justly said, that if the king could dispense with one law, he might dispense with all; and the pretence of general toleration was known, besides, to be a false one. In the mean time, the Dutch, attacked by Louis by land, and by the navies of England and France by sea, and deserted by Sweden, seemed on the point of being sacrificed. Louis's declaration of war had at least a bold and open, although a shameless effrontery; Charles's declaration was not issued till he had attempted to pilfer their Smyrna fleet from the unfortunate republic, and after he had been disgraced and disappointed in the attempt. War was declared with Holland on the 17th of March 1672; and in May, the combined fleets of France and England were attacked by De Ruyter, when a dreadful but indecisive battle ensued, in which the loss, though nearly equal, was rather heavier on the side of the English. At night the Dutch retired, and were not followed by their opponents. On that day perished the gallant admiral Sandwich, on board his own ship, which took fire: though warned of her state, he preferred death to surviving an unmerited reflection on his courage, which the duke of York had basely and undeservedly thrown out. Three other engagements were fought in the course of this war, during the succeeding year 1673; two off the sands of Schonvelt, and another at the mouth of the Texel. In this last combat, the famous De Ruyter and Tromp were opposed to the English admirals prince Rupert and Sprague; and Sprague was drowned in the action by a shot which sunk his boat, as he was passing to hoist his flag on board a third ship, after two in which he fought had been torn to pieces. But the engagement was, like all those of the second Dutch war, bloody but indecisive.

The Dutch had, during these events, appealed in vain to the remorseless hearts of Charles and Louis for pity and peace. The terms offered by Louis would have utterly annihilated their independence: those offered by Charles were, if possible, more insulting. After this refusal, despair and popular fury drove them to perpetrate the sacrifice of the De Wits, a tragedy which is at once the foulest blot in their history, and yet the prelude to its most glorious events. The prince of Orange, on whom the sovereignty of his country and its forlorn hopes were fixed, replied, with just elevation of soul, to Charles and Louis, when they told him that he should live to see his country undone, "*No! I shall die in the last ditch.*"

The English, as well as Dutch, were indebted for the speedy assertion of their liberties, to the spirit of the English parliament during 1673. They plainly told Charles, that he had no right to the dispensing power which he had claimed in his declaration of indulgence; and when he gave an ambiguous answer, they insisted on a more explicit one. They prepared to attack his ministers. The famous test act against popery was passed, which struck the staff of lord high treasurer from the hand of Clifford, and that of lord admiral from the king's brother. Charles declined a conflict with his parliament, and revoked his dispensing claim. But when his ministers found that he intended to expose them to the vengeance of parliament, the cabal made the same turn with their master. Shaftesbury, saying aloud, that the prince who forsook himself deserved to be forsaken, put himself at the head of the opposition, and urged the repeal of those unconstitutional acts in which he had so deeply participated.

The parliament, which had adjourned in the spring of 1673, met again in October. Hitherto they had resisted the king in some material points, but their opposition, and even impeachment of ministers, was not conducted with that indignation at the Dutch war, which it is certain was felt throughout the nation. In the session which commenced in October, a more decided spirit appeared. They remonstrated with anger at the proposed marriage, which was now negotiating between the duke of York and a princess of Modena. They voted the standing army a grievance, and declared that they would grant no more supplies, unless it appeared that the Dutch were unreasonable in their terms. To cut short these disagreeable altercations, the king resolved to prorogue the parliament, and with that intention went unexpectedly to the House of Peers, from whence he sent the usher of the black rod for the commons to attend. It happened that the usher and the speaker met nearly at the door of the house, but the speaker being within, some of the members suddenly shut the door, and cried, to the chair; on which the following motions were tumultuously made: that the alliance with France was a grievance, that the evil counsellors of the king were a grievance, that the earl of Lauderdale was a grievance; but as the usher knocked violently at the door, and the speaker leapt from the chair, the house rose in great confusion.

Parliament had been prorogued to give the duke of York time to finish his marriage, but the king's necessities obliged him to call them again. By their unaltered sentiments, the king saw that he had no more hopes of supplies for so odious a war. He therefore affected to be guided by the wishes of his parliament, and by their advice concluded a peace with the Dutch. All possessions were restored to the same condition as before the war; the honour of the flag was ceded by the states, who agreed also to pay nearly 300,000*l.* to the king. A body of English troops still remained in the employment of France, which Charles said he was prevented by treaty from recalling; but he secretly promised the Dutch that they should not be recruited, a promise which he was not honest enough to keep.

The interval from the separate peace between England and the United Provinces, to the peace of Nimeguen, was chiefly employed by Charles in attempts to obtain money from France; in which he was sometimes more, sometimes less successful, and in various false professions, promises, and other devices to deceive his

parliament and his people, in which he uniformly failed. Though neither the nature and extent of his connection with France, nor his design of introducing popery into England, were known at that time, as they now are, yet there were not wanting many indications of the king's disposition, and of the general tendency of his designs. Reasonable persons apprehended, that the supplies asked were intended to be used, not for maintaining the balance of Europe, but for subduing the parliament and people who should give them; and the great antipathy of the bulk of the nation to popery, caused many to be more clear-sighted in discovering, and more resolute in resisting, the designs of the court, than they probably would have shewn themselves if civil liberty alone had been concerned.

In the interval already mentioned, the commons twice addressed the king against the marriage of the duke of York with the duchess of Modena, although it was already celebrated by proxy. They drew up votes and addresses against standing armies. Nor were the efforts of parliament confined to the army alone; they addressed against national grievances, against the king's ministers, they examined Buckingham and Arlington at their bar, they complained repeatedly against Lauderdale, they prepared to impeach Danby, and supplies were refused almost as often as they were asked. The king, on the other hand, endeavoured to oppose the sentiments of liberty, by setting on foot a bill in the House of Lords, for imposing the oath of non-resistance on members of parliament, and on all in public stations. But after it was carried through the lords, Charles found he could not venture it in the commons.

In vain Charles hoped, by giving his brother's daughter in marriage to the Prince of Orange, to recover the popularity which he and his brother had lost. While the minds of men were agitated by the obvious designs of Charles, by abhorrence at the bigotry of the duke, and by a general consternation for the safety of the Protestant religion, the rumour of a *Papish plot*, for the universal massacre of the Protestants, gained a ready and too facile belief. The reporters of this design were obscure persons. Kirby, a chemist; Tong, a weak credulous clergyman; and Titus Oates, likewise a clergyman, but one of the most abandoned of miscreants, deposed to an account of a plot formed among the Papists, for burning London, putting the Protestants to death, and assassinating the king and his brother. By making the king an object of the pretended assassination, the suspicion was prevented of its having been forged by the contrivance of the disaffected. The alarm spread instantly over the nation; accident after accident, arising in a manner unparalleled in history, concurred to maintain the delusion; letters were seized, which discovered the duke of York's correspondence with France, against the religion and interests of his country; Danby's correspondence was also detected, which involved Charles in similar disgrace. Above all, the murder of Godfrey, who, in his office of magistrate, had made public the plot, made every Protestant imagine he felt the dagger at his throat.

This plot was greedily adopted as an engine against the court, by the popular party; more, it may be believed, from blind credulity, than from deliberate injustice; yet the proceedings that were founded upon it were truly disgraceful. Coleman, father Ireland, Grove, Pickering, and other innocent men, suffered death for the supposed conspiracy, on the contradictory testimony

of incredible witnesses, and after trials in which the judge and juries seemed to be the abettors of perjury. For two years, the Protestant credulity and vengeance were satiated from time to time with such legal murders, till the execution of the venerable Lord Strafford called forth some pity and remorse in the public mind. In the midst of these furious proceedings, the parliament, which had sat for 17 years, was dissolved. The succeeding one was actuated by the same immeasurable hatred of Popery on the one hand, which throws so much discredit on their judgment and charity; and, on the other hand, by a jealousy of the king's power, and a regard to the cause of civil liberty, which, though debased by its connection with baser prejudices in religion, was ultimately conducive to the greatest public good. It is to this parliament that we are indebted for the Habeas Corpus act, the most important barrier that was ever raised against the personal oppression of the subject in a modern or ancient commonwealth. The standing army, and the king's guards, were in the same session voted to be illegal. But the inefficacy of mere laws in defence of the subject, when opposed to unprincipled administrations, had been so sensibly felt, that the commons justly deemed their work incomplete unless the duke of York were excluded from the succession to the crown. A bill, therefore, for the purpose of excluding him was prepared, and passed the House of Commons; but being vigorously resisted by the court, by the church, and by the Tories, it was lost in the House of Lords. The restrictions offered by the king to be put upon a Popish successor, are supposed to have been among the most powerful of those means to which he was indebted for success in opposing the bill. During these agitations, the duke of York, at the king's desire, had retired to Brussels; but an indisposition of the king's brought him back to England, to be ready in case of any similar accident, to assert his right to the throne. After prevailing upon Charles to disgrace his natural son, the duke of Monmouth, who had become exceedingly popular, James retired to Scotland, under pretence of quieting the apprehensions of the English nation, but in reality to strengthen his interests in that part of the kingdom. This secession served still more to inflame the country party, who were strongly attached to Monmouth, and were resolved to support him against the duke of York.

The milder administration in Scotland, which had taken place under Tweeddale and Murray, was of short continuance. Lauderdale, at first the friend and associate in government of those Scottish patriots, and a favourer of the Presbyterians, abandoned the interests of his country and humanity, and his administration relapsed into the same tyranny from which he had relieved it. The object of the court in sanctioning his oppressions, was to make Scotland, in its state of servitude, an instrument to accomplish the servitude of England; and it was an article in Charles's second treaty with the French monarch, to which Lauderdale was privy, that the Scotch army was to be brought to co-operate with the French troops for the establishment of Charles's

absolute power. In proportion as the severities of government increased, the field and armed conventicles of the Scottish Presbyterians grew more numerous. Yet it was not until these severities had been carried to the last extreme, it was not until the letters of intercommuning * had been issued, that law-burrows † had been taken out by the king against his whole subjects; and that 6000 lawless Highlanders had been let loose upon the low countries, which they filled with robberies, tortures, and outrage, in every shape. It was not, in fact, until an insurrection had been purposely excited by the government, that the persecuted conventicles had recourse to arms.

The conduct of Lauderdale, who was the chief actor in these scenes of violence, was completely approved and justified at court; but in consequence, probably, of the state of politics in England, at the time when the Whigs were strongest in the House of Commons, some of the grievances were in part redressed, and the Highlanders and law-burrows were recalled; but the persecution of conventicles continued, and indemnity was granted for every species of violence in suppressing them. After the assassination of Archbishop Sharpe by a troop of fanatics, who had been driven to madness by his oppressions, an act committed by a few individuals was imputed to the whole fanatic sect, (so the majority of the nation was called by government,) and those who attended field or armed conventicles were ordered to be indiscriminately massacred. A rising was at last produced in the west of Scotland, where the insurgents, though undisciplined peasants, defeated the infamous Graham of Claverhouse, afterwards Viscount Dundee, and took possession of Glasgow. The duke of Monmouth was sent with an army from England to subdue them; but, lest the generous mildness of his nature should prevail, he had sealed orders, which he was not to open till in sight of the rebels, but to fall upon them without previous negotiation. In pursuance of these orders, Monmouth attacked them at Bothwell Bridge, where the Scottish peasants, headed only by their clergy, were soon defeated. Four hundred were killed in the field, and a body of 1200, who surrendered at discretion, were preserved from massacre by the humanity of Monmouth.

During these troubles, the king had made a vain attempt to obtain a little popularity, by removing a prince who was odious to so large a part of the community, and by sending his brother James out of the kingdom. In vain, also, had he attempted to break the opposite party, by making their leaders, Sunderland, Halifax, and Essex, his ministers, and by framing a new council, into which a still greater number of the popular party was brought, and at the head of which Shaftesbury himself was placed. Charles made those men his counsellors, but he concealed from them his intentions, and his secret transactions with France, and gave his confidence to an opposite party. The duke of York, though abroad, still exercised an influence which became paramount after an illness with which the king was seized; on which occasion James returned, and persuaded his

* Letters of intercommuning, were writs of outlawry against those who failed to appear at the council, and confess their guilt in attending conventicles. At a moderate computation, 17,000 persons of either sex were objects of persecution on this charge.

† An individual, by an application on oath, may obtain, by the Scotch law, a law-burrows, corresponding nearly to swearing the peace against any one,—a process, which had hitherto been only applicable to individuals; a government swearing the peace against its subjects, was a new spectacle. By these writs, the persons were bound, under penalty of being outlawed, to do what was not in their power, to prevent conventicles.

brother to send Monmouth into the same banishment from which he had himself returned. As the parliament of 1679 was as strongly in the popular interests as their predecessors, Charles determined to dissolve it, and to call another in 1680.

After this, Charles, during eighteen months, avoided calling a new parliament, and employed the intermediate space in securing a great part of the nation in defence of his brother and himself; in dismissing from the ministry his popular ministers, Essex, Halifax, and Shaftesbury; and in increasing his army, by his brother's advice. The opponents of the court were, in the mean time, neither idle nor timid. Monmouth returned from exile without leave, and was received with joy and triumph by the people. Shaftesbury, the popular leader, at the head of a band of nobility, formed a project to impeach the duke of York as a Popish recusant. Addresses from bodies of the nobility, from counties, and from boroughs, against Popery, and petitions for a new parliament, came to the king from all quarters. These the court counteracted by procuring addresses from a party, which expressed their *abhorrence* of the petitioning Whigs; and the nation was divided into two violent parties of petitioners and abhorers. The commons of that parliament, which Charles thought proper to assemble in 1680, after these agitations, was as unruly as the former. Pressing, like their predecessors, for the favourite exclusion bill, they determined against granting all supplies to the king until it should be carried. Charles determined, therefore, to dissolve them, and sent his usher of the black rod for that purpose to the house, whilst they were blending an absurd resolution respecting the burning of London by the Papists, with another highly to their honour, for emancipating their fellow Protestants, the dissenters, from the intolerant laws still subsisting against them.

It was doubtful if Charles would ever call another parliament; but the support which he had received from the church party, determined him to try a new election, in spite of the popular majorities which had hitherto prevailed in the commons. He summoned the new parliament to meet at Oxford, a place remarkable for its loyalty; intending, by this preference, to shew his displeasure at London. But this innovation raised new objects of passion; for the king's aversion to his capital was construed into aversion at his people. In this fourth parliament of the present reign, the country party still prevailed. It consisted almost entirely of the same members, who chose the same speaker, and who instantly fell into the same measures,—the impeachment of Danby, the repeal of the laws against dissenters, the inquiry into the Popish plot, and the bill of exclusion. A dispute with this parliament respecting Fitzharris, an Irish Papist, who pretended to confess the secret of another popish plot, more tremendous than the last, gave the king a pretence for dissolving them. The king imprisoned Fitzharris; the commons avowed his cause, and wished to impeach him themselves, in order to protect him. This, however, was but the pretence for the dissolution. Charles had secured to himself a good pension from France, and was determined to have no more parliaments. This was, indeed, a condition on which he was base enough to receive his stipend from Louis. The measure of dissolution was exceedingly successful. The most flattering addresses poured in from all parts of the kingdom; the cries of divine right,

and indiscriminate obedience, for a time overwhelmed the voice of liberty; and men seemed to vie with each other, to have the greatest share in the glorious work of slavery,—by securing to the king for the present, and to the duke after him, absolute, unlimited obedience.

The whole history of the rest of Charles's reign, exhibits an uninterrupted series of attacks on the lives, liberties, and properties of his subjects. The character of the government appeared first, and with the most hideous features, in Scotland. Thither the duke of York had been permitted to go, after a temporary exile from Britain; and here he exerted, during his administration of that kingdom, a tyranny, if possible, more frightful than that of Lauderdale. The wretched remains of the fugitive Covenanters, now known by the name of Cameronians, from the name of one of their clerical leaders, having publicly abjured allegiance to government, their executions were conducted, wherever they were found, with every circumstance of torture and cruelty. The innocent were artfully involved in the sacrifice. Availing itself of the frantic and fanatical delusion which the cruelties of government had created, the privy council intermixed its tortures with the most ensnaring questions:—Was Sharpe's death murder? Was the rising at Bothwell's bridge rebellion? Is Charles a rightful king, or a tyrant? The victims of rage and suspicion, too sincere, or by torture made unable to prevaricate, were dismissed from their tormentors to the justiciary court, and from thence to the scaffold. James himself assisted, it is certain, at one of those tortures, from choice, when Spreul was exposed to the question, and endured it twice almost without intermission.

The most illustrious object of this tyranny, in Scotland, was the earl of Argyle, (son to the nobleman already executed in Charles's reign,) a man whose only fault seems to have been submission to the oppressive system under which his country had hitherto groaned, although that very submission sprung from a love of peace, rather than an approbation of its enormities. When a contradictory test of loyalty was prescribed by the Scottish parliament, Argyle accepted the test as a privy counsellor, with an explanation, that he took it as far as it was consistent with itself and the Protestant faith. For this explanation, he was brought to trial, and, by the most infamous perversion of the most innocent words, a charge of treason was made out against him. Nairn, a superannuated judge, who was brought at midnight to make a majority on the relevancy of the indictment, fell asleep while the proceedings were read, and was wakened to give his vote. A jury of Argyle's personal enemies brought him in guilty. Argyle escaped from prison, but sentence of attainder was passed against him. After the fall of the exclusionists, and the dissolution of parliament, the duke was recalled to England, but Scotland enjoyed no relief from the change of administration.

The Tories endeavoured to signalize their victory by similar judicial enormities in England. Shaftesbury was brought to trial for high treason, and the king himself condescended to solicit and to suborn witnesses against him. As far as swearing would go, the treason was made out by infamous witnesses. A London grand jury, however, acquitted Shaftesbury, and a shout of joy was given by the spectators in court when the verdict was announced. Colledge, an obscure sharer in the pretended conspiracy, was tried at Oxford, where opposite principles prevailed. His notes of defence were taken

from him on the way to trial, and he was condemned and executed by a jury predetermined on his murder. The populace, too, shouted at this verdict, for joy that a Whig was to be put to death, as those of London had rejoiced at Shaftesbury's acquittal. To give an account, as Mr Fox has observed, of all the oppression of this period, would be to enumerate every arrest, every trial, every sentence, that took place between the crown and the subjects. Pilkington, Colt, and Oates, were fined each 100,000*l.* for speaking disrespectfully of the duke of York. Sir Patience Ward, formerly mayor, who gave evidence for Pilkington, was sued for perjury, and condemned to the pillory; a sentence intended to deter all witnesses from appearing in favour of those who were prosecuted by the court.

That the subjugation of the people might be complete, measures of a more general nature were adopted. By the law of England, the validity of charters of corporations might be inquired into by a writ of *Quo Warranto*. The profligate judge Jeffreys suggested to the king, that most of them might be annulled by such an inquiry. First the charter of London, and then those of almost all the other corporations in England, were either forfeited, or extorted from their proprietors. By this direct outrage on the rights of subjects, a way was opened to have the choice of magistrates, of juries, and of members of parliament, subjected to the will of the crown. It is needless to mention on what frivolous grounds these actions were maintained and sanctioned by the corrupt judgments of the king's bench. The most trifling deviations from the terms of ancient charters,—the most insignificant offences against obsolete laws,—were made the pretences for forfeiting charters. The charter of St Ives was attacked, because the borough had four constables instead of three, and three serjeants at mace instead of two. One of the complaints against Oxford was, that the fair was held in one place instead of another.

While the duke of York in Scotland, and the king in England, were proceeding to the last aggression on the constitution, a band of friends had associated to consult what means were left, or what others might be devised, for delivering their country from the dreadful servitude into which it had fallen. The leaders of this secret association were Monmouth, Shaftesbury, Russel, Essex, Algernon Sidney, and Hambden, the grandson of the great patriot. As the evidence against this party was given by the basest of its partizans, when, from hopes of pardon they were led to mix falsehood with truth, the designs of the association must still be considered as doubtful. That they meant to levy war against the king, may be suspected, but is by no means certain.* That which is certain in this affair, is, that they had committed no overt act of treason, and that the condemnation of Russel and Sidney, who suffered for it, was a flagrant violation of law and justice. An inferior conspiracy was in the mean time held among the agents of Shaftesbury, in the city, who carried on projects unknown to Monmouth and the other six. They met at the house of Rumbold, an old republican officer, now a maltster, who possessed a farm called Ryehouse, and their conspiracy was from thence denominated the Ryehouse Plot. They had laid a plan, we are told, for assassinating the king; yet no concerted design, as Mr Hume acknowledges, had been laid, and the whole was little

more than loose discourse, the overflowings of their zeal and rancour. Before the conspiracy had been detected, Shaftesbury fled to Holland, and died. Keiling, one of the associates of the city, revealed the inferior plot, and others, who were arrested, confessed their associates; and some of the obscure partizans were executed, whose confession in death, it was hoped, would prepare the public mind for witnessing the executions of Russel and Sidney. The particulars of the fate and trial of those illustrious men, will be seen under the respective articles of their names in this work. Monmouth fled to the continent; lord Grey was arrested, but escaped from the messenger; Howard, who was found concealed in a chimney,—a lurking place suited to the baseness of a wretch who turned evidence against Sidney and Hambden, suffered only by a large fine; and Essex, one of the greatest and most virtuous men of the age, fell by a voluntary death. Armstrong, one of the chief associates, was refused the common benefit of law to be heard by counsel; "You shall have the full benefit of law," said the Judge Jeffreys; "by the grace of God, you shall be executed upon Friday next."

Baillie of Jerviswood, a Scottish patriot connected with those in England, was sent to Scotland, where, contrary to the laws, written depositions, extorted by torture out of court, were read to the jury. He suffered with several of his countrymen; but most of the Scottish associates fled to Holland, and returned at the Revolution. Spence, the earl of Argyle's secretary, suffered the torture twice, and Carstairs for a complete hour, but neither would confess, till it was agreed that they should not be made evidences. Mr Gordon of Earlstone was brought before the council to be tortured, after he had been sentenced to death by the king's orders, but when the infernal engines were shewn to him, horror drove him instantly into madness.

The government of Charles was now as absolute as that of any tyrant in Europe; but as if to please his subjects by an act of popularity, he thought proper to marry the lady Anne, his niece, to prince George, brother to the king of Denmark. This was the last remarkable transaction of his reign. On the 2d of February 1685, he was seized with a fit of the apoplexy; and though he recovered his senses so far as to give a death-bed exhortation to his brother the duke of York, and to give a false declaration of his satisfaction in the Church of England, he expired in the end of four days illness, after a reign of 25 years, and a life of 55.

On the 6th of February, (the day of Charles's death,) his successor, James II., was proclaimed in London. It was expected, from his known principles, that he would make his brother's reign the model of his own. He declared to that effect in his first speech to the privy council, and his continuing Charles's ministers in his confidence, confirmed the declaration. Hyde, earl of Rochester, was appointed lord treasurer; Halifax, notwithstanding some suspicions of his having been busy in recommending a change of system to Charles, was continued in high employment; and so was Sunderland, although he had been at one time a favourer of the exclusion bill. Whatever personal objections there might be to some of these ministers, James supposed that, with the same servants whom his brother had employed in a reign which had almost eradicated the sentiments of liberty from the minds of Englishmen, he

* Fox's Introductory Chapter to the Reign of James II. p. 46.

could hardly fail in the great object of his views, *to be arbitrary*. For establishing this favourite project, an intimate connection with the court of Versailles being the principal engine, James early applied to Barillon, the French ambassador, with an indirect and timid hint at his necessity for pecuniary assistance. Five hundred thousand livres were speedily remitted, and James, if the French ambassador is to be believed, received the gift with tears in his eyes. It had been for some time Louis's favourite object to annex to his dominions what remained of the Spanish Netherlands, as well for their own value, as to second his views upon Holland; and this object Charles had bound himself by treaty with Spain to oppose. The first fruits which France reaped from the bribe, was to obtain from James a dereliction of the Spanish treaty. The principal agents in this business, besides the king himself, and lord Churchill, who acted a subordinate part, were Sunderland, Rochester, and Godolphin. It is with difficulty the reader can persuade himself, that these were the Churchill and Godolphin who, the one in the senate, the other in the field, redeemed this subserviency to baseness, by their glorious efforts in the war of the succession.

The king having first informed the French ambassador, and apologized for a measure apparently at variance with his engagement to France, to support an arbitrary government, issued proclamations for meeting a parliament. He, at the same time, issued orders for levying, upon his sole authority, the customs and other duties which had constituted part of the late king's revenue, but to which, the acts granting them having expired with the prince, James was not legally entitled. So servile was the spirit of the nation, that addresses poured in from all quarters, expressing the highest approbation of this direct and daring outrage on the constitution.

Previous to meeting his English parliament, James directed a Scottish parliament to assemble at Edinburgh, where the spirit of loyalty, as the base and slavish spirit was then called, was not confined to words: Acts were passed to ratify all the late iniquitous judgments; to indemnify the privy council, judges, and all officers of the crown; to authorize the privy council in imposing the test (under whatever penalties they chose;) to punish with death the hearers and preachers of house, as well as field conventicles, and even those who refused to be witnesses against them. The executive government of the same country, scorned to be outdone in cruelty by the legislative. A refusal to abjure the declaration, in the terms prescribed, was cause for immediate execution. In one part of the country, information having been received that a corpse had been buried, an enquiry took place—it was dug up, and found to be that of a person proscribed. Those who had interred him, were suspected, not of having murdered, but of having harboured him. For this crime, their house was destroyed; the women and children were driven out to wander as vagabonds; and a young man belonging to it was executed. In another county, three females, one of sixty-three years of age, one of eighteen, and one of twelve, were charged with rebellion, and refusing to abjure the declaration, were sentenced to be drowned. The last was let off, upon condition of her father's signing a bond for a hundred pounds. The elderly woman bore her fate with the greatest constancy. The girl of eighteen was more pitied, and, after many intreaties, and having been once under water, was prevailed upon to utter some words, which might be fairly construed into bless-

ing the king, it was thought she was safe; but the merciless barbarian, who superintended this business, was not satisfied, and upon her refusing the abjuration, she was again plunged into the water, where she was suffocated. It is to be remarked, that being at Bothwell bridge, and Airmoss, were among the crimes stated in the indictment of all three, though, when the last of these affairs happened, one of the girls was only thirteen, and the other not eight years of age.

The king met his English parliament on the 19th of May, and their proceedings were marked by a servility almost equal to that of Scotland. Without adverting to an unqualified menace, which the king held out to them in his speech, of making the frequency of their meetings dependent on their behaviour, *i. e.* their supplies to him; and, without noticing the illegality of the king's levying the revenue, that revenue was granted. The king's assurance was recognised as a sufficient security for the national religion, and the liberty of the press was destroyed by the revival of the statute of the 13th and 14th of Charles. In a bill which was passed for the preservation of the king's person, it was made treason to assert the legitimacy of Monmouth's birth, or to propose, in parliament, any alteration in the succession of the crown.

In his first address to this parliament, James had been obliged to announce to them the intelligence of Argyle's having landed in Scotland, and there erected the standard of insurrection. The unjust sentence of this nobleman, (whose real offence was his having insisted, on the occasion of the test, that the royal family should not be exempted from taking it,) and his escape from prison having been already related, the duke of Monmouth, whose share in the cabal, to which Sidney and Russel were martyrs, has been also mentioned, had been naturally drawn, during his exile in Holland, to a connection of designs with Argyle, and the other banished patriots both of Scotland and England. The chief of these exiles were Fletcher of Salton, Hume of Polwarth, and Sir John Cochrane, Scotsmen; Lord Grey of Wark, and Rumbold, a maltster, from whose house the Rye-house plot took its name, were the most distinguished Englishmen in the enterprise. When these men had consulted on the project of redressing the sufferings of their native country and themselves, Argyle's counsel, backed by Lord Grey and Monmouth's other advisers, and opposed by none but Fletcher, was to invade the two kingdoms at one time. It was so determined, and Argyle had a loan of 10,000*l.* from a rich widow in Amsterdam, and Monmouth had raised some money by his jewels. Argyle and his Scottish friends, together with Rumbold the maltster, sailed from Vly in three small vessels, and, taking a circuit round the Orkneys, were discovered long before they made a landing, which was at last effected on Argyleshire. Here Argyle was joined by some of his clan; and his numbers at one period amounted to 2000. But being overrated in all his plans by his own officers, and unable to establish himself in Argyleshire, he passed the Leven a little above Dumbarton, and proceeded eastward towards Glasgow, rather yielding to the despair of others than led by his own hopes. When his forces reached Kilpatrick, after narrowly escaping from a formidable body of the king's forces, his numbers had fallen off to 500, and he was at last left deserted and almost alone, by the resolution of Sir Patrick Hume and Cochrane, to cross the Clyde, with such as would follow them, and proceed into Renfrewshire. Unable to conceal himself, or to effect his retreat, to his own

country, where he still cherished hopes of making a stand, he was at last seized in the habit of a countryman, conveyed to Edinburgh, and consigned to execution. Monmouth set sail from Holland shortly after Argyle, and landed at Lyme in Dorsetshire, on the 11th of June. Here he published a manifesto, proclaiming James a tyrant and usurper, and promising to the people the renovation of short parliaments, the restoration of charters, a militia to be governed by the parliament, and a general toleration to Protestant dissenters. From scarcely an hundred, his followers soon rose to the number of 6000, and he now did not hesitate to proclaim himself king. At Taunton, the people strewed his way with flowers, followed him with acclamations and prayers, adorned their walls with green boughs, and threw open their houses to his army. But these were delusive promises of success. He was joined by none of the superior gentry. His slow approach struck no terror, but gave time for his enemies to prepare; and he unfortunately lost Fletcher of Salton, the only man of commanding genius in his army, in consequence of that gentleman having rashly killed a citizen in a dispute. James, in the mean time, got his army increased to 15000 men, and obtained from parliament a grant of 400,000*l*. After some unimportant skirmishes with the king's troops, and a variety of movements, which marked his indecision and perplexity, Monmouth at last determined to risk his fortunes in a pitched battle with the forces of the king's generals, Feversham and Churchill, who were posted to receive him at Sedgemoor, in the neighbourhood of Bridgewater. Here his undisciplined troops drove the royal infantry from the ground, and seemed on the point of complete victory, when the cowardice of Grey, who commanded the horse, brought all to ruin. That worthless nobleman fled at the first onset; and the rebels being charged in flank, were slaughtered, during an unavailing resistance, for three hours, during which they lost about 1300 men. Monmouth fled above twenty miles from the field of battle, till his horse sunk under him. He then alighted, and exchanging clothes with a shepherd, fled on foot with a single attendant, till, exhausted with hunger and fatigue, they both lay down in a field, and covered themselves with fern. The country was searched with bloodhounds, and James at last had the satisfaction of hearing that his nephew was found in a ditch, half concealed by weeds, with some raw peas in his pocket, a sustenance on which he had fed for two days. He burst into tears when seized by his enemies. For some time the unfortunate Duke sought his life with importunity; but, when James received his entreaties with all the sternness of his implacable character, he recovered himself with dignity, and behaved, in his last moments, with magnanimity, though persecuted on the scaffold by his religious assistants. The executioner struck the blow so feebly, that he only slightly wounded him; and Monmouth raised his head from the block, and looked him in the face, as if to upbraid him, but said nothing. After two other ineffectual blows, the executioner threw down the axe in horror, and declared he could not finish the deed. The sheriff's threatened him; he was forced to proceed; and, at two more strokes, severed the head from the body. He perished in his 36th year.

The most vindictive inhumanities were practised by government on the unfortunate prisoners taken at Sedgemoor. Immediately after the battle, Feversham hanged above twenty, and was proceeding in his executions,

when the bishop of Bath and Wells informed him that those unhappy men were now by law entitled to a trial, and that their execution was absolute murder. Kirke, who hung up his victims with the same avidity, when he saw the feet of the dying shake, used to say they should have music to their dancing, and ordered his trumpets to sound, and his drums to strike up. Jeffreys, (now ennobled,) was the judge who tried the prisoners in the western circuit. This atrocious man was not satisfied with the sacrifice of the principals, but charged the juries also to search out the aiders and abettors of the rebellion; and those who, in compassion to the wretched fugitives, had let them be hid in their houses, were denounced as such. It is horrible to relate, that two women, Lady Lisle and Mrs Gaunt, were sentenced to be burnt alive literally, for such acts of compassion. James complained of the unpopularity which Kirke and Jeffreys had drawn upon his name; but he complained in the days of his misfortunes, and such cruelties seem to have been but too congenial to the nature of him, who could jocularly style the bloody career of his judge, "Jeffreys' campaign."

At the next session of parliament, in November, James assumed a still higher tone of language than he had hitherto used. He spoke openly of the necessity for a larger standing army, and for enabling popish officers to serve without taking the test. Lost as the public mind seemed to be to every feeling for civil liberty, the fears for religion, roused by this indication of the king's intentions, with respect to the Catholics, created some symptoms of independence in a parliament, the most submissive which had sat for 100 years. The commons ventured to address the king, on the necessity of quieting the fears of the people on the subject of religion, and to leave the extent of the supply unsettled till they should be satisfied as to the tests. The Lords were preparing to imitate their example; and a motion proposed by Compton, bishop of London, actually prevailed, that a day should be fixed for taking the king's speech into consideration; a motion, by which it was understood, that the king's exercise of the dispensing power should be examined by the peers. But James, alarmed at the first though slight symptoms of resistance, prorogued the parliament, after it had sat but 11 days, and never assembled it again. He soon after dismissed many of his servants and officers, who had voted against his measures. After the prorogation of parliament, he established and regulated a perpetual camp at Hounslow Heath, under pretence of discipline and national defence, but, in reality, with a view to overawe the metropolis.

After the suppression of Monmouth's rebellion and the dismissal of parliament, James seems to have been so elated with his success, in establishing arbitrary power, that he proceeded without fear or caution in the second great object of his views, the establishment of the Catholic religion. His exercise of the power of dispensing with the test, that security which all Protestants believed to be the chief barrier against the introduction of popery, was systematically employed to throw every place of honour and emolument under government into the hands of Catholics; and besides offering the lure of offices, the king was active and zealous in making converts. Sunderland, ever versatile and unprincipled, continued in favour by becoming a convert to the king's religion; but Rochester and Clarendon, James's own brothers-in-law, though sufficiently subservient to his arbitrary views in civil government, were dismissed from

office for their obstinacy in religion. Four Catholic Lords, Powis, Arundel, Dover, and Bellasis, were admitted into the Privy council, and these, with Father Petre, the queen's confessor, and James himself, formed a Catholic cabal of seven, who had the whole administration of government.

In Ireland the mask was more completely thrown off, where Talbot, earl of Tyrconnel, in his fury for the Catholic cause, broke the Protestant officers, disbanded the soldiers, and disarmed all the natives of that faith, let loose a Popish banditti to prey upon the inhabitants, and exposed the kingdom to all the terrors of another massacre. The church was now alarmed; and that spirit of resistance which lay dormant, while the most sacred civil rights of the subject were suffering violation,* was awakened by the common fear of Popery, which drove the Tories and High Churchmen to coalesce, in their common danger, with the Whigs. The common resentment grew still stronger, when James, in violation of established law, issued a new commission, by which seven commissioners were invested with unlimited authority over the whole church of England. By this commission, a sentence of suspension was passed against Sharpe, a clergyman, for declaiming against Popery, and against the Bishop of London for having refused to suspend him,—a sentence which exasperated every true Protestant in the kingdom. Not contented with his suspending power in particular instances, the king issued a proclamation for a general suspension of all penal laws against non-conformity; an act of liberality, abstractly considered, but disgraced by the views of the tyrant who passed it. This was followed by a still more incautious display of his zeal in sending the Earl of Castlemaine as his Envoy to the Pope, for the purpose of restoring the church of England to the bosom of the ancient communion, by a solemn reception of the Pope's nuncio at Windsor, and of the regular Popish clergy in the habits of their order at court, and by forcing the universities to receive some of his most worthless proselytes to Popery into their benefices.

His dispute with the church was brought to a crisis, by his enjoining a second declaration of indulgence, which he ordered to be read by the clergy in all the churches. The clergy, who were known to disapprove of the king's illegal assumption of the dispensing power, almost universally refused obedience to this edict; and six prelates, Lloyd, bishop of St Asaph, Ken of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawney of Bristol, concerted with the primate Sancroft, a petition against the order, to the king. Though the petition (unexceptionable in itself) was privately delivered, they were summoned to appear before the council; and on refusing to find bail, were committed for sedition to the Tower. Never was the mind of the people so affected, as when they beheld those fathers of the church conveyed to their imprisonment. They were taken by water, to prevent the emotion which the sight of them might create in the city; but the people shouted when they perceived them at a distance; they threw themselves with reverence on the ground as they passed; and the very soldiers who were their guard, knelt and implored the blessing of their prisoners. Their trial for sedition, in framing the petition, came on in the King's Bench. They were attended thither by a train

of nobles and respectable commoners. The first counsel at the bar pleading for them, shewed that they felt the day and the cause to be the greatest for their country and themselves in which they should ever be destined to display their abilities—and the audience within and without—all London—all the nation—expected the decision with an awful and deep anxiety. The jury were enclosed all night, and in the morning gave a verdict for the prisoners. It was received with a shout of joy in the court; and almost in an instant, a thousand shouts were returned from all parts of London. These were continued from village to village, till they reached the army encamped on Hounslow Heath, which was seized with the sympathetic transport. The king was in lord Feversham's tent, and hearing the camp in an uproar, sent Feversham to enquire into the cause. He returned and said, it was nothing but the joy of the soldiers for the discharge of the bishops. "And do you call that nothing!" said the king. "*But so much the worse for them.*" A few days before the acquittal of the bishops, the queen was delivered of a son,—an event of joy to the king and Papists, and of present mortification to the people, who looked for eventual release from tyranny by the succession of the prince of Orange, but which, by rendering them more impatient of the yoke, accelerated that deliverance which they sought at their own hands.

The prince of Orange, James's nephew, had not been an impassive spectator of these events in England; but with his characteristic prudence, he forbore to intermeddle in the affairs of England, until the king's own misconduct, and the application of the English themselves, justified his interference. The king, conscious of the respect which attended William's name in England, solicited him to declare in favour of his dispensing with the penal acts; and threw out hopes to the prince, of his being seconded by the English arms in the league which he was forming against France. But William, justly distrusting his sincerity, and aware of the decided sentiments of the English on the subject of the tests, wisely refused to concur in his uncle's unpopular measures; and James's hints at a coalition with Holland, were speedily changed into warlike preparations, which menaced the republic. The prince was now assiduous in cherishing that spirit among the English, which led them to look for himself as their only and certain deliverer. Lord Dumblane, son of the earl of Danby, being commander of a frigate, made several voyages to Holland, and carried out tenders of duty, and even sums of money from many of the chief nobility; and Zuy-lestein, the Dutch envoy, brought him over the positive invitation, not only of the chief Whig leaders, but of the Tories also, to come and assist them with his arms for the recovery of their laws and liberties. The bishop of London, the earls of Danby, Nottingham, Devonshire, Dorset, the duke of Norfolk, the earl of Shrewsbury, these were some of the conspicuous persons who consented to bury their party feelings in his cause, and to devote their fortunes to his success. Even Sunderland, the king's favourite minister, privately promoted the cause at the expence of his personal honour. When William's preparations by land and sea, which had been dextrously made for pretended objects, so as to cover his designs on England, could no longer be concealed, James was warned by the king of France of the impend-

* The elections in several places were transferred from the people to the magistrates.

ing invasion, and an offer of troops was made to him by the French monarch to assist in repelling it. But James would not accept the offer: he trusted to filling the army with Irish Catholics, a measure which the resistance of the colonel and officers* of the first regiment on which he tried the experiment, and the mutinous aspect of the whole army, soon shewed to be impracticable. By his order, the major of Litchfield's regiment drew out the battalion, and required them to promise support to the king in repealing the penal statutes, or to ground their arms. To his astonishment, all but two captains and a few popish soldiers threw down their arms. James ordered them to take them up, adding sullenly, that for the future he would not do them the honour to consult them. When intelligence at last came from the English minister at the Hague, that the invasion of England was really intended, and avowed by the Dutch government, James, in a panic, tried to avert the wrath of his people, by restoring the charters which had been annihilated, annulling the court of ecclesiastical commission, and other acts; but as he revoked those concessions on the first news of a disaster having befallen the Dutch fleet, his sincerity was as much distrusted as his timidity was despised.

On the 21st of October, the prince set sail from Helvoetsluys, with nearly 500 vessels, and an army of 14,000 men. He first encountered a storm, which drove him back; but his loss being soon repaired, the fleet put to sea again under the English admiral Herbert, and on the second morning after it sailed, was discovered stretching towards the channel, with all the sail it could spread. The same wind detained the king's fleet near Harwich, and enabled the Dutch to pass the straits of Dover without opposition. Both shores were covered with multitudes of people, who, besides admiring the grandeur of the spectacle, were held in suspense by the awful importance of the enterprize. On the 5th of November, the anniversary of the gun-powder plot, the prince concluded his voyage, and landed his army in Torbay.

The Dutch army marched first to Exeter; but general as the invitation of the English had been, several days elapsed before they resorted to the standard of their deliverer. Sir Edward Seymour first made proposals for an association, which was universally signed. By degrees, the earl of Abingdon, Mr Russel, son of the earl of Bedford, and other gentlemen of distinction, came to Exeter; lord Delamere took arms in Cheshire; the earl of Danby seized York; the earl of Bath, governor of Plymouth, declared for the prince; the earl of Devonshire made a like declaration in Derby. The desertion of the army quickly followed. Lord Colchester was the first officer that went over; lord Cornbury succeeded in an attempt to bring over some troops of cavalry; lord Churchill, who had a high command, resorted to the prevailing party, and carried with him the duke of Grafton, natural son to the late king.

The falling monarch applied to Leopold, emperor of Germany, but received no favourable answer. His fleet was disaffected; and though he had yet an army of more than 20,000 men, he dreaded leading them to battle. He joined this army at Salisbury, and seemed for a moment resolved to live or die a king; but at the end of six days, he returned to London, and a skirmish having taken place between the two armies, a report that those

of James's being entirely defeated, accelerated the declaration of many in favour of William. The desertion of prince George of Denmark, and of his daughter the princess Anne, who being under the influence of lord Churchill, were persuaded to join the prince of Orange, struck down the tottering remains of his fortitude. In despair, he called a council of all the peers and prelates who were in London, and followed their advice in issuing writs for a new parliament, and in sending Halifax, Nottingham, and Godolphin, as commissioners to treat with the prince of Orange. In passing to the council, he asked the father of lord Russel (whose pardon he had prevailed upon Charles to refuse), for his advice and assistance. "I had once a son," said the venerable earl of Bedford, "who could have served your majesty on this occasion." James was struck speechless at the reply. Though the prince knew that these commissioners were in his own interest, he refused to give a satisfactory answer. Meanwhile, the insurrection spread over England, and every day some important accession was made to the popular cause. And as the contagion reached Scotland, the Papists and violent royalists in that kingdom fled or concealed themselves, and the Scottish privy council addressed themselves to William.

James's terrors now rose for his personal safety; and still more so, as the queen, alarmed at the general hatred which her religion inspired, and at the danger of a parliamentary impeachment, fled with her infant son to Gravesend, where a yacht conveyed her to Calais. The king, if he could be supposed, under the influence of such terrors, to cherish either hopes or designs, imagined he might throw the kingdom into anarchy by his flight. He threw the great seal into the river, and about 12 at night on the 10th of December, took a boat at Whitehall and crossed the river in disguise. He was attended only by sir Edward Hales, and two servants, and continuing his journey all night, arrived in the morning at Feversham. Near that place he was seized by some fishermen, who imagined his party were Popish priests flying from the country; and amidst the insults of the populace, was brought back to Feversham. At the inn of the village he was seen by a seaman who had served under him, and who melted into tears when he recognized him. The seamen of the place immediately formed a guard for his protection; but he was removed from their hands by the officers of the militia, by whom he was treated with less respect. The confusion which arose after the king's flight became known, was violent, but short, and was rather distinguished by terror than by outrage. All was calmed, however, by the bishops and peers assuming the reins of government. They chose the marquis of Halifax president of their council, issued orders to the fleet and army, and applied to the prince of Orange as to their expected sovereign, who was now on his march to London.

The prince of Orange advanced to London by slow marches, to shew that he was invited to the government, and did not hasten to seize it. But after he had reached Windsor, the unwelcome intelligence was brought to him of James having been stopt in his flight. The prince sent James a letter, forbidding him to approach nearer to London than Rochester; but the letter missed the king, who returned to London, and was welcomed with shouts by the senseless rabble. The

* Colonel Beaumont and six officers of the duke of Berwick's regiment.

prince of Orange then convened a council at Sion House, to deliberate what measures should be taken. It was resolved to send orders to James to remove from Whitehall to Ham; but as the terrified monarch preferred Rochester from its vicinity to the sea, and as William saw that he meditated an escape, he granted him his choice of residence. In the mean time, the Dutch troops entered London, and, as some resistance was apprehended from the obstinacy of lord Craven, who commanded the guards, they marched through the park at eleven o'clock at night, with drums beating, matches lighted, and in order of battle. James proceeded to Rochester with only five attendants of distinction;* and the prince of Orange arrived at St James's the evening of the same day. He received the congratulations of the clergy, the dissenters, the city of London, and the lawyers, and all ranks hastened to pay their respects to him.

The only authoritative body that yet subsisted since the dissolution of James's government, consisted of the peers and bishops, who, to the number of ninety, advised the Prince to summon a convention. But William, who was determined to obtain a more express declaration of the public consent, invited an assembly of all the members who had sat in any House of Commons of Charles II., (the only parliaments whose election was regarded as free,) and to them were added the mayor and aldermen of London, and fifty of the common council. By the advice of this body, in addition to that of the lords, the Prince summoned a convention. The conduct of the Prince, with regard to Scotland, was founded on the same prudent and moderate maxims. He called together the most eminent Scotsmen in London, about 80 noblemen and gentlemen; and he accepted a voluntary offer of the administration from that assembly, as from the fairest representation of their country, that could be found in the present place and circumstances. The English convention was assembled on the 22d of January 1689, which, from the influence of the present crisis, was composed chiefly of Whigs. In the peers, however, the Tory party was yet strong, and, after protracted debates, a conference of the houses was necessary, before the vote of the commons could be adopted, that James had abdicated the throne, and that it was thereby vacant. While the Tories were endeavouring to avert this decision, and proposals of a regency were strongly urged, the Prince, who had entered into no intrigues, who had retained a magnanimous silence, and had disdained to bestow caresses on even the leaders of the party which favoured his accession, at length called together some of the chief members of parliament, and gave his sentiments on the state of affairs. He pretended not, he said, to interpose in the decision of parliament, to whom the free settlement of the nation belonged, but he had heard that a regency was proposed by some, and that others were desirous of the crown being settled on the Princess. If either of these schemes should be adopted, he declared, that he could not accept of so precarious a dignity, and must return to his native country, satisfied with the efforts he had made for England. This declaration produced its desired effect; the voice of the Whigs prevailed; and the convention passed a bill, in which they settled the crown on the Prince and

Princess of Orange, the sole administration to remain in the Prince: the Princess of Denmark to succeed after the death of the Prince and Princess of Orange; the posterity of the Princess Anne after those of the Princess Mary, but before those of the Prince by any other wife. The convention annexed to this settlement of the crown a declaration of rights, by which the powers of royal prerogative were circumscribed, and defined more narrowly and precisely than at any other period of the English government.

The revolution was not in Scotland, as in England, effected by a coalition of Whig and Tory. Balcarras and Dundee, the leaders of the Tories, withdrew in rage and terror from Edinburgh; and the Scottish convention having voted, by a bold and decisive resolution, that James had forfeited the crown, tendered it to the Prince and Princess of Orange. Of the kings who have deserved popularity, none perhaps ever possessed less than William, in proportion to his merit. He had been led, by policy as well as gratitude, to entrust the administration to Whigs. Halifax got the privy seal, Danby was made president of the council, Shrewsbury a secretary of state. Nottingham was the only Tory admitted into power; and even of that one admission, the Whigs complained. It was not possible to reward all the Whigs; and a few honours and trusts conferred upon the Dutch friends of the king, roused the accustomed fury of the English against foreign favourites. The pecuniary supplies of William's first parliament were rigid, and below the acknowledged exigencies of government; nor would they countenance, but, on the contrary, fiercely opposed the noblest object of William's ambition, his wish to relieve his dissenting subjects from the sacramental test. All that he could obtain, was a partial toleration. The levity even of those statesmen, who had acted the highest parts in the late glorious revolution, and who had profited most by the change, was still more strange than the conduct of those who were chagrined by disappointment; if we can believe, that Halifax and Danby cabaled with the king's enemies, and declared the impossibility of keeping James from the throne, if he would concede certain points to the Protestants. The parliament, however, though divided in every other point, were unanimous in promising to support the king in a war against France. The measures of France, William declared, left now no choice but that of war on the part of England; and the empire, Spain, Holland, and the Elector of Brandenburg, were now united in curbing the ambition of Louis.

The parliament of Scotland soon displayed a more decided spirit of resistance to William than even the English parliament had shewn. William had instructed his commissioner, the Duke of Hamilton, (*Dalrymple's Memoirs*, p. 376.), to comply with the various demands of the Scottish convention in favour of popular rights; but Hamilton, from interested views, concealed from the boroughs the orders which he had received in favour of liberty; and the minds of the nation were alienated by this treachery, as well as by the king's refusal to proscribe and exclude the whole of the Tory party—a measure which the king saw would create a host of enemies from despair.

While the parliament was thus agitated, a civil war

* Lord Arran, son to the duke of Hamilton, lords Aylesbury, Litchfield, Dumbarton, and colonel Hamilton. On the 23d of December, in the night, attended by the duke of Berwick, and two other persons, he went to a small vessel which was prepared for him, and which carried him to Ambleteuse in France.

was excited by the Viscount Dundee, under whose new title and splendid achievements the cruelties of Grahame of Claverhouse were for a while forgotten. When the Scottish convention had declared for William,—when Balcarras, and the other leaders of the Tories, were secured in Edinburgh,—Dundee, more fortunate, escaped with fifty horse. He had left behind him the duke of Gordon in possession of Edinburgh castle; but, as that nobleman, despairing of relief, and pressed by a siege, was reduced to capitulate within a month, the cause of James in Scotland depended now upon his sole conduct. Dundee retired into the Highlands from the pursuit of general Mackay,—was joined by the Macdonalds,—surprized Perth,—and levied contributions to the very gates of the town of Dundee. Being joined by several of the mountain clans, he found himself, at one period, at the head of 1700 men; but, as the Highlanders, loaded with plunder, deserted in numbers, he retired into the wilds of Lochaber, and waited the arrival of succours from Ireland. When 300 recruits arrived from that country, Dundee once more called the Highlanders to his banners. With a force exceeding 2500 men, he gave battle, at the pass of Killycrankie, to Mackay, who, with considerably superior numbers, was advancing from Blair. By a rapid descent in thick and separate columns, the Highlanders overpowered the thin lines of Mackay, and would have scarcely left a man to report the defeat, had not the death of Dundee, in the moment of victory, left the command in less vigorous hands. Cannon, an Irish officer of indifferent abilities, succeeded him, whose forces, after a repulse by a single regiment of the Cameronians, dispersed, and returned to their homes.

These events took place during the summer of 1689. In the spring of the same year, James arrived from France at Kinsale in Ireland, where he found Tyrconnel, the lord lieutenant, devoted to him, and an army of 38,000 men in arms to support his cause. It may naturally be asked, by what neglect, on the part of William, the interests of the late king were allowed to assume so prosperous an aspect? and, indeed, the delay in settling Ireland is one of the parts of William's conduct which seem least to accord with the usual prudence and energy of his character. Since the period of James's flight from England, the Irish Protestants had beheld the increase of the lord lieutenant Tyrconnel's preparations with all the exaggerated terrors of an expected massacre by the Papists. The city of Londonderry, however, shut her gates upon his forces, and the whole of Ulster united in measures for their defence, and for continuing their dependence upon England. James was attended from France by about 2500 British and Irish followers, and 100 French officers. His reception at Kinsale was cordial, and his public entry into Dublin magnificent. About 10,000 Protestants gathered together around Londonderry, and an increasing number rallied themselves at Inniskillen.

Surrounded by the congratulations of Dublin, James ordered a parliament to assemble on the 7th May. Before it met, he quitted Dublin to lay siege to Londonderry, a town whose memorable siege will be described under a different article. (See LONDONDERRY.) The relief of the garrison by Kirke, gave a decisive blow to the fortunes of James, while the example of the besieged raised the emulation of the Irish Protestants. Six thousand of Tyrconnel's troops were soon after defeated at Newton Butler by a band of 2500 Inniskilleners;

and the courage of the Protestants rose in every quarter.

James's parliament, which assembled at Dublin, could only vote him a revenue,—they could not give it. By forcing a coinage of brass money to pass for fourteen times its value, he raised a temporary supply; but, as France refused him pecuniary aid, his adherents were supported by rapine; and, to increase his difficulties, the French auxiliaries were engaged in perpetual quarrels with the Irish. At last, on the 12th of August, William's army, amounting to 10,000 men, arrived from England, under the command of the aged duke of Schomberg; and, landing on the coast of Donaghadee, besieged Carrickfergus, and forced its garrison to capitulate. But the campaign of Schomberg was both short and indecisive. Encamping in a low and damp situation near Dundalk, his troops were wasted by disorder. The enemy, no less enfeebled by sickness, were fortunately little able to annoy them; and, at the approach of winter, both armies retired into winter quarters.

In the space of little more than a year after William was upon the throne, he broke with that parliament, and dismissed that party, which had placed him on it. Provoked at the hostility of the Whigs in his first parliament, he determined to call another, and to throw himself into the hands of the Tories. In the new elections, the Tories generally prevailed. The privy seal was taken from Lord Halifax, and Lord Shrewsbury resigned. After these changes, William announced his intention of conducting the war in Ireland in person. Leaving London on the 4th of June 1690, he arrived at Carrickfergus on the 14th of the same month. As he advanced, the Irish army abandoned Ardee, and fell back to the south of the river Boyne, where they were joined by James at the head of his French auxiliaries. William's forces, composed of English, French (French Protestants,) Dutch, Brandenburgers, Irish, and Danes, amounted to 36,000 men. James, having an army every way inferior, resolved, after much hesitation, to give battle; but took his measures rather for securing a retreat than to make a determined defence. William directed the river to be forded in three places, and the attack begun from as many quarters. Schomberg, with the right wing of 10,000 men, passed some fords up the river, and a bog on the other side, and attacked the forces of James, who rather watched than opposed him, and who fled to secure the pass of Dunleck, which guarded the Irish rear. The centre next crossed, and were maintaining a doubtful contest with their French and Irish opponents, when William, who passed the river farthest down with his cavalry, followed the army of James as it retired in a body around their king. While the armies were yet fighting, James rode off from the field of battle. The rout of the Irish soon after became complete; and they fled without obeying their sovereign's last injunction to defend the pass of Dunleck, leaving 2000 killed and wounded on the field. The day before the battle, William had received a slight wound by a shot which grazed his shoulder, from a cannon which the enemy privately brought and planted opposite to the spot where he was reconnoitring the ground; but the accident diminished neither the health nor spirits of the king, who, in the heat of the battle, was, as usual, at the head of his cavalry, with his sword drawn, and his arm thrown loose from its bandage. The remains of the Irish army retired precipitately to the Shannon; and the late king, determining to go to France,

took his leave of them, leaving orders behind him to continue their resistance.

The news of William's victory diffused exultation over the minds of the English, and came in good time to console them for the issue of a naval engagement which had mortified their national vanity. Torrington, with 34 English and 22 Dutch ships, engaged the French Admiral Tourville off Beachy Head. The Dutch, who had been most prompt in the engagement, were the greatest sufferers; but such was the state of the combined fleets after the battle, that they, next day, declined renewing it, and were obliged to retire into the Thames.

The king returned to England after the battle of the Boyne. General Ginckle, who commanded in his absence, pursued the Irish, now commanded by St Ruth, to the Shannon; crossed the river by a bold enterprise, and engaged their whole army at Aughrim, where the Irish were defeated with great slaughter, and driven to make their last stand at Limerick, after losing 5000 men.

The siege of Limerick commenced in August, and for six weeks the enemy made a gallant defence, and were not likely to make a speedy submission. With the plans which William had formed for the greater objects of warfare and ambition, the prospect of a winter siege, and the renewal of a spring campaign, in Ireland, were by no means desirable. He gave orders, therefore, to Ginckle, to make the Irish the most favourable offers. By the treaty of Limerick, therefore, which was soon concluded, the Irish were granted their pardons, their estates, and a general amnesty of debts, incurred during hostilities. Attainders and outlawries were done away. The Catholics were to receive the same toleration as under Charles II. Such as were inclined to go to France, were to be landed there, with their effects, at the expense of the English government. Fourteen thousand men, with arms in their hands, availed themselves of this last article, and consented to become, for ever, the subjects of a foreign power.

The defeat of Dundee subdued only the open enemies of the king in Scotland. An opposition to his measures was formed under the designation of the Club, or Country Party, and, among some of these,* a plot was laid for the restoration of James, by a coalition of the Jacobites and Presbyterians. The principal plotters were Montgomery, Ross, the earl of Annandale, and Ferguson, men who had zealously promoted the revolution, but who sought revenge for being disappointed of the rewards which they expected. But the plot was dissipated by the king's commissioner, Lord Melville, obtaining extensive powers to conciliate the Presbyterians by timely concessions. The king's supremacy over the church was given up, Presbytery was confirmed on its broadest basis, and preparations were made to indemnify the patriotic Whigs, who had been suffering under the late tyrannical reigns. The conspirators, in dismay, hastened to save themselves, by revealing the plot to government; and Montgomery, the principal plotter, died in exile, of grief and vexation. Nevil Pain, an English agent in the business, suffered the torture—he was the last victim of that inhuman practice in Scotland.—Otherwise, the suppression of the conspiracy was creditable to the humanity of government, and not a single life was taken. But

the double satisfaction arising from a plot being suppressed and popular grievances redressed, was quickly followed, in Scotland, by a lamentable and atrocious event, which forms the only indelible blot amidst the glories of William's reign.

Towards the end of 1691, the Highland Jacobite chieftains were intimidated by a severe proclamation, and hastened to disarm the resentment of government by submission. The last to submit was McDonald of Glencoe, who, after travelling in vain to the governor of Fort William, hastened to Inverary, but was delayed by the snows, and unavoidable interruptions on the road, till the time of grace was expired. The sheriff of Inverary, however, moved by his intreaties and tears, administered the oath of allegiance, and certified the cause of his delay. But his oath was industriously suppressed by the advice of Stair, the president of the Scotch court of Session, and the certificate was erased from the list presented to the privy council. The earl of Braedalbane, whose lands the Highland chief had plundered, and whose treachery to government, in negotiating with the Highland clans, Glencoe had also exposed, instigated the secretary Dalrymple, son to lord Stair, a statesman who had imbibed the bloody spirit of Lauderdale's administration, to co-operate with his savage resentment. They persuaded William that Glencoe was the main obstacle to the pacification of the Highlands, and concealing the circumstances in favour of the unfortunate chief, obtained orders for proceeding to military execution against his clan. Glencoe had remained unmolested, and confident of pardon, at home, when a detachment arrived from Fort William, under Campbell of Glenlyon, whose niece had married one of Glencoe's sons. The soldiers were received on promise of peace and friendship, and were quartered among the inhabitants of the sequestered vale, when their orders arrived at midnight not to suffer a man under 70 to escape their swords. The orders were obeyed with a dreadful strictness. The inhabitants were massacred in their houses; some roused from their beds, and others when sitting round their fires. Women were butchered with their children in their arms. Thirty-eight persons were thus sacrificed; but though the ends of the glen were watched, the rest escaped in a tempestuous night; the carnage, however, was succeeded by rapine and desolation, and the women and children stripped naked, were left to explore their way to some shelter, or to perish in the snows.

Willingly would the mind ascribe to the immediate agents of this horrid business, all the execration that is due to it, and transfer it, if possible, from one of the greatest and best of sovereigns; but, after all allowances, it is impossible to exculpate William from all knowledge and consent in the transaction. He was beset, indeed, with sanguinary ministers, and he was, in some degree, deceived and betrayed into an act of cruelty, inconsistent with the general tenor of his mild and merciful character; but no enquiry was made at the time, and no punishment was afterwards inflicted on the authors of the massacre.

The king having settled the affairs of the nation, went abroad in March to promote the measures of the grand confederacy against France. Whilst he was thus employed, the emissaries of James conveyed notice to the disaffected at home, that the late king was prepar-

* In the frantic plot of Montgomery, Ross, &c. it is probable that many of the country party were not implicated.

ing to make a descent upon England, at the head of 30,000 men, and that a French fleet which was to convey them would sail from La Hogue. The intrigues of James's friends had already been conducted within the verge of the court; a formidable party of the nobility was implicated in the present conspiracy; and, if we may believe the assertions of some writers, the Princess Anne, herself, sought to expiate her past conduct to her father, by infidelity to her sister. But the court of England was the easier informed of these designs, by pretended converts.* William, abroad, hastened the preparations of the Dutch, and detached several regiments from Holland. The measures of the queen's ministry at home, were prudent and spirited.

A camp was marked between Petersfield and Portsmouth; and the militia, both of England and Scotland, were called out. On the 18th of May, the combined fleets of England and Holland, consisting of 99 ships of the line, sailed from St Helen's. The main fleet of France, under Tourville, consisting of about 50 ships of the line, was at that time at sea, in quest of the English, and was descried next day, about three o'clock in the morning, seven leagues from Barfleur. By the good fortune and good plans of the English council, the four allied fleets had united before they sailed, a circumstance unknown to the enemy, who, trusting that they should meet the allies in divisions, had ordered Tourville to give battle wherever he found them. The French admiral, either trusting to the defection of the English seamen, or impelled by his peremptory orders and his high courage, bore down with his flag ship, the *Rising Sun*, of 110 guns, upon the English admiral, Russel; and the other ships following soon after, the engagement became general. About four in the afternoon, a thick fog parted the combatants, but a running fight was renewed in two hours, which was again closed by darkness. The chase was continued next day along the French coast. On the third day, Tourville, with a part of the remains of his fleet, fled to Cherbourg. Eighteen more of the enemy sought refuge near La Hogue, and others escaped through the race at Alderney. The English Admiral, Delaville, pursued and burnt several of the former, and then rejoined the commander in chief, who employed the subsequent days in attacking those ships which had repaired to La Hogue. They were now reduced to 13, but were covered by two forts, while the whole of the French army, and of James's followers, were drawn up on the adjoining shore. The ships themselves were drawn as far up upon the shallows as tides and cables could bring them. Nothing, however, could resist the British seamen, who crowded in barges, under cover of such frigates as could be brought sufficiently near, boarded the whole fleet, and climbing up the ships on one side, drove out the French with little resistance on the other, and then destroyed them. When James beheld the efforts of his late subjects thus employed against himself, he could not restrain his admiration of their gallantry; but exclaimed, "Ah, none but my brave English could do this!"

The victory of La Hogue overthrew, for the present, if it did not eradicate, the hopes of the Jacobites. William spent a considerable part of the succeeding year on the continent, in the conduct of those important

campaigns against Louis which do not belong properly to our history. The other warlike enterprizes of England, during the same year, were unimportant; the political struggles between William and his parliament were vehement as before, but did not impede the supplies which the commons, in the midst of complaints at the king's rejection of several popular bills, (the bill for triennial parliaments in particular,) still liberally granted. The king, who had, soon after his accession, thrown himself into the hands of the Tories, was induced, by the advice of Lord Sunderland, to recal a mixture of the Whigs into his councils. The effects of this change were displayed in the enactment of a bill for triennial parliaments in 1694, to which the king gave his assent; a renovation in the constitution, which unhappily was too soon forgotten. On the 28th of December, William was deprived, by death, of his consort Mary. She died of the smallpox in her 33d year, to the inexpressible grief of his majesty, who, for some weeks after her death, could neither see company, nor attend to the affairs of the state. The conduct of this princess has been taxed with want of natural affection, from the indifference with which she is said to have ascended the throne of her father, and witnessed his misfortunes; but it should be remembered, that William's marriage with her was founded upon affection, and that they had long lived in the most endearing connection of life, before the bigotry of her father precipitated him from the throne. She could not have deserted William; nor was she culpable to have endured with serenity the promotion of the cause of religion and human happiness, of which her husband was the leader. Her personal worth could not be small, nor her affections unamiable, to whom such a husband was so tenderly devoted.

The great business of parliament from this period seemed to consist in restraining corruption, and bringing to justice several offenders in high station, who had grown wealthy upon the plunder of the public. The number of laws that were now enacted every session, seemed calculated for the safety of the subject, but in reality, were symptoms of the universal corruption.

William was willing to admit all the restraints they chose to lay on the royal prerogative in England, upon condition of being properly supplied with the means of humbling the powers of France. Though a friend to liberty from inclination, he did not sufficiently understand the complex nature of the British constitution to keep its parts in harmony. But if he could not be said to yield to his parliament from patriotic motives, he at least made his concessions the exchange for the means given to support him in great and laudable objects. The sums of money granted him for the prosecution of this war were incredible, and the nation not contented with furnishing him with such supplies as they were immediately capable of raising, involved themselves in debts, which have since accumulated so formidably. For this profusion it has been remarked, that England gained only the reward of military glory in Flanders, and of saving the Dutch. But to have checked the career of France, and to have prolonged for a while the independence of Europe, was certainly to have attained great objects.

The treaty of Ryswick at length put an end to this

* It must be supposed that some of the Whig lords entered into James's designs only to discover and betray them to William. It is certain that James distrusted many of those new and secret adherents, and that William confided in them in the moment of danger. The most fortunate circumstance for the nation was, that Russel, the most important partizan, would not consent to abstain from fighting the French fleet, if he should meet it, with the king himself on board.

war. William returned to England in November 1697, and was received in London amidst the acclamations of the people. By the treaty of Ryswick, his title to the crown of England was acknowledged by France herself.

Amidst the distractions of foreign politics, William had little leisure or inclination to attend deeply to the domestic affairs of England, and still less to those of Scotland. An event now happened, which excited the most violent ferment in the latter kingdom. By the recommendation of Paterson, an individual of splendid and enterprising genius and views, a settlement was formed by the Scotch on the isthmus of Darien, a situation admirably fitted for accomplishing the most gigantic efforts of commerce, and for uniting the trade of the European, Asiatic, and American continents. Twelve hundred settlers, after founding New Edinburgh, the capital of their intended colony, proceeded for some time with hopes and alacrity in forming their settlement, and repulsed the Spaniards who attacked them; but the English immediately demanded of William the suppression of this colonial rivalry of the Scotch. Spain remonstrated against a settlement on her territories; and William, afraid of a breach with Spain, coincided with the angry jealousies of both nations. The supplies of the colony were cut off from home; and after eight months, it was abandoned through famine and disease. Before the evacuation was reported, a second and a third expedition had sailed from Scotland, but they were again, as before, attacked by the Spaniards; and though they gallantly repelled an army of that nation, they were forced to capitulate to a fleet from Carthage, on condition of being allowed to return home. The ships which were to bring them home, were unprovided for so long a voyage; and the few adventurers who survived, were left to languish in Spanish prisons, or to starve on English plantations. The Scottish nation awaked from its dreams of immense wealth, stripped of its credit, its resources, and its trade; and there was scarcely one family which had not to mourn a lost relation, or a ruined fortune in this calamitous business. In justice to the memory of William respecting this transaction, it ought to be remembered, that the Scotch colonists had no distinct right to settle in Spanish America; and that a war with Spain, unpopular among the English, would have been the probable consequence of pleasing the Scotch.

William returned from humbling his enemies abroad, only to be watched, distrusted, and humbled by his own subjects at home. As the project of humbling France was never distant from his mind, he had come to regard a standing army as indispensable in England. It is not impossible that his great mind, through the power of habit, and by constant practice in war, had acquired that love of military pomp and parade, which, in itself, is so unworthy of greatness. This passion for a standing army was, however, wisely checked by his parliament, who passed a vote for disbanding all his foreign troops, and reducing the whole army to 7000 men. The mortification which he felt on this occasion, is said to have inspired him for a time, with the resolution of abandoning the English sceptre and returning to Holland: his ministers, however, persuaded him to pass the bill for reducing the forces, and to change his resolution.

The rest of William's reign was employed in disputes with his parliament, which are not of the highest in-

terest, as they did not relate to the primary points in the constitution. The only warlike enterprise in which the nation embarked from the peace of Ryswick to the king's death, was in aiding Sweden, when the kings of Denmark and Poland, with the elector of Brandenburg, formed a league to crush the young Charles the XIIth. A fleet of thirty sail of English and Dutch was sent into the Baltic, under the command of sir George Rooke, who joined the Swedish squadron, and bombarded Copenhagen, to which the Danish fleet had retired.

The repose of Europe was again disturbed by the disputed succession to the Spanish monarchy. His Catholic majesty having, by his last will, bequeathed his whole monarchy to the second son of the Dauphin of France, the views of William, who had brought Louis himself to accede to the partition treaty, was wholly thwarted by the bequest of the Spanish monarch, and by Louis's acceptance of it. After some negotiations at the Hague had succeeded to William's remonstrances with Louis on his acceptance of the Spanish testament, it was evident that England and the States would speedily be obliged, by force of arms, to maintain the partition treaty, or submit to see the Spanish monarchy become a dependency of France. The emperor of Germany soon became an ally to the new confederacy against France, and a treaty was concluded between the three powers to secure a satisfaction to the emperor in the Spanish succession, and sufficient security for the commerce and dominions of his allies.

Amidst these negotiations, the late king James died at St Germain; he was comforted in his last moments by the promises of Louis to protect his son as the lawful monarch of England; but in the year before, the English parliament, by a resolution of greater effect, had debarred him from all hopes of the throne, by declaring the princess Sophia duchess dowager of Hanover, and her heirs, the next in succession to the princess Anne.

William, who was the soul of every confederacy against France, used to retire to his country seat at Loo in Holland, where he had leisure and tranquillity to mature his councils, and draw the plans of his campaigns. In the last year of his life, he returned from this retirement to the troublesome government of England, where, however, he found the parliament amidst abundance of quarrels and complaints, ready to second him in the active measures which he had projected. In the mean time, his constitution, feeble from his untimely birth, and oppressed by the cares and fatigues of government, sunk under a complication of disorders; but the immediate cause of his death was a fall from his horse in one of his excursions from Hampton Court, by which his collar bone was broken. He languished above a fortnight under an aguish fever, and expired in the 52d year of his age, of an inflammation in his lungs. His person was of the middle size, ill-shaped, and ungraceful, except on horse-back: his nose was aquiline; but the harsh features of his countenance, which was pale and solemn, were enlightened by the piercing lustre of his eye. His manners were silent, cold, and reserved; unfavourable impressions were sooner made on his mind than effaced from it; but his resentment never descended to the meanness of personal revenge. From a neglected education, he was insensible to the finer arts, and impatient, perhaps, of the minute details of public office; but his virtues were severe and exalted; his

mind was ever intent on great designs; he had a sound judgment in weighing events, an invention fertile in resources, calmness in battle and danger,—fortitude, fidelity, and above all, an attachment to public liberty. If any abatement is to be made from this illustrious character, it is in the government of Scotland that the most exceptionable part of his conduct appears; but there he was obliged to confide in statesmen, trained up in the abuses of bad government, who betrayed him into arbitrary exertions of power. And, even in Scotland, amidst the conspiracies of the Jacobites, not a single person perished on the scaffold, nor was there a noble family ruined by forfeitures during his reign.

The importance of William's life was evinced by the joy that diffused itself through France at the news of his death: They could hardly restrain their joy within the bounds of decorum; and there were public rejoicings in Paris. When it was known in Holland, the States immediately assembled; for some time the deputies gazed at each other in silent fear and astonishment: They then sighed, wept, and interchanged embraces and vows, that they would act with unanimity, and expend their dearest blood in defence of their country.

William was succeeded by the princess Anne, who had married George prince of Denmark. She ascended the throne in the thirty-eighth year of her age, to the general satisfaction of all parties. She had been taught by her relations of the Clarendon family to favour the Tories; but the influence which the countess of Marlborough, whose husband headed the opposite faction, prevailed against Rochester, and those who opposed the war with France. When the privy council had therefore assembled and deliberated, the queen declared her intention of continuing warlike preparations, and abiding the cause of her allies. Her promise was confirmed by the arrival of the earl of Marlborough as ambassador to the states, who inspirited the Dutch, and concerted the operations of the campaign. By agreement, war was declared against France, in one day, at Vienna, London, and the Hague. Marlborough, who had been named by the queen commander of the forces both abroad and at home, was chosen by the allies generalissimo of the whole army. An indefatigable warrior in the camp, and a skilful politician in the court, he became the most fatal enemy to France that England had produced since the days of Cressy and Agincourt. He had learnt the art of war under Turenne, in whose army he was known by the name of the handsome Englishman, and, from his early displays of skill and gallantry, Turenne himself had predicted his greatness. To this general was opposed, on the side of France, the duke of Burgundy, grandson of the king: a youth more fitted to grace a court than to conduct an army, but who was supported by the talents of the marshal Boufflers, his second in command. In the first campaign Marlborough repaired to the camp of the allies at Nimeguen, where he found himself at the head of 60,000 men. By motions at once bold and sagacious, he obliged the French to retire before him, without their daring to hazard a pitched battle; drove them out of Spanish Guelderland; and, having concluded the campaign by taking Liege, returned to reap his honours in London, where he was thanked by the House of Commons, and created a duke by the queen.

The national arms were less successful by sea. Sir John Munden was dismissed the service for suffering a French squadron to escape into Corunna. Admiral

Benbow, in the West Indies, attacked a squadron of the enemy; but, being supported by only one ship, through the cowardice or treachery of his captains, he fought with unavailing gallantry against superior numbers, till his own ship lay like a wreck in the water, while the enemy escaped. The captains Wade and Kirby, who deserted him, were shot on their return to Plymouth, and others of his officers were disgraced. An attempt was made upon Cadiz by a force of 50 ships of the line, under sir George Rooke, and 14,000 men on board, commanded by the duke of Ormond; but the troops were reembarked, after sending an ineffectual summons to Fort St Catharine. At Vigo, however, the same commanders retrieved their honour by the capture or destruction of 18 French ships of war, and the spoils of 11 galleons, with above a million of silver.

The glory of Marlborough's first campaign only incited the nation to aim at new triumphs. The House of Commons voted 40,000 seamen, and the same number of soldiers (an additional 10,000 were soon after voted) to act in concert with the allies; and Marlborough returned to the field with greater confidence and larger authority than before. He opened the campaign on the Rhine by taking Bonn, the residence of the Elector of Cologne; he next retook Huy, Limbourg, and became master of all the lower Rhine. In 1704, the presence of the Duke of Marlborough was loudly demanded by the emperor, who was pressed by the arms of France. Marlborough took with him about 13,000 English troops, advanced by hasty marches to the banks of the Danube, and, having defeated a body of French and Bavarians at Donawert, who were stationed to oppose him, crossed the river, and laid Bavaria under contribution. Villeroy, who had superseded the duke's late opponent Boufflers, could not watch, much less oppose, the active movements of the English commander. Marshal Tallard, however, prepared by another route to obstruct the Duke of Marlborough's retreat with 30,000 men; and, being joined by the Duke of Bavaria, those two generals, the most reputed in France, were now at the head of 60,000 disciplined veterans. On the other hand, the Duke of Marlborough was joined by the imperial general Prince Eugene, whose talents and designs coalesced admirably with his own. Their combined army amounted to 52,000. As the battle which ensued, both from the talents of the commanders and the discipline of the troops, is reckoned the most remarkable in the earliest part of the last century, it has been generally given in minute detail.

The French, under Tallard, were posted on a hill near the town of Hochstet; their right being covered by the Danube and the village of Blenheim, their left by the village of Lutzingen, and their front by a rivulet, the sides of which were steep, and the bottom marshy. In this strong position, they rather waited than offered battle; but Marlborough and Eugene resolved to attack them, and advanced upon a plain in their front. The cannonading began at nine in the morning, and continued to about half after twelve. Marlborough then passed the rivulet at the head of the English, and attacked Tallard's cavalry on the right. That general was, at the time, reviewing his troops on the left, and his cavalry fought for some time without his presence. It was an hour before prince Eugene could bring up his forces to attack the other wing of the enemy commanded by the Elector of Bavaria. When Tallard had repaired to the scene of Marlborough's attack, he found that the

French cavalry had been thrice repulsed, and had rallied as often. He had posted a large body of troops in the village, and attempted to bring them to the charge; but these could hardly maintain their ground, being furiously charged by a detachment of the English. All the French cavalry being thus attacked in flank, was totally defeated. The English army, already half victorious, pierced up between the two wings of the French, while the forces in the village of Blenheim were separated by another detachment. In this terrible situation, Tallard flew to rally some of his squadrons; but, from shortness of sight, he mistook a Hessian for a French corps, and was made prisoner. Prince Eugene, in the mean time, had been thrice repulsed on the left, but at last broke the enemy.

The French now fled in the utmost confusion, all but the corps of 13,000, who were surrounded in Blenheim, and obliged to surrender prisoners of war. About 12,000 French and Bavarians were killed in the field, or drowned in the Danube. One hundred colours, 200 standards, 3000 tents, and all the baggage and military chests of the French, were the trophies of Blenheim. Of the allies, 13,000 were killed, wounded, or missing; but the conquerors gained by this day an extent of 100 leagues of country. Marlborough, expert in the cabinet as in the field, repaired in person, after finishing the campaign, to other parts of Germany, to excite the powers in support of the emperor, and returned to England, deservedly welcomed by the transports of his countrymen. The manor of Woodstock was conferred upon him; and the Lord Keeper, in the name of the peers, honoured him with the praise he so well deserved. See **BLENHIM**.

Nor were the arms of Britain less fortunate by sea. By a conquest, of which the value was so little understood at that time as to be voted unworthy of thanks, Sir George Rooke and the Prince of Hesse took Gibraltar. The former commander, with a fleet of 52 ships of the line, engaged the grand fleet of France off the coast of Malaga; but the French, though they afterwards claimed the victory, retired when their van had been broken, and, as they would not hazard another meeting, the British had no decisive success.

The success of the second campaign in Germany, induced the English to increase their supplies for the third, and Marlborough fixed upon the Moselle for the scene of action; but being disappointed by Prince Louis of Baden, he returned to the Netherlands to oppose Villeroy, who, in his absence, had undertaken the siege of Liege. Villeroy, at the Duke's approach, retreated within his lines. Marlborough led on his troops to force them, and defeated the enemy's horse with great slaughter. The infantry being abandoned, retreated in disorder to an advantageous post, where they again drew up in order of battle. Had the Duke been permitted to take advantage of their consternation as he proposed, he might have gained a complete victory; but the Dutch officers would not consent to the charge; and the indignation of the English at their coldness in this business, may be reckoned one of the chief causes that alienated the affections of the nation towards their allies, and disgusted them at an expensive though brilliant war. The capture of Gibraltar had already signalized the British arms in Spain, where the greatest efforts were made to fix Charles, Duke of Austria, on the

throne, in opposition to Philip IV., the grandson of Louis XIV., who had been nominated successor by the late king of Spain. The greatest part of Spain had declared in favour of the latter prince; but Charles, supported by the allies, and invited by the Catalonians, was assisted by England with a fleet and an army.* The troops were commanded by the earl of Peterborough, a man of deformed shape, and diminutive stature, but of such romantic valour, that his services were reckoned equal to all the other aids that were lent to the Duke of Austria. The first attempt in Spain was to besiege Barcelona, a strong city, with a garrison almost equal to his own army. Never was an attempt more bold or more fortunate. The operations began by an attack on fort Monjuic, strongly situated on a hill that commanded the city. The outworks were taken by storm. A shell chanced to fall into the fort, and blew up the powder magazine, on which the garrison of the fort surrendered in consternation. But the town still remained unconquered. It, however, capitulated after a treaty. During the time of the treaty, the Germans and Catalonians, who acted with the English, entered the town, and plundered all before them. The governor complained to Peterborough of the breach of faith. Peterborough knew that the plunderers were not his own troops, but led on his English against them, drove them out, and returned to finish the treaty. His good faith and generosity facilitated the capitulation. The conquest of all Valencia was ensured by the capture of this place, which the enemy made a vain attempt to retake. The partizans of Charles flocked from every quarter; he subdued Arragon, Granada, and Carthage. The Earl of Galway entered Madrid in triumph, and proclaimed him king of Spain.

These successes were soon eclipsed by the triumphs of Marlborough in Flanders, during the campaign of 1706. The army of Villeroy, near Tirlemont, amounted to 80,000 men, and with these he had orders to attack the allies, whose numbers were nearly equal, before the Danish and Prussian succours should reach Marlborough. Villeroy, with the intention to be the assailant, was himself attacked in a situation which prevented him from exerting all his strength. With the river Meuse on his flank, his centre occupied the village of Ramillies; but a marsh was before his left, which Marlborough knew that he could not cross, and therefore bore down upon his centre. A victory, nearly as splendid as that at Blenheim, was obtained. About 6000 French were made prisoners, and 8000 were killed or wounded. The whole of Brabant was gained by the victors. Louis XIV., lately the tyrant of Europe, now trembled for the safety of his capital, and was saved from ruin only by dissensions in the English cabinet. The councils of the queen had hitherto been governed by a Whig ministry, who were sincere in the design of humbling France. But from different concurring causes, the influence of the Whigs began to decline, and the general disposition of the nation to lean to Toryism. Among allies it is difficult long to preserve unanimity; and already the English had conceived many causes of offence at their confederates in the war. Some of the writers of the Tory faction were men eminent in literature, and they inveighed incessantly against the personal ambition and selfishness of Marlborough and Godolphin, who governed the queen, and lavished the treasures and

* A fleet of 30 ships of the line and 100 transports, and 9000 men.

blood of the nation, in prolonging a war for the personal glory and private emolument of conducting it. Small as the taxes then were, the people were taught to consider them as insupportable. Amidst these causes of discontent, the genuine principles of Toryism had been also lately awakened, by some discussions respecting the toleration of the dissenters; and doctrines of tyranny, and passive obedience, were promulgated by those who inveighed against the war, worthy of the worst years of James and Charles II. As the queen's understanding was very limited, we may easily suppose, that these doctrines of the Tories made her more favourable to them than all their other complaints against the Whigs. The slightest misfortune in the war, was a sufficient encouragement to those who declaimed against its inutility. The loss of a battle in Spain, near Almanza, where the Earl of Galway was defeated and taken prisoner, with a large English force, dispelled the inebriation of former success. In consequence of this victory, all Spain, except Catalonia, returned to the dominion of Philip. Other disasters increased the national discontent. The Duke of Savoy and Prince Eugene were foiled in an attempt upon Toulon. A fleet under Sir Cloudesly Shovel, was wrecked upon the Scilly islands. While Marlborough was in the field, it is true, there might still be sanguine prospects of success on the continent; but though the Duke, in the campaign of 1707, drove the French before him from one post to another, and forced them to take shelter under the cannon of Lisle, and behind the Scheldt, yet he gained no general pitched battle, and his military genius suffered a diminution of renown, not that he had committed any fault, but that he had not dazzled the public eyes with such splendid achievements as those of Blenheim and Ramillies.

The leaders of the Tories were Harley, afterwards Earl of Oxford, and St John, afterwards Lord Bolingbroke. Harley insinuated himself, by his address, into the queen's favour, and ultimately succeeded in undermining the Whigs. St John, for a while, acted subordinate to Harley, although his lofty enterprise, ambition, and genius, made him at last the rival of his patron. When Marlborough and Godolphin perceived the increasing influence of Harley, they wrote to the queen, that they could serve her no longer should Harley continue secretary; and they even expostulated with their sovereign in a personal interview. The immediate consequence was, that the queen dismissed Harley, dreading to be abandoned by her other ministers; but the boldness of the Whig leaders secretly offended her, and promoted their own downfall.

The most important event of this reign, was the union that took place in 1706 between the two kingdoms of England and Scotland. This measure had been strongly recommended by king William, almost with his dying breath; and, as early as 1702, commissioners from both kingdoms had met at Westminster, but such difficulties occurred, that the treaty was then adjourned. It was resumed, however, within a few years; for, although the mutual jealousies of the two nations interposed many obstacles, it was of vital importance to both. To the present Whig ministers of England, it was desirable, as a matter of party, for the easier management of Scotland. It was recommended, however, by nobler prospects of advantage, in securing the Protestant succession; which, although settled by the English parliament, was still endangered in Scotland by various causes. The

Jacobites of Scotland were numerous: they spoke in Parliament in open opposition to government; and they derived strength by their pretences to patriotism, as well as by acting in connection with a really patriotic body in Scotland, those Whigs who had promoted the revolution, but who saw with indignation the interests of their country made subservient to those of England. Among these, the most distinguished was Fletcher of Salton, a man of high, untainted principles, the sworn enemy of arbitrary power, attached to the Protestant succession, but disdaining to call even that succession a blessing; while the trade of Scotland was shackled, her statesmen the venal tools of an English cabinet, and her whole existence made dependent on England. By the Country Party in the Scottish parliament, an act was passed, which menaced the English with a separate succession, by declaring that the same king should not succeed to the throne of Scotland after her present majesty, unless such conditions of government were previously framed as should secure from English influence the honour and independence, the religion, liberty, and trade of Scotland. Godolphin and the Whigs are said to have advised the queen to confirm this high-spirited act of the Scottish parliament, in order to alarm the English with the boldness of their designs, and thereby prepare them for an union which should give England an equivalent for their concession. When the threat of admitting a separate crown was once uttered by Scotland, an union was evidently necessary to quiet the mutual alarms of the two nations. The first important advantage which England gained in the previous treaty, was by the concession of the Scottish parliament, that the queen, or, in other words, the English ministry, should nominate the commissioners. These were chosen with an artful admixture of each party, that their concurrence in the union which was previously secured might abate the opposition of their friends in parliament. On the 16th of April 1706, the commissioners for both kingdoms met in the Cockpit, near Whitehall. The Scotch nation were not averse from a federal union, and their commissioners proposed it in place of an incorporating union, rather to gain credit with their countrymen than from any hopes that the proposal would succeed. On the 22d of July, however, the terms of an entire union were mutually signed, and next day presented to her majesty at St James's. By these it was agreed that the two kingdoms should for ever be subject to one crown and parliament; should enjoy the same privileges, and be subject to the same regulations in trade; and (with a few exceptions in favour of Scotland) to the same taxes, customs, and excise. An equivalent of 398,000*l.* was to be paid to Scotland, by England, for her customs and excise, so far as these were appropriated to the discharge of her national debt; but the loan was to be restored, with interest, in 15 years. Forty-five commoners and sixteen peers were to form the representation of Scotland in parliament. The same weights and measures were appointed, and the same seal for public transactions; the laws of Scotland, respecting public and private rights, were preserved, with this difference, that the former might be reduced to an uniformity through the united kingdom; but the latter were to receive no alteration, unless for the evident benefit of the subject. These terms were digested in 29 articles, for the consideration of each parliament; and the first of May 1707 was fixed for the commencement of the union.

The Scotch, though not averse from a federal union,

were, throughout all ranks, averse from an incorporation. When, on the opening of their parliament by the queen's commissioner the duke of Queensberry, the terms of the treaty were revealed, the nation passed from a deep and anxious suspense to an universal burst of indignation at the surrender of the independence and sovereignty of the ancient kingdom. Multitudes resorted from the country to the capital; the rage and numbers of the tumultuous people increased as they ranged the streets in quest of the commissioners, whom they accused of betraying their country; and nothing but concert and a leader were wanting to overturn the parliament, together with the union. In vain the privy council of Edinburgh issued a proclamation against riots, commanding all persons to retire at beat of drum. The duke of Queensberry, through double lines of horse and foot, was obliged to pass along the streets at full gallop, amidst the curses and reproaches of the people, who pelted his guards, even wounded some of his friends who attended him in his coach. Insurrections, in arms, were even projected in many parts of Scotland, which were only disappointed by the treachery of the leaders. So outrageous was the capital, so numerous the petitions from all parts, and so alarming the appearance of Scotland, that the commissioner and the chancellor wished to adjourn the parliament, till the ferment should subside; but Stair, Godolphin, and the other Whigs, who saw that delay would ruin the business, urged them to perseverance, and were determined to maintain it by force of arms, promising supplies of troops from England, Ireland, or even Flanders, if they should be required. The secret history of the intrigues and corruption that produced the union, has been lost, or industriously suppressed; but, it is certain, that above four-score members were dependents on the court, or influenced by honourable and lucrative places, or by the contingent payment of arrears and public debts. The Country Party was equally numerous; but the distribution of twenty thousand pounds, from the English treasury, among nineteen peers and eight commoners, chiefly of the party called the *Squadroné Volante*,* from their fluctuation between the Court and Country Party, determined a majority in favour of the union.

When the Scottish parliament proceeded to debate, every article of the treaty was made the subject of a protest. The Country Party maintained that the supposed benefits of commercial intercourse were a mockery, in return for the rights of independent legislation; and conjured their countrymen never to accept of a poor equivalent, and the right of trading to the English plantations, as a compensation for the free trade which they had hitherto enjoyed to the Levant, the Baltic, France, Spain, Portugal, Holland, and the Dutch plantations, a commerce which would now be fettered with restrictions, duties and customs. "Methinks I see a free and independent kingdom," said the patriotic lord Belhaven, "delivering up the great object of dispute among nations, for what the world has been ever fighting, and all Europe is now engaged in war,—the power to manage their own affairs, without assistance or controul. I see the present peers of Scotland, whose ancestors have exacted tribute through England, walking like English attorneys in the court of requests; while, at home, a petty English exciseman shall receive more homage and respect, than were ever paid to the greatest

of their progenitors. I see the estate of barons, the bold assertors of our liberties, in the worst of times, setting a watch upon their lips, and a guard upon their tongues, to avoid the penalties of unknown laws; and the burrows walking through their desolate streets, drooping under disappointments, and wormed out of the branches of their former trade. I see the honest and industrious tradesman, loaded with new taxes and impositions, disappointed of the equivalent, eating his saltless pottage, and drinking water instead of ale. I see the incurable difficulties of the landed gentry, fettered with the golden chain of equivalents, their daughters petitioning for want of husbands, and their sons for want of employment; but, above all, I see our ancient mother Caledonia, like Cæsar, sitting in the midst of our senate, looking mournfully around, covering herself with her royal garment, and breathing out her last words, '*And thou, too, my son,*' while she attends the fatal blow from our hands. Patrieide is worse than parricide; to offer violence to our country is worse than to our parents; but shall we, whose predecessors have founded and transmitted our monarchy entire, shall we be silent when our country is in danger, or betray what our progenitors have so dearly purchased. The English are a great and glorious nation. Their armies are every where victorious; their navy is the terror of Europe; their commerce encircles the globe, and their capital has become the emporium of the whole earth. But we are obscure, poor, and despised, though once a nation of better account, situate in a remote corner of the world, without alliances, and without a name. What then can prevent us from burying our animosities, and uniting cordially together, since our very existence as a nation is at stake? The enemy is already at our gates; Hannibal is within our gates. Hannibal is at the foot of the throne, which he will soon demolish; seize upon these regalia, and dismiss us never to return to this house again! Where are the Douglasses, the Grahames, and the Campbells, our peers and chieftains, who vindicated, by their swords, from the usurpations of the English Edwards, the independence of their country; which their sons are about to forfeit by a single vote. I see the English constitution remaining firm; the same houses of parliament, the same taxes, customs and excise, the same trading companies, laws, and judicatures; whilst ours are either subjected to new regulations, or annihilated for ever. And for what? that we may be admitted to the honour of paying their old and presenting a few witnesses to the new debts which they are pleased to contract. Good God, is this an entire surrender! My heart bursts with indignation and grief, at the triumph which the English will obtain to-day over a fierce and warlike nation, that has struggled to maintain its independence so long; but if England should offer us our conditions, never will I consent to the surrender of our sovereignty, without which, unless the contracting parties remain independent, there is no security different from his who stipulates for the preservation of his property when he becomes a slave." The eloquence of Belhaven and Fletcher were exerted in vain; the union was determined in the Scottish parliament, by a majority of 33 votes.

The articles of union were approved of in the English parliament by a large majority, in spite of the opposition of the Tories. Addresses and rejoicings fol-

* The leaders of the *Squadroné*, among the Peers, were Marchmont, Montrose, Roxburgh, and Tweedale.

lowed it in England, but a sullen and inflexible silence was observed in Scotland; and instead of the union, the Pretender's birth-day was publicly celebrated. An influx of English revenue officers overspread the country, which, till then, had been unacquainted with the oppressive laws of revenue. Whatever were the merits of the union, it would have left Scotland in a worse situation than before, if the Scottish privy council had not been abolished; a body which, acting without the restraint of a native parliament, would have soon degenerated into the tyranny of former reigns. From the same enlightened views which produced the union, the abrogation of this body was concerted by Lord Somers and the principal Whigs, and was accomplished by a bill which passed both houses in the succeeding year, for "*rendering the union more entire and complete.*"

Meanwhile the importunities of the Jacobites, and the indignation of Scotland, had roused the attention of the French court. A naval expedition was prepared at Dunkirk, but its destination was prematurely discovered by the Pretender's arrival. The French squadron, however, reached the Scottish coast, and was only prevented by overshooting the Forth in the dark, from landing the Pretender with 5,000 regular troops at a time when there were not half that number of British forces in Scotland; when the fortresses were in doubtful hands; and when the equivalent was in Edinburgh castle, then unprovided for defence. The northern nobility, Gordon, Athol, Errol, Panmure, and others, had engaged to take arms; but the French retired on desecrating the English fleet, and the prisons were immediately crowded with suspected persons. Among these, were Belhaven and Fletcher, who were conveyed to London; and the prostrate nation was unnecessarily insulted with the spectacle of its nobility, its gentry, and its patriots, led in ostentatious triumph to the English capital. Belhaven did not long survive his country's and his own disgrace, but died soon after his release of grief and indignation. A few who were remanded for trial to Scotland were acquitted by the judiciary court, in consequence of a list of witnesses having been refused to them; an acquittal which disappointed and enraged the English ministry, and occasioned their obtaining a bill in the succeeding parliament, for extending the English treason laws to Scotland.

The triumphs of the Whigs were carried still higher after the union by the successes of the allies in Germany. In 1708, the allied and French armies met at Oudenarde, on the Scheldt, where the latter were defeated with immense loss; and Lisle, Ghent, Bruges, and the other strongest towns of Flanders, fell into the hands of the victors. The campaign secured the Dutch frontier, and left France open to invasion.

The French monarch, long persecuted by fortune, and every hour fearing for his capital, once more petitioned for peace. The Tories, some from a partiality to France, and others from conceiving the war unnecessary for national advantage, were desirous to put an end to it; but when conferences were at length begun at Gertruydenberg, they were conducted under the influence of Marlborough, Eugene, and Linzendorf, all three entirely averse to the treaty. The French ministers were subjected to every species of mortification, their conduct narrowly watched, their master insulted, their letters opened. They offered the utmost concessions to abandon Philip, and even to aid in dethroning him, and to grant the Dutch a large barrier; but the confer-

ence was broken off, and Louis resolved to hazard another campaign.

The first attempt of the allies in the campaign of 1710, was on the city of Tournay, strong by art and nature, and garrisoned by 12,000 men, which surrendered after a dreadful siege of 21 days. They concluded the campaign by taking possession of Mons after the battle of Malplaquet, in which the French, 120,000 strong, were posted behind the woods of La Merte and Tanieres, in a camp that seemed impregnable with triple entrenchments. On the 11th of September, Marlborough led the allies to storm this position, and drove the French at last from it after a dreadful carnage, in which the allies lost not less than twenty thousand men.

But in spite of splendid victories, the influence of Marlborough and the Whigs was declining. The influence of the duchess of Marlborough, which had long been almost despotic over the queen, was supplanted by another favourite, Mrs Masham, whom the duchess herself had raised to favour. Mr Hill, the brother of the new favourite, being appointed by the queen to the command of a regiment, the duke of Marlborough sent a letter to the queen, desiring she would permit him to retire from his employments. This was the conjuncture for which the Tories had long wished, and with which the queen herself was secretly pleased; and she was exhorted by the Tories to set herself free from an arbitrary party, by which she had been long kept in dependence. The earl of Godolphin, the duke's son-in-law, was divested of his office, and the treasury was submitted to Harley. Lord Somers was dismissed from being president of the council, and the earl of Rochester appointed in his room: not a Whig was left in office, except Marlborough himself, who retained his employments for some time, the object of envy and reproach.

The last campaign, however, of this great commander, exceeded, if possible, his other exploits. Villars, the French commander, had prepared for the campaign of 1711, by fortifying his lines from Bouchain, on the Scheldt, along the Sanset and the Scarpe, so strongly, that he pronounced them impregnable, and called them the *ne plus ultra* of Marlborough. Marlborough, however, crossed them without the loss of a man, by making a dextrous feint of attacking them in one quarter, and suddenly marching to surprise them in another. After taking possession of the enemy's lines, he besieged Bouchain, and obliged the garrison to surrender prisoners of war. This was Marlborough's last exploit: He had never fought a battle which he did not win, nor laid siege to a place which he did not take. By his final campaign, he left the allies in possession of the Maese almost as far as the Sambre, of the Scheldt from Tournay, and of the Lys as far as it is navigable. They had reduced Spanish Guelderland, Limbourg, Brabant, Flanders, and the greatest part of Hainault, and had opened a way into the very heart of France. The duke returned to England, after humbling her proudest enemy, to receive in his own person every indignity that party-spirit and ingratitude could attach to him. He was accused of having taken a bribe from a Jew, who contracted to furnish the army with bread; and with having appropriated 2½ per cent. from the pay of the foreign troops. The present from the Jew was a customary perquisite, and the per centage had been granted by an express warrant from the queen. The money had been expended in procuring private intelligence for the army; and

the value of the intelligence which the duke had always procured, may be best estimated by his successes. He was, however, dismissed from his employments.

On his removal, the command of the English army on the continent was given to the duke of Ormond, who had private orders not to act with vigour against the enemy: a caution scarcely necessary to a general, who was every way unqualified to follow up the career of Marlborough; and which leaves us at a loss, whether most to admire the meanness or the inconsistency of a cabinet, who durst not at once conclude a peace till they had made the war disgraceful. The defection of the British troops was severely felt by the allied troops, who soon suffered a severe check at Denain. Prince Eugene was unable, alone, to resist the progress of Villars and Douay. Quesnoy and Bouchain were recovered by the French in this disastrous campaign. The immediate and rapid successes of France, after Marlborough's removal, furnishes the best arguments for condemning that false pity towards Louis, which the Tories of that period so deeply cherished, and the relaxation of that hostility against France, which, if kept up at the beginning of the century, might have saved Europe from subjugation before the end of it.

In the mean time, conferences for peace had been opened at London, and the earl of Strafford had gone as ambassador to Holland for the same purpose. Neither the influence of the Whigs at home, nor the merit of prince Eugene, who came to London in order to excite the public spirit against the negotiations, could intercept, or even retard them. The treaty began at Utrecht, and a peace was concluded in 1713, between France and Britain. By this peace it was stipulated, that Philip, who had been settled on the throne of Spain, should renounce all right to the crown of France; that the duke of Berry, his brother, the presumptive heir to the crown of France after the death of the Dauphin, should also renounce his right to the crown of Spain, in case he became king of France. The duke of Orleans was to make the same resignation. The duke of Savoy had the island of Sicily, with the title of king, with Fenestrelles, and other places on the continent. The Dutch had that barrier granted them which they had so long sought for; but if the house of Bourbon was stript of some dominions, in order to enrich the duke of Savoy, on the other hand, the house of Austria was taxed to supply the wants of the Hollanders, who were put in possession of the strongest towns in Flanders. In behalf of England, it was agreed that the fortifications of Dunkirk should be demolished, and its port destroyed. Spain surrendered Gibraltar and the island of Minorca. France resigned Hudson's Bay, Nova Scotia, and Newfoundland, but was left in possession of Cape Breton. Among the articles which reflected honour on the English, the liberation of French Protestants, confined for their religion, was not the least important. To the emperor, the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands, were assigned. Prussia was allowed Upper Guelder; and a time was fixed for the emperor's acceding to these resolutions, for he had hitherto refused to assist at the treaty.

The union with Scotland at first gave so little satisfaction, that, before six years had elapsed, the same party by whom it was established proposed to dissolve it, from the real or imaginary injuries which the nation

had sustained. On a day appointed to consider the state of the nation, the earl of Seaford enumerated the grievances which the Scotch had endured: the introduction of English laws against treason; the declaration of their peers being incapable of acquiring honours; and the oppression of a tax,* which the country could not sustain. He was seconded by Mar, Argyle, and the Scottish peers. The English Tories, however, concurred in preserving an union which they had formerly so much opposed. The English Whigs, apprehensive of an obscure design which the queen was said to entertain, of introducing her brother, the Pretender, into Scotland, and securing his succession to the crown, listened to the assurances of the Scotch, that they would support the Protestant succession if the union were dissolved, warmly supported the proposal. So nearly were the parties balanced, that the motion was rejected by only four votes.

During the remainder of Anne's reign, the Tories retained their power, with a security which was only disturbed by their own quarrels. The cabinet was a scene of the bitterest altercations between the followers of Bolingbroke and of Oxford. The former, daring, proud, and impetuous, carried the designs and zeal of the Tory party to the utmost pitch; the other was for a reconciliation with the Whigs, whose resentment he feared, as the queen's health began visibly to decline. Bolingbroke prevailed. Oxford was removed from the treasury, while the suddenness of his fall occasioned the utmost confusion at court. The fatigue of attending a long cabinet council had such an effect upon the queen's spirits and constitution, that she declared she could not outlive it, and was immediately seized with a lethargic disorder. On the 30th of July, when her life was despaired of, the committee of the council, assembled at the cock-pit, adjourned to Kensington; being informed of the desperate situation in which she lay, repaired to the palace, and, without being summoned, entered the council chamber. By their advice, all privy counsellors in or about London were invited to attend, without distinction of party. Somers, and many others of the Whigs, immediately repaired to Kensington. By their measures, the designs of Bolingbroke, and those who favoured the Jacobite succession, were defeated. Troops were ordered to London; the heralds-at-arms were kept in waiting; and precautions were taken to secure the sea ports, and to overawe the Jacobites in Scotland. The queen continued to dose in a lethargic insensibility till the first of August, in the morning, when she expired, in the 50th year of her age, and in the 13th of her reign; and with her ended the race of Stuarts. See ANNE.

George I. son of Ernest Augustus, elector of Brunswick, and Sophia, grand-daughter to James I. succeeded, pursuant to the act of succession, in his 55th year. In the new parliament, which was summoned, the Whigs had by far the majority; full of the strongest aversion to the Tories, and led on by the king himself, who made no secret of his displeasure at the party who were accused of having intended to exclude him from the throne. The commons began the expression of their resentment by arraigning lord Bolingbroke for high treason; but that intriguing statesman disappointed their vengeance by flying to the continent, from whence he solemnly declared his having cherished no favour for the Jacobites, though he afterwards embark-

* A tax upon barley, which, from the inferiority of the Scotch barley, was unequal, and distressing.

ed in the Pretender's interest. Robert earl of Oxford was impeached for the same crime, and was committed to the Tower, where he remained for two years. When he was brought to trial, a dispute arose among the commons, who were to be summoned to impeach him, which prevented their appearance; and he was discharged for want of accusers. While these severities were attempted against an humiliated faction, some popular disturbances, which, though transient and easily suppressed, gave alarm to a timid and jealous government, drew forth a most tyrannical edict against rioting, which made it unlawful for even a group of people to assemble on the streets. In this system of proscription, exclusion, and jealousy, the Whigs were only imitating the recent conduct of their adversaries, but they improved upon the example; they converted the Tories into Jacobites, and filled the nation with tumult and discontent. The earl of Mar, the secretary of state for Scotland, professed an early allegiance to George, and procured a loyal address from the Highland clans; but the contumelious refusal of his overtures, and the fate of Oxford, Strafford, Ormond, and Bolingbroke, drove him to despair.

On repairing to the Highlands, he was joined by 10,000 men from clans or families disgusted at the union, or attached to the hereditary descent of the crown. With these he made himself master of Fife. The Duke of Argyle, who commanded the troops in Scotland, set out from Stirling to oppose him; and at Dumblane determined to give him battle, though his forces did not exceed 3,500 men. The rebels having attempted to surround his diminutive army before he could change his position, their centre charged his left wing, and were once repulsed; but Glengary, one of their chiefs, waving his bonnet, and crying out, "Revenge!" they made a second charge, with such success, that General Witham fled to Stirling, and gave out that all was lost. Argyle, however, had, in the mean time, attacked with the right wing, and driven the opposing wing of the rebels across the Allen; when he returned to that part of the rebels which had been victorious. Neither army chose to renew the attack, but drew off, each claiming the victory. It was sufficient for Argyle to have interrupted the enemy's progress, since to them delay was defeat. Mar was soon deserted by numbers of his irregular followers; and the castle of Inverness being delivered up by Lord Lovat, who betrayed his trust, the cause of the pretender became desperate in the north. Nor was it more successful in England. The Earl of Derwentwater and Mr Forster took the field on the borders of Scotland, and penetrated as far as Preston, where their army was invested on all sides by the regular forces under General Wells. They at first repulsed the attack of the royal army; but before the assault was renewed, surrendered at discretion, after having in vain attempted to obtain terms of capitulation. Their leaders were brought to London, and led through the streets pinioned and bound; while the common men were confined in Chester and Liverpool. This desperate state of his affairs, did not hinder James from hazarding his person among his friends in Scotland. Upon his arrival at Aberdeen, with six gentlemen in his retinue, he was

solemnly proclaimed; and soon after made a public entry into Dundee.

After ordering thanksgivings in the churches for his safe arrival, he abandoned the enterprise with the same levity with which it had been undertaken; and he embarked for France, with the Earl of Mar and other adherents. The rebellion was thus suppressed, but the fury of the law was let loose in all its terrors on the devoted prisoners. An act of parliament, contrary to the custom of the constitution, was made for trying many of them, not in Lancashire, where they were found in arms, but in London; and the habeas corpus act was suspended. The Earls of Derwentwater, Nithsdale, and Kenmuir, were sentenced to death; Nithsdale, however, escaped in Woman's clothes, which were brought to him the night before the execution.

Though the rebellion was thus extinguished, the danger of the state was made a pretext for continuing the parliament, and repealing the act by which they were to be dissolved at the expiration of every third year; an outrage on the constitution at which the people might murmur, but of which they could obtain no redress.

Domestic concerns being thus adjusted, and the prospect of a dangerous enemy abroad having been also dispelled by the death of Charles the XIIth, at the siege of Frederickstadt, his majesty paid a visit to his German territories, and entered into several alliances with the different powers of Europe; among which the most remarkable was the quadruple alliance. It was agreed between the Emperor, France, England, and Holland, that the Emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the Duke of Savoy; that the succession for the duchies of Tuscany, Parma, and Placentia, should be settled on the Queen of Spain's eldest son, in case the present possessors should die without issue. This treaty was generally thought unfavourable to the interests of England, as it interrupted the commerce with Spain, and destroyed the balance of power in Italy, by throwing too much into the hands of the Emperor. England, however, fitted out a strong squadron, in order to bring Spain to terms; and as her mediation was refused, it was resolved to support the negotiations by force. Sir George Byng, sailing to Naples with 22 ships of the line, delivered that place from the terrors of a Spanish invasion; but learning that the Spanish fleet had landed 30,000 men in Sicily, he returned westward, and after doubling Cape Faro, came up with 27 sail of the line. The hostile fleet, though so much superior, maintained only a running fight, in which they lost 3 of their ships. This blow produced a remonstrance on the part of Spain, which France and England answered by declaring war against her; but the failure of an enterprise for landing the Pretender, concerted by the Duke of Ormond, and the Spanish minister Alberoni, occasioned by the dispersion of the armament by a storm, off Cape Finisterre,* together with the bad success of the Spanish army in Sicily, in a short time obliged the Spaniards to sign the quadruple alliance.

One of the most important domestic events of this reign, was an act, which the English parliament passed,

* Two frigates, however, arrived in Scotland, with the Earls Marischal and Seaforth, the Marquis of Tullibardine, and 300 Spaniards. They were joined by some Highlanders; but on the attack of some regular troops from Inverness, the Highlanders dispersed, the Spaniards threw down their arms, and the rebel leaders escaped to the continent.

to secure the dependency of that of Ireland. The barons of the exchequer in Ireland, having, by order of the British peers, put a Mr. Maurice Annesly in possession of certain lands, in a litigation concerning which, he had appealed from the Irish to the British parliament, a dispute succeeded, which was terminated by a bill passing the English legislature, depriving the Irish lords of the power of final jurisdiction. About this period, the public suffered severely from one of the most ruinous impostures that ever duped its credulity. Ever since the revolution, government had been accustomed to borrow from mercantile bodies, and among the rest from the South Sea Company. Sir Robert Walpole having conceived a design of lessening the interest paid to those companies from 6 to 5 per cent., the several companies agreed to receive it; and the South Sea Company accordingly, to whom the government owed 10 millions, were satisfied to lend it for 500,000*l.* a year. While the public was reaping this obvious advantage, Sir John Blount, a man who had been born a scrivener, proposed, in the name of the South Sea Company, to lessen the national burthen still further, by permitting the South Sea Company to buy up the debts of the other companies. The South Sea Company was to redeem the debts of the nation out of the hands of the private proprietors, who were creditors to the government, on whatever terms they could make; and for the interest of this money, which they had thus redeemed and taken into their own hands, they would be contented to be allowed, for 6 years, 5 per cent., and then the interest should be reduced to 4 per cent., and be redeemable by parliament. For these purposes, a bill passed both houses, and, as the directors of the South Sea Company could not of themselves alone be supposed to be possessed of money sufficient to buy up these debts of the government, they were empowered to raise it by opening a subscription, and granting annuities to such proprietors as should think proper to exchange their security, namely, the crown for the South Sea Company. The bait held out to adopt the latter security, was the chimerical prospect of having their money turned to great advantage, by a commerce to South America, where it was pretended, that settlements were to be granted to the English by Spain. The directors' subscription books were immediately crowded; the delusion spread, and the subscriptions soon sold at a prodigious increase of price. But the multitude, who had paid so dear for a stock of visionary value, soon awoke from their dreams of opulence, and thousands found themselves involved in ruin. Parliament, however, was determined, as far as they could, to strip the directors of their ill gotten gains. All directors of the company were removed from their seats in the House of Commons, or offices of state; and after punishing the delinquents, the legislature allotted, out of the profits of the South Sea scheme, seven millions to the ancient proprietors, while the remaining capital stock was divided among all the proprietors at the rate of 3*l.* per cent.

Few transactions of much importance occurred during the remainder of this reign. The king, who had emissaries at every court, and a friend in every potentate, was informed by the regent of France, of a new conspiracy, which was formed against him by many characters of power and influence in the nation. The plan, however, of the conspiracy was not divulged to the public. Christopher Layer, a young templar, was the

only individual who suffered death: he was convicted of enlisting men for the Pretender. The Duke of Norfolk, the Lords Orrery, North, and Grey, were imprisoned on suspicion, but Bishop Atterbury alone was brought to punishment. He was sent into exile, upon the evidence of intercepted letters in cipher, by a sentence of very questionable justice.

A new war with Spain commenced in 1726, in consequence of the jealousy which the king entertained of the treaty which Spain and the emperor had recently contracted. The apologists for the war pretended, that the balance of Europe was in danger from the coalition of those potentates, and that secret articles had been agreed upon between them for aiding the Pretender, and for wresting Gibraltar from the power of Britain.

But Spain and the emperor loudly denied that their alliance was offensive, and many in the nation believed that a German prince had brought his native prepossessions to the British throne, and that, whatever pretences were made of the balance of Europe being in danger, the war was commenced for the interests of Hanover alone. By the treaty of Hanover, which was framed to counteract the designs of Spain and the emperor, France, Sweden, Denmark, and Prussia, became the allies of Britain. Catharine of Russia, on the other hand, menaced the smaller northern powers, and an English fleet was sent to overawe her in the Baltic. Admiral Hozier was sent to South America to intercept the Spanish galleons, and continued cruising in those seas till his men perished by the unhealthiness of the climate, and his ships were totally ruined by worms. But the Spaniards, who had intelligence of his approach, carried back their treasures to Panama. In a short time, France offered her mediation, and a temporary, though insincere, reconciliation was produced.

In 1727, the king resolved to visit his electoral dominions. Having appointed an administration in his absence, he embarked for Holland, and lay, upon his landing, at the little town of Vòet. Two days after he arrived at Delden, apparently in perfect health. But on the morning of the next day, he was suddenly seized with a paralytic stroke, lost the faculty of speech, and was conveyed in a state of lethargic insensibility to Osnabruck. There he expired on the 11th of June, in the 68th year of age, and the 13th of his reign. George I. was plain and simple in his person and address, though familiar, and even facetious in his hours of relaxation. Endowed with courage and fortitude, considerable prudence, and still more assiduity, he had acquired, before he ascended the throne of Britain, the character of an able politician, a merciful prince, and a circumspect general. If he deviated, in his reign, from the principles of the constitution, it has been generally agreed that it was chiefly because a venal ministry misled him; yet the blame of his sacrificing the peace of England to his quarrels as Elector of Hanover, appears by no means entirely transferable to his minister.

George II. succeeded to his father in the 44th year of his age. His abilities were weaker, but his prejudices, especially his continental partialities, were stronger than those of the late king. The various subsidies of the last reign, which had already swelled the national debt to the amount of fifty-two millions, and the foreign connections which occasioned that expence, were still continued. The ministerial power was still divided among a party who had long maintained an

ascendency. Lord Townsend conducted foreign negotiations. The duke of Newcastle was of consequence, from his influence in parliament, though without eloquence or intellectual merit. Lord Chesterfield, with brilliant powers, was contented to act subordinately to men of inferior genius to himself. Sir Robert Walpole was at the head of the treasury. He possessed a species of eloquence, dispassionate, plausible, and easy, though neither elegant nor nervous. He was well acquainted with finance; had been regarded as a martyr to his party under the influence of the Tories; and a dangerous rival of Sunderland himself. He headed that party which was called the court party, (for the distinction of Whigs and Tories was not now entirely applicable to the factions of the state.) Their favourite measures were, forming foreign alliances; the subsidizing foreign troops; and alarming the country and House of Commons with the supposed dangers of the state. The country party, on the contrary, deprecated foreign connections, and the maintenance of large armies, as dangerous to public liberty at home, and expensive when subsidized abroad. The leaders of this party were Sir William Wyndham, an energetic speaker; Mr Shippen, calm, intrepid, shrewd, and sarcastic; Mr Hungerford, who was insinuating and ironical; and Mr Pitt, who was now rising into eminence, for the fiery vehemence of his genius, and the extent of his knowledge. It required all the phlegmatic fortitude of Walpole to stand the united attacks of these orators. Secure, indeed, in the system of corruption which he had matured in the House of Commons, he was always sure of majorities, but he was frequently baffled in argument by those whom he beat by means of numbers.

The principal subjects of these disputes, during the first pacific years of George II. were the settlement of the civil list;* the mutiny bill; the pension list; the number of the standing army, which Mr Pulteney and the patriotic party wished to be reduced to 12,000; the subsidies to the German princes; and the treaties which were concluded with foreign powers. Of these, the most important were the treaties of Seville and Vienna. Their professed object was to confirm the quadruple alliance; but a particular stipulation was added, for the succession of the Infant of Spain, Don Carlos, to the duchies of Tuscany, Parma, and Placentia. That prince was accordingly, upon the death of the Duke of Parma, by the assistance of an English fleet, put in peaceable possession of Parma and Placentia; and 6000 Spaniards were quartered in the duchy of Tuscany, to secure him the reversion of that kingdom.

The success of the ministry, in obtaining taxes and supplies, was interrupted, in one instance, not by parliament, but by the people themselves. To prevent the frauds practised by the factors in London, who were employed by the American planters in selling their tobacco, Walpole proposed, instead of levying the customs in the usual manner upon tobacco, that what was imported should be lodged in warehouses appointed for that purpose by the officers of the crown, and thence be sold, after paying the duty of fourpence per pound, when the proprietor found a market for it. The proposal raised such a ferment in London, that the avenues to the house of parliament were choaked with enraged multitudes, and the minister began to be in fear of his life. The proposal was carried in the house; but the

ministry thought proper to appease the public by dropping the scheme; and the triumph was celebrated with public rejoicings.

The success of the opposition on this occasion, induced them to attempt a repeal of the septennial, and to restore triennial parliaments: but in this, as in other efforts, they were outnumbered; and, in despair of being able to stem the torrent of corruption, they retired to their seats in the country, leaving the minister and his corrupted followers an undisputed majority in the commons.

The minister being now left, for a while, without an opposition, took an opportunity to render his rivals odious or contemptible, by getting several useful laws passed in their absence; but a fresh opposition soon sprung up, and it was increased by the partizans of the Prince of Wales: a prince that was the darling of the people, and the enemy of a venal ministry. He had lately married the Princess of Saxe-Gotha. During the confinement of the princess in childbed, a message from the king produced a misunderstanding, which at last occasioned his royal highness being forbidden the court. A motion which was made by the prince's friends, to increase his settlement from 50,000*l.* to 100,000*l.*, was rejected in the commons through the influence of Walpole, although it was proved, that, according to his majesty's own regulation, his establishment required 63,000*l.* per annum.

At a certain period of civilization and information, the press comes to possess, among a free people, a power equal or superior to any constituted authority. This formidable organ of public sentiments, Walpole had severely felt; but he had successfully used the art of bribery, to attach the herd of ephemeral political writers to his cause: but the theatre, however, threatened to add ridicule to public scrutiny. To silence these, he brought in a bill to limit the number of playhouses, and to subject all dramatic writings, before their appearance, to the inspection of the lord chamberlain. Among the opposers of the bill, the earl of Chesterfield spoke with becoming zeal in behalf of literary liberty. "If stage-players (said his lordship) exceed the bounds of propriety, they may be punished. To rob a man of the fruits of his wit, is to rob him of his property; and as wit is too often the sole property of its possessor, the injustice becomes a cruelty. If poets and players are to be restrained, let them be tried by their peers, not by a lord chamberlain. A power lodged in his hands to judge, without appeal, is a power unknown to the constitution."

The public attention was, however, soon called from domestic to foreign disputes. The unexplained rights of the English to cut logwood in the bay of Campeachy, and the attempts of the individual traders to drive an illicit trade with the Spanish main, had drawn indiscriminate retaliations and injuries from the *guarda costas* of that nation, who plundered the English merchants, and sent the subjects of Britain to be buried in the mines of Potosi. Remonstrances had already been made to no purpose; but the clamours of the merchants were at last listened to by parliament; and a convention between the two crowns was concluded at Prado, importing, that plenipotentiaries should meet at Madrid to regulate the subjects in dispute. Spain was to pay a sum of money, on condition of her claims on Britain

* The civil list was fixed at 800,000*l.*: its arrears were afterwards made up by considerable sums that were voted.

being satisfied; and both sides were to discontinue hostile preparations. But the minister, in demanding the first supply from parliament, was obliged to acknowledge, that the sum stipulated by Spain had not been paid; and, to appease the public now, he began to prepare for war. The French declared themselves bound by treaties to assist Spain: the Dutch declared a neutrality.

Never was war commenced so entirely with the wishes of the nation, and the supplies were granted in parliament without debate. Admiral Vernon sailed to the coast of South America, and, with only six ships, destroyed all the fortifications of Porto Bello, and came away with scarcely the loss of a man. Commodore Anson was to have co-operated with Vernon across the isthmus of Darien, but was detained by the blunders of the ministry; and, coming into the South Seas at the stormy season, his fleet was dispersed, and his crew miserably reduced by the scurvy. He refreshed his men, however, at the delightful island of Juan Fernandez; after which, he sailed along the coast of Chili, and destroyed the rich city of Paita. Traversing next the great Pacific Ocean, his crew were again visited by the dreadful disorder of the sea scurvy. One of his ships becoming leaky, and the number of his hands decreasing, he set her on fire in the middle of the ocean. His fleet being now reduced to one ship, the *Centurion*, and all the crew in the most deplorable condition, he cast anchor on the deserted island of Tinian, which lies about half way between the American and the Asiatic continents. This island had some years before been peopled by near 30,000 inhabitants; but an epidemical distemper coming among them, destroyed a part, and the rest forsook the place. Nothing, however, could exceed the beauty of the spot. The most romantic imagination cannot form a scene surpassing what Tinian naturally afforded,—green fields, groves, cascades, flowers, and prospects. All that a sea-beaten company of mariners could wish was found in abundance,—clear and wholesome water, medicinal herbs, domestic animals, and other necessities for refitting their shattered vessels. From thence he proceeded to China, and, returning the same way, fell in with the long-expected prize of a Spanish galleon from the Philippine islands, valued at 313,000*l.*; which, with other captures, he brought to England, after finishing a voyage of three years, profitable to himself and his crew; and though not immediately conducive to the good or glory of the nation, yet indirectly compensating for the loss of a fine squadron, by the sea-faring experience which he left recorded.

The armament to which Anson was to have acted subordinately was very unfortunate. It consisted of 29 ships of the line, nearly as many frigates, and of 15,000 soldiers. They arrived before Carthagena, and mastered the strong forts which defended the harbour, but were obliged to use the escalade in attempting those which lay nearer the town. But the guides being unfortunately slain, the forces attempted the strongest places of the forts; their scaling ladders were too short; and they retreated at last, leaving 600 dead behind them. The rainy and sickly season set in soon after this fatal attempt; and the commanders disagreeing among themselves, and unable to retrieve the calamity, re-embarked the troops, and returned.

The discontent which this fatal miscarriage occasioned, fell principally upon the minister; and the activity

of the enemy, who took hundreds of merchantmen, while our fleets made but few reprisals, increased the murmurs of the people. In the succeeding parliament, the elections went in favour of the Country Party; and Walpole, after a vain endeavour to gain over the Prince of Wales and his friends to his support, by making him pecuniary offers, beheld his strength expire in the House of Commons, and resigned all his employments. He was succeeded as minister by Lord Carteret. The people rejoiced universally at his fall, expecting from his successor a redress of grievances at home, and a vigorous conduct of the war abroad; but the war continued for some years with indifferent success. Some unsuccessful expeditions were carried on under Admiral Vernon and Commodore Knowles; the issue of these, and the general failure of a naval war, inspired the nation with impatience, to try their fortune and their energies on the other element. The king's attachment to his electoral dominions concurred with this desire; and, as an army was prepared for Flanders, the Spanish war became but a secondary object.

The troubles of Europe were now breaking out afresh, from the disputed succession which succeeded the death of Augustus, king of Poland. Germany and Russia supported the Elector of Saxony, son of the deceased king. France declared for Stanislaus, whom Charles the XII. of Sweden had long ago nominated; and attacked Austria with an army commanded by the aged Marshal Villars, who had now no Marlborough to oppose him. The duke of Montemar, the Spanish general, was equally victorious in the kingdom of Naples; and the emperor, Charles the VI. had the mortification of seeing himself deprived of the greatest part of Italy, for having attempted to give a king to Poland. These rapid successes of France compelled him to a peace, and the Elector of Saxony was obliged to renounce all right to the crown of Poland. In 1740, the death of the emperor left his daughter beset by enemies, who would have stript her of her dominions; and who, in defiance of the Pragmatic sanction, which settled her father's crown upon her, caused the Elector of Bavaria to be crowned emperor. Britain, Sardinia, and Holland, became her allies in this forlorn situation: a subsidy of 300,000*l.* was granted to her by parliament in 1741, and a subsidy of 500,000*l.* in 1742; and in a short time she triumphed over all her enemies. But whatever sympathy the queen of Hungary's cause might excite in Britain, there were few but the followers of the court who commended the lavishing of British blood and treasure in a cause which only concerned the Elector of Hanover. When the supplies came to be considered in parliament, after information from his majesty, that the British forces in the low countries had been augmented with 16,000 Hanoverians, Lord Chesterfield observed, that the nation, after having exalted the Elector of Hanover from a state of obscurity to the crown, was condemned to hire the troops of that electorate to fight their own battles; to hire them at a rate which was never demanded before; and to pay levymoney for them, though it was known to all Europe that they were not raised for the present occasion. But the new ministry of Lord Carteret were proof against the force and truth of such remarks, for they were supported by the ex-ministry of Walpole, in return for being screened from the indignation of the public by their successors, the apostates of patriotism.

In less than three years, the Queen of Hungary's

affairs wore a prosperous aspect : The French were driven out of Bohemia, Prince Charles of Lorraine defeated the Bavarians at Brannau, and the Croats penetrated the Tyrol to the gates of Munich. Her rival, the nominal emperor, fled to Franckfort, and agreed to continue neutral during the war, which the French had begun as allies, but now supported as principals. Lord Stair, who commanded the British army, sent to the Queen of Hungary's aid, being anxious to join Prince Charles of Lorraine, pushed forward towards the Mayne; while the French under Marshal Noailles, 60,000 strong, possessed the eastern side of the river; and by their movements, threatened to cut off all the supplies of the English army. The King of England arriving at this critical period, marched on his troops in order to join some German succours at Hanau; but the French enclosed him as he advanced, at the village of Dettingen, in such a manner that he could not remain without starving, nor fight without disadvantage. The impetuosity of the French extricated our troops from a most dangerous situation; they passed a defile which they should have guarded, gave battle to the British, and were repulsed across the Mayne with the loss of 5000 men. The British monarch atoned for the want of prudence, which had brought his army into a snare, by a signal display of personal spirit and gallantry. The conquerors, however, were obliged to leave their wounded to the care of the enemy, their situation being still too hazardous to be maintained even after a victory.

On the Rhine, and in Italy, the French were more successful; nor did the enterprising and turbulent minister, Tencin, who now headed their councils, despair of replacing the Pretender on the British throne. Preparations were made at Dunkirk for embarking 15,000 troops. The duke de Rocquefueille, with 20 ships of the line, was to cover their descent, and count Saxe was to command them; but the appearance of sir John Norris, with a superior fleet, disconcerted the whole plan; on which the French thought proper to declare war. After this disappointment, the combined fleets of France and Spain ventured out of the harbour of Toulon, and were attacked by the British, who were superior in strength and numbers; but the battle was desultory and indecisive, owing to the mutual animosity of the British admirals: Matthews rushed precipitately into the engagement with his division, but was not seconded by Lestock. On the third day, after a confused combat, Lestock pursued the enemy, but was not seconded by the other admiral. Matthews, however, who, notwithstanding this failure, had alone fought with gallantry, was tried, and dismissed the service, while Lestock was acquitted, who had been principally to blame.

In the campaign of 1744, the French army in the Netherlands under count Saxe amounted to 120,000; while the English, Hanoverian, Dutch, and Austrian allies, hardly mustering above 70,000, could not prevent them from taking Friburgh, and in being in a situation early in the next campaign for investing Tournay. Inferior as the allies were, the duke of Cumberland led them on to attack the French, who held an eminence behind the town of Fontenoy. At two in the morning, the assailants moved on; about nine the British infantry bore down upon the enemy's line, who formed an avenue to receive them, and their artillery continued to perforate this forlorn body till about three in the afternoon, when they were obliged to retreat. The allies lost 12,000 men; but though the French lost nearly an equal num-

ber, they fixed their superiority during that campaign, as well as during the remainder of the war. The capture of Tournay was the first fruits of their victory; and, though the Elector of Bavaria, whom they had proclaimed emperor, was now dead, they were too much elated to remit hostilities against the allies.

Amidst the alarming prospect of a foreign invasion, the king's councils were committed to a ministry composed of more popular characters: lord Carteret, now created earl Granville, avoided impending danger and disgrace, by a voluntary resignation. The earl of Harrington succeeded him as secretary of state; the duke of Bedford was appointed first lord of the admiralty; the earl of Chesterfield, lord-lieutenant of Ireland; and Mr Lyttleton was made a commissioner of the treasury. About the same time a quadruple alliance was signed at Warsaw between the queen of Hungary, Britain, Holland, and Poland; and his Polish majesty was subsidised by Britain and the States General with 150,000*l.* a-year. To balance the bad success which had attended our continental operations, the admirals Rowley and Warren retrieved the honour of the British flag, and several rich prizes were captured at sea. The fortress of Louisbourg, in Cape Breton, in North America, surrendered to general Pepperell.

At this critical period of the war, the son of the Pretender resolved to make an effort at recovering the British throne. Since the projected invasion of count Saxe had miscarried, Charles had lived privately at Graveline, under the name of the Chevalier Douglas; but the report of the immense havoc at Fontenoy, and the belief that Britain had but a handful of regular troops at home, gave hopes to his ambition, and drew him from his retreat. The French court knew of his design, but they supported it only feebly and indirectly. By the help of two French merchants, of Irish extraction, whose names were Walsh and Rutledge, he obtained a man of war of 60 guns, and a frigate of 16, and some money and arms. Lord Clare, an emigrant Jacobite, raised 100 marines. With these he embarked from Nantz for Scotland, accompanied by a few friends, and with muskets for 2000 men, five or six hundred broad swords, and about 4000*l.* in money, his only means for reducing a great empire. In his course towards the Hebrides, an English man of war engaged his largest ship and disabled her. Charles, however, pursued his way to the Hebrides, in his small vessel, the Doutelle, and put ashore at Erisca, a small island in the western Highlands. From thence he proceeded to Boradale, a situation the most inaccessible in the Hebrides, and surrounded by those chiefs who, in former times, had fought the battles of the Stuarts. The first chief that came to him, at Boradale, was Cameron of Lochiel, the son of the elder Lochiel, to whom the Pretender had entrusted his principal confidence in Scotland. Lochiel, though distinguished by his hereditary energy of character, was too wise not to foresee the consequences of so desperate an enterprise, and waited on the Pretender only to give him his reasons, in person, for refusing to join him. On his way to Charles, the chieftain met with his brother, to whom he imparted the purpose of his journey. Brother, said the younger Cameron, I know you better than you know yourself; if the prince sets eyes on you, you are a lost man. Lochiel, however, proceeded, and the event was as the other had predicted. Lochiel having intreated the prince to remain concealed, at least for a while, till his friends should have consulted; Charles im-

patiently replied, that in a few days he would erect his standard, and put all to the hazard. Lochiel, said he, who my father has often told me was our firmest friend, may stay at home, and learn from the newspapers the fate of his prince. The reproach of disloyalty touched the Highlander, and swayed him against his better reason. No, said Lochiel, I will share the fate of my prince, and so shall every man over whom nature or fortune has given me any power. Such was the conversation, on the result of which peace or war depended; for if Lochiel had persisted in refusing to take arms, it is certain that the other chiefs would not have joined the standard of rebellion. In a short time Charles was joined by other clans, and, advancing from Lochaber, his army still increasing as he proceeded, he reached Perth, where he is said to have shewn, to one of his friends, the only guinea in the world which he possessed. He levied contributions, however, and proclaimed his father king. Entering Edinburgh, without opposition, he repeated the same ceremony; and learning that sir John Cope was approaching with the royal forces, he marched out to Prestonpans, about ten miles from the Scottish capital, and put the royal troops to a total rout, with the slaughter of 500 men. This victory gave hopes; more sanguine than solid, to his party. He was joined, at Edinburgh, by the earl of Kilmarnock, the lords Elcho, Balmerino, Ogilvie, Pittligo, and the eldest son of the old lord Lovat, a traitor, who had fluctuated in his infidelity between the houses of Stuart and Hanover; and who now secretly aided the Pretender, while he openly professed his loyalty to government. While Charles was unwisely delaying at Edinburgh, the government was active in preparation; and the people, though unaccustomed to arms, and terrified by the suddenness of the irruption, voluntarily embodied, and trained themselves to arms. Six thousand Dutch troops, in the mean time, came northward, under general Wade; and the duke of Cumberland arriving from Flanders, was followed by a detachment of dragoons and infantry.

Charles, at last, resolved upon an irruption into England. He crossed the western border; took the town of Carlisle; and, at Manchester, was joined by 200 men. On the 4th of December, the rebels reached Derby. They advanced within 100 miles of the capital, which was filled with dismay at his approach; and had they reached it immediately, the consequences, though they could not have been fatal to the reigning family, might have been productive of temporary confusion. But Charles, who was in fact, only the nominal leader of his independent chieftains, was overruled in his designs, and it was resolved that his army should retreat into Scotland. They effected their retreat without any loss, and without being overtaken by any considerable body of the duke of Cumberland's army, except at Clifton, where they exhibited the uncommon spectacle of infantry not awaiting the shock of dragoons, but rushing up to attack them, sword in hand, and driving them from their ground. Continuing to retire northward, they left a garrison of 400 behind them, at Carlisle, who, soon after, surrendered prisoners at discretion. On their return to Scotland, they levied a heavy contribution on the opulent city of Glasgow; and proceeding from thence to Stirling, took possession of the town, but continued an ineffectual siege of the castle. To relieve this place, general Hawley assembled a number of forces at Stirling, and gave battle to the Highlanders, who came, on the 17th of January 1746, in full spirits to attack him.

VOL. IV. PART II.

They threw the troops, under Hawley, into disorder at the first volley; rushed forward with their claymores, and mixing his cavalry and infantry, in one route, put them to flight, and took possession of the tents and artillery of the king's forces.

But the victory of Falkirk was the last of Charles's triumphs. The duke of Cumberland had put himself at the head of 14,000 men, who were assembled at Edinburgh, and advanced northward as the young adventurer retired. When he had passed Aberdeen, where he was joined by the duke of Gordon and other loyal Scotch nobility, he continued his course across the Spey, till he learnt that the rebels were advancing from Inverness, nine miles distant, to give him battle on the plain of Culloden. Their numbers amounted to 8000, who were drawn out to receive him. At one in the afternoon of the 15th of April the cannonading commenced; the rebel artillery was miserably served, and did no execution; but the duke's artillery made lanes among the Highlanders. While the cannonade continued, the duke observing a wall upon the right of the Highlanders, ordered a body of his men to advance, and pull it down. The order was obeyed, and the flank of the rebels immediately became uncovered. The front of the rebel Highlanders being at the same time exposed to a dreadful fire of artillery, the men, by instinctive valour, advanced to the attack sword in hand, broke through two regiments, Burrel's and Monro's, and pressed on to the second line of the royal army. In this situation, they were calmly expected by the second line of the royal army in front, and by Wolfe's regiment, which had broken down the wall, on their flank. A few, and but a few, of the assailants in this quarter escaped. The bravest who did not fall by the fire, perished in conflict with the English bayonets. Lochiel was advancing at the head of a small troop who survived, and was charging the English ranks, when he fell by a discharge of grape-shot, which wounded him in the ancles, while he was in the act of drawing his sword. He was carried off by his two brothers, between whom he had advanced. Macdonald of Keppoch was rushing on in the same manner, when he received a wound which brought him to the ground: he was conjured by a friend not to throw his life away, but to retreat, and rejoin his regiment. He desired his friend to provide for his own safety; and, going on, received another shot, by which he fell to rise no more.

Most of the chiefs who commanded the five Highland regiments who advanced to the charge were killed, and almost every man in the front rank of each regiment. The rebel regiments on the left, seeing the fate of their countrymen, did not advance to close combat; but only so near as to exchange a general discharge with the right wing of the duke's army; after which, they answered the fire of some of the dragoons who pursued them; and then dividing into separate bodies of different sizes, were either cut to pieces, or retreated, according to their numbers, or that of their immediate pursuers. In less than thirty minutes the battle was converted into a general route; and orders being issued to give no quarter, vast numbers were slain in the pursuit. The pretender escaped with great difficulty from the field of battle; and after wandering for the space of many months a solitary fugitive among the wilds of Scotland, he found means to embark on board a small vessel, which conveyed him to Morlaix in Bretagne. Thus ended the last effort of the Stuart family, to reascend that throne which had been forfeited by the most egregious

folly, and the most flagitious attempts. The executions which ensued on the suppression, seemed much more numerous than the necessity of the case required. The lords Balmerino, Lovat, and Kilmarnock, suffered the sentence of decapitation on Tower-hill, as did also the earl of Derwentwater, without any form of trial, being arraigned on the sentence passed against him in 1716. The earl of Cromarty, only, received a pardon. Both houses of parliament presented addresses of congratulation to his majesty, and thanks to his royal highness the duke of Cumberland, who now became the idol of the nation, and was held every where up as the saviour of the Protestant interest.

An important act of parliament was passed immediately after the suppression of the rebellion, by which the heritable jurisdictions of the Highland chieftains were abolished. A law was also passed, forbidding the Highlanders to wear the garb by which they were distinguished. The policy of emancipating the Highland vassals cannot be doubted; but the conquest of their affections remained still to be made. Under the wise administration of Chatham, a conciliatory system was adopted, and their favourite national garb was restored. It was not until the latter period, that the nation reaped the full benefit of the bravery and loyalty of a true, simple, and energetic Celtic race of mountaineers.

About the same time the English made an expedition to the coast of France, in order to attack Port L'Orient, from which they came off with neither honour nor advantage. The fleet under admiral Lestock, with six battalions of regular forces on board, arrived on the 20th of September, in Quimperlay Bay, ten miles distant from the city, which was immediately summoned to surrender. In the first emotions of surprise and consternation, a capitulation was agreed to, on condition that the magazines of the company, on the payment of 40,000*l.*, should remain untouched, and the inhabitants be protected from pillage. These terms the British commander haughtily rejected, and the inhabitants, driven to despair, prepared to defend themselves. The invaders were destitute of artillery and implements for a siege, and they played ineffectually with a single battery upon the town. At length the troops in the neighbourhood, and the provincial militia, collecting in force, compelled the general to reembark, and return to Portsmouth.

The French, at the same time, gained an important victory at Rocoux, in Flanders, over the allies. The Dutch, who had beheld the progress of the French arms in the Netherlands with terror and apprehension, had been at last driven to declare against their most formidable enemy; and by a tumultuous sedition, similar to that which, in the last century, had saved their commonwealth, the people were excited to depose their magistrates, and to confide the supreme power over the army and navy to the prince of Orange. But, however spirited and wise their resistance to France might have been, they were in the present conflict necessarily, from being the weakest, the greatest sufferers. A victory gained over the allies at La Feldt filled them with distrust of their own generals, and the taking of Bergen-op-Zoom drove them to despair. These disasters, it is true, were balanced in some degree by the losses of the French in Italy, where their general, the brother of the marquis de Belleisle, was slain, and his whole army put to the route in attempting to penetrate into Piedmont. Nor were the naval successes of Britain

discontinued. In April 1747, a squadron sailed from Brest for America, commanded by admiral La Jonquiere, who were encountered by a superior fleet under the English admirals, Anson and Warren. Six ships of the French line struck their colours, and the greater part of their convoy and frigates were taken. In the month of October, admiral Hawke, with a superior force, fell in with nine French line of battle ships, seven of which he took, after an obstinate engagement.

The variety of success served to make all the powers at war heartily desirous of peace. The king of France was sensible that the moment of success was the most advantageous opportunity of proposing terms; and even expressed his desire of general tranquillity to sir John Ligonier, who was made prisoner at the battle of La Feldt. In the new parliament, which met at the end of the year, his Britannic majesty announced that a congress would be speedily opened at Aix-la-Chapelle, for concerting the means of a general pacification. As the event, however, was uncertain, the subsidies and supplies of parliament were renewed, and an additional subsidy was granted to the empress of Russia, whom England had now to class with the empress queen of Hungary, the kings of Denmark, Sweden, Poland, and Sardinia, and a multitude of Germanic sovereigns in her band of mercenaries. But previous to the termination of the session (May 1748,) the king informed the two houses, that the preliminaries of peace were actually signed, and that the basis of the accommodation was a general restitution of conquests. The treaty of Aix-la-Chapelle must undoubtedly, upon the whole, be considered as favourable to the allies. France, for the sacrifice of all her conquests, required no other compensations than the cession of the duchy of Parma, with its appendages, to the infant don Philip, territories of which that prince was already in possession. By this treaty, England resigned Cape Breton, to obtain the restitution of Madras. With Spain, England had little occasion to negotiate. In a war of nine years, nothing had been gained or lost, but Portobello, which had been immediately evacuated. The original cause of the war seemed in the course of it to be entirely forgotten; and at the conclusion of the peace, not a syllable was mentioned respecting the pretended right of search, which had formerly occasioned such loud and indignant clamours. The settlement of the boundaries of the French and British empires in America was referred to the decision of commissioners. France retained no mark of superiority in this treaty with relation to England, excepting the restitution of hostages to reside in France, till the reciprocal retention of conquests should be actually made, and the earls of Sussex and Cathcart were nominated for that purpose. This afforded the patriots a pretence to exclaim against the peace as disgraceful to the nation; but the nation, which had reason to be wearied with the expences and disasters of the war, were well satisfied with the terms of the peace, and it was celebrated with universal rejoicings. A profound tranquillity in domestic affairs succeeded the peace of Aix-la-Chapelle, till the death of Mr Pelham in 1754, in the meridian of his life, reputation, and usefulness. He lived and died esteemed and lamented, both by the sovereign and the nation. Mr Legge, a man of honour and capacity, succeeded him as chancellor of the exchequer. The seals being consigned to sir Thomas Robinson, formerly ambassador at the court of Vienna, a minister of very moderate political attainments, the post of first lord of the

treasury was occupied by the duke of Newcastle. But it soon appeared how unequal were the talents of this nobleman to sit at the helm of affairs, when deprived of the assistance of Pelham. If we seek for the origin of the war, which, at the distance of some years from the peace of Aix-la-Chapelle, was created between France and England, we shall find it kindling up at one and the same time in Europe, Asia, and America. By the treaty of Utrecht, the English had been acknowledged as the rightful possessors of Nova Scotia, in North America. But the province of Nova Scotia being ceded to England according to the ancient limits of that territory, fruitless and endless altercations arose as to the import of this expression, between the commissaries of the two nations, to whom the right of fixing the boundaries of the royal empire was assigned; the English claiming the whole territory as far as the southern bank of the river St Lawrence, and the French admitting their right only to the peninsula of Acadie.

Another source of dispute, also, sprang up in the same quarter of the world. The French, pretending to have first discovered the mouth of the river Mississippi, claimed the whole country towards New Mexico, on the east, quite to the Apalachian mountains on the west. On this pretence, a systematic and artfully contrived plan was formed to connect these widely distant establishments, by the gradual erection of a chain of fortresses, from the lakes Erie and Ontario, along and beyond the Ohio, to the mouth of the Mississippi. In order to assert their claims, as they found many English who had settled beyond these mountains, they dispossessed them of their new settlements, and established forts to command the adjacent country. In this dispute, the native Indians, both from interest and partiality, sided almost universally with the French.

Negotiations, mutual accusations, and partial hostilities, between the two powers, for some time preceded an open declaration of war. At last more important operations commenced. In the year 1755, general Braddock sailed from Cork; and, on his arrival in Virginia, took the command of the forces destined to act against the French on the Ohio. Braddock was courageous, but obstinate, and acquainted with regular war; but attached to the pedantry of discipline; and so deficient in sense, as to imagine the tactics of Europe strictly practicable among the swamps and forests of America. He treated with disdain the advice of the provincial officers, who best knew the enemy he had to engage; and took no precaution against the stratagems which he was warned to expect. Having advanced, in fearless security, to less than ten miles of Fort du Quesne, without reconnoitring, he was saluted, in the midst of a pathless swamp, by a fire in his front and flank, from a concealed enemy. Too high spirited to think of retreating, he gave directions to the few brave men who kept beside him to form and rally, and advance according to the regular rules of war. In this condition he remained, giving orders with great composure, while his officers fell thick around him, till he fell dead by the shot of a musket. The main body of his troops had fled, and their retreat was covered by the provincials, under major Washington, whom he had so much despised. All the artillery, ammunition, and baggage of the army, were left to the enemy, and seven hundred men were lost; the rest retreated to Philadelphia.

On the death of Braddock, the chief command devolved upon General Shirley, who formed a plan for the

reduction of the important fortresses of Crown Point and Niagara, erected by the French on the banks of the lakes Champlain and Ontario. The troops, destined for this service, arrived at the place of rendezvous late in the summer, and were, soon after the commencement of their march, attacked in their camp by Baron Dieskau, the French commander, who was repulsed with great loss. General Johnson, however, found himself, after this bloody encounter, too much weakened to proceed in his expedition, and retreated to Albany. Thither, also, General Shirley returned; the purposed enterprise against Niagara being deferred till the next campaign.

While the operations of the English were thus languid and unsuccessful, the French, under General Montcalm, captured Oswego, though strongly garrisoned and plentifully provided. In the succeeding year, 1757, they laid siege to the important post of Fort William Henry, and captured it in six days. By this conquest the French obtained the command of the extensive and magnificent chain of lakes, which connects the rivers St Lawrence and Mississippi. And thus disgracefully terminated the third campaign of the American war, in which the French, with a very inferior force, had maintained an uniform superiority; and, in the course of which, no advantage had been gained by the English, except the expulsion of the French from Nova Scotia, by the vigorous exertions of Colonel Moncton, assisted by a body of the provincials, raised by the Massachusetts assembly.

Some atonement for these disasters in America, was found in the captures which the English made at sea. Letters of reprisal had been issued by the English court, as early as 1755, before a regular declaration of war, and 300 merchantmen, for the most part unsuspecting of danger, had fallen into their hands. The French complained of this breach of public honour, with some reason; not that their own hostile intentions were to be doubted, but because the ceremony of declaring war was easy, and should have been observed. The truth was, that British ministers fluctuated between peace and war. An opposition had arisen, which weakened and distracted them—the opposition of Mr Pitt and Mr Legge to the measures of the court. Mr Pitt declared that the whole system and scheme of politics was absurd. Already alliances had been made, by which one half of the continent was subsidized, for the sole purpose of defending Hanover. The Prince of Hesse Cassel was to hold in readiness 12,000 men for that purpose; and Russia was paid to maintain 55,000 horse and foot for the same object. But, by adopting Prussia as an ally, the aid of Russia was virtually lost to Britain. The Empress Elizabeth sided with France, when she saw his Britannic majesty sign a treaty with Frederick. Mr Pitt and Mr Legge deprecated this whole system of continental connections; a system which, the former statesman declared, would, in a short time, cost us more than the fee simple of the electorate was worth; and he ardently wished to break those fetters which chained us, like Prometheus, to that barren rock.

These declarations were immediately followed by the dismissal of Mr Pitt and Mr Legge from their respective employments. Mr Henry Fox, after these changes, accepted of the seals. The administration was new modelled in other respects; but, though led by the talents of Fox, it was still divided and unpopular. The first efforts of the cabinet were directed to ward off a blow which France threatened when the war commenced,

namely, the invasion of the island; and in these their conduct neither gave confidence, nor gained popularity. Instead of adopting a broad and patriotic plan of defence, that of arming the people to defend themselves, they grasped on all hands for mercenary aid, and 10,000 Hanoverians were brought over to defend ten million of Englishmen. While the nation and ministry were thus fearfully watching the preparations at Dunkirk and Brest, a formidable fleet was equipped at Toulon, which at last sailed to attack Minorca. When its destination was notorious, a squadron of ten ships of the line was dispatched under Admiral Byng, with orders to relieve Minorca, or, at any rate, to throw a body of troops into the garrison. Byng, with a fleet which, though inferior to the French, would yet have been led to battle, and probably to victory, by a spirited commander, had a partial engagement with, and suffered them to escape. He returned home without accomplishing the relief of Minorca, was brought to trial, and perished by the sentence of a court-martial. By one half of the nation his fate was regarded as a terrible, but necessary example; by the other half he was considered, as he styles himself, not without appearance of reason, a victim, destined to divert the indignation and resentment of an injured and deluded people. Notwithstanding the sacrifice of this victim, the nation exhibited symptoms of the highest dissatisfaction at the conduct of the administration, under whose guidance nothing but disaster had occurred. The Duke of Newcastle and Mr Fox, finding the tide of popularity set strongly against them, determined, by a timely resignation, to avoid a compulsive dismissal. In November 1756, Mr Pitt was appointed principal secretary of state, and Mr Legge reinstated in his post of chancellor of the exchequer. Yet, with all the popularity of the principal characters of this ministry, it soon became impossible to conceal, that the higher parts of it were in a convulsive state of quarrel with its lower and baser ingredients,—the subservient creatures of the court, who had been allowed to remain in it. The favourite project of the king, for strengthening the army in Germany with large reinforcements from England, was not agreeable to the patriotic ministers Pitt and Legge. His majesty, irritated by their opposition, at length resolved upon an effort to relieve himself from their controul; and in April 1757, they were suddenly dismissed from their offices, the chancellorship of the exchequer being consigned, *pro tempore*, to the chief justice of England. Mr Fox again took the lead in affairs; but the alarm of the nation at the dismissal of the popular ministers was lively and undisguised. Mr Fox, perceiving it impossible to stem the torrent, wisely consulted the monarch to yield to the wishes of the people. And in June Mr Pitt resumed the seals of secretary of state; Mr Legge and the Duke of Newcastle their former stations at the board of treasury; Lord Anson was placed at the head of the admiralty; and Mr Fox himself, acceding to the new order of things, was gratified with the lucrative office of paymaster-general of the army.

The recal of Mr Pitt to the helm of affairs produced, in a few years, the most successful efforts of national vigour that ever were made; but the tide of success did not immediately change. An ineffectual attempt was made upon Rochefort by a naval, land, and marine force, under Sir Edward Hawke and Sir John Mordaunt, in which the commanders had no other success than that of reducing the little island of Aix, after which they

returned immediately to England. But the indignation of the country could attach no blame to the administration that planned this enterprize; the whole fell upon its immediate conductors. In Germany, affairs were not more fortunate. There, the Duke of Cumberland, at the head of 50,000 confederates, was opposed to the Mareschal d'Etrees, the French commander, whom he suffered to cross the Weser without disputing the passage, and before whose forces he ordered his own to retreat, before the battle of Hastenback was irretrievably lost. Retreating after this engagement, the duke was enclosed between the German Sea, the Elbe, and the Weser; and in September was obliged, at Cloister-Seven, to sign the disgraceful capitulation known by that name, by which his Hessians, Hanoverians, and Brunswickers, to the number of 40,000, were obliged to disarm and disband.

By this time the King of Britain had thought proper to drop the connection of Russia to obtain that of Prussia. From this choice a new combination took place among the European powers, quite opposite to the former state of things, and the forces of the different powers were thus drawn out: Britain opposed France in America, Asia, and on the ocean. France attacked Hanover, which the king of Prussia undertook to protect, while Britain furnished troops and money to second his operations. Austria had fixed her aims on the dominions of Prussia, and drew the Elector of Saxony into the same designs. In these views the Austrians were seconded by France, Sweden, and Russia, the last of which powers had hopes of acquiring a settlement in the west of Europe.

The war, however, soon took a brighter turn. In America, General Amherst concerted with General Abercrombie a spirited and judicious plan of operations for the campaign of 1758. Conveyed by the fleet of Admiral Boscawen, he took Louisburg, with the whole island of Cape Breton, and a fleet of six French ships that lay anchored in the harbour. General Abercrombie, who undertook to reduce all the enemy's forts on the lakes George and Champlain, was at first dispirited by a repulse which he sustained at Ticonderoga; but detachments of his army, under Colonel Bradstreet and General Forbes, separately, reduced the forts Frontenac and Du Quesne; and in October of the same year peace was established, by a formal treaty, between Great Britain and the Indians inhabiting the rich and fertile plains between the lakes and the Ohio. In the succeeding year, Ticonderoga itself surrendered, and fort Niagara capitulated to General Johnson.

But by far the most difficult part of General Amherst's plan, the reduction of Quebec, was intrusted to General Wolfe. In the month of June 1759, the armament, destined for the invasion of Canada, arrived at the island of Orleans, formed by the branches of the river St Lawrence, and extending to the basin of Quebec. On the left of this river were posted 10,000 French, under General Montcalm, who repulsed the British in an attempt to pass from the island of Orleans; but the disappointment, though it sunk deep in the haughty spirit of the British commander, did not prevent him from trying the only effort that remained to be tried, one transcendently bold and admirably executed. To deceive the enemy, he moved up the river several leagues beyond the spot fixed on for landing; but, during the night, he fell down with the stream, in order to protect the disembarking of the troops, which was happily accom-

plished in silence and secrecy. The precipitous heights of Abraham were next ascended; and, with infinite labour and difficulty, the troops sustaining themselves by the rugged projection of the rocks, and by boughs of trees and plants, which sprang from its clefts, gained the summit, and formed in order of battle. Montcalm immediately hastened with his army, from his camp at Montmorenci, and gave battle to the British to save the town. Wolfe, advancing at the head of the grenadiers, was at first slightly wounded in the wrist, by a ball from one of the enemy's marksmen; he continued, however, to give orders, inattentive to the wound, with a handkerchief wrapt round his wrist, till a second shot pierced his breast. Expiring in the arms of victory, he had but time to learn that the enemy fled. The generals Moncton and Townsend continued the fight, after the fatal wound of their commander, with unabated ardour. The death of Montcalm, the French commander, who also received a mortal wound, was fatal to the enemy. They gave way on all sides. The city of Quebec, though provided with the means of defence, surrendered in consternation, and the shattered remains of the French army retreated to Montreal. The French made a vigorous effort, the following season, to recover Quebec; but were entirely repulsed by the resolute defence of the garrison, and the appearance of Lord Colville's fleet. The reduction of all Canada soon followed that of its capital, the most important acquisition of territory ever made by the British arms. An almost uninterrupted prosperity, for some years, attended the operations of England. Fort Louis, on the river Senegal, surrendered without effusion of blood, to a small squadron under Captain Marsh. Goree, on the south of the same river, surrendered to Admiral Keppel; and Gaudaloupe was taken by Commodore More and General Hopson. Our attempts upon the French coast were, as usual, unfortunate. Cherbourg was, indeed, taken by Commodore Howe, who destroyed the harbour and bason of that place; but the same armament having sailed back from England, and disembarked the land troops to the westward of St Maloes, General Bligh, their commander, was alarmed, in the midst of his march into the open country, by intelligence that the governor of Bretagne was advancing, to cut off his retreat, at the head of a powerful army. The English hurried back to the bay at St Cas, where their fleet lay at anchor, but could not escape to their ships, till their rear guard, of 1500, were slaughtered almost to a man. It can scarcely be presumption to impeach the policy of these expeditions to the enemy's coast, which so uniformly terminated in disaster, although they were sanctioned by the recommendation of the elder Pitt himself, who used to boast that he could, at any time, singe a few yards of the French coast. Such attempts, when we consider their expense, their vanity, and their bloodshed, may be allowed to have been compared, with much more propriety, to the folly of breaking windows with guineas. The British admirals asserted their country's honour more effectually. Boscawen intercepted the fleet of De la Clue, off Cape Lagos, and, after a fierce conflict, captured five of the enemy's capital ships. A second victory was obtained off Quiberon, by Admiral Hawke, in a manner still more creditable to British seamanship. Undismayed by the rocks, shoals, and quicksands, of a shore, to which the French retired, Hawke pursued them, in the midst of the tempestuous month of November, and gave them battle. Two of

their capital ships were sunk during the action. Another struck her colours, but no boat could be sent to take possession of her; and three others were stranded or destroyed.

Our arms, in the East Indies, were distinguished by splendid achievements. The war, in that remote quarter, began by each power siding with two contending native princes; and thus, by degrees, becoming principals in the dispute. The viceroy of Bengal, declaring against the English, laid siege to Calcutta, a fort, which was in no situation to repel the attack even of barbarians. It was taken by assault, and a part of the garrison, to the number of 146 persons, were crowded into a small prison, called the black hole of Calcutta, and perished in circumstances horrible to be related. General Clive, however, soon avenged this dreadful transaction, and retrieved the affairs of our eastern dominions. Aided by a fleet under Admiral Watson, he first subdued a piratical Prince Angria, who had annoyed the company's settlements in the neighbourhood of Bombay; then marching into Bengal, defeated the forces of the reigning Subah with a handful of men, assisted his subjects in dethroning him, and placed another attached to the English interests in his stead. The affairs of the company being thus triumphantly re-established in the northern provinces, the attention of their council and commanders was called to the coast of Coromandel. General Lally, an active military character in the service of France, laid siege to Madras, in 1758; but he was driven from thence, by the arrival of Captain Kempenfelt, with reinforcements to the garrison, and retreated precipitately to Arcot. A year after this event, Lally was completely defeated, by General Coote, in the Carnatic, and was, at last, blockaded by sea and land in Pondicherry. The fortunate capture of this proud and opulent capital of the French Indian dominions completed our triumphs in the east.

The disgraceful convention of Closter-Seven had spread dissatisfaction through England, but as soon as it was known that Prince Ferdinand of Brunswick had put himself at the head of the Hanoverian army, the most sanguine expectations were excited, and the most liberal supplies were granted by parliament. The renewed energy, in the conduct of the German war, as far as England was concerned, was indeed no less owing to the character of the minister than of the people. The interest of the nation was deeply excited by the dangers, the difficulties, and the romantic exploits of Frederick of Prussia. Mr Pitt, himself, who had risen to popularity by declaiming against German subsidies, whether smitten by this contagious sympathy, or anxious to finish the war by vigorous measures, in a quarter where he saw that his sovereign's inclination was unchangeably bent on hostilities, acquiesced in the alliances, and in the warlike measures which he had formerly so much condemned. A body of British forces were sent over to join Prince Ferdinand, under the duke of Marlborough. The command of these devolved, by the death of Marlborough, on Lord George Sackville, after a few inconsiderable successes of the allies at Crevelt. In the glorious and decisive battle of Minden, the British cavalry were brought forward, by Sackville, too late in the action to be of the smallest service; but the English infantry, commanded by Waldegrave and Kingsley, bore the brunt and chief credit of the day. They not only sustained, with the utmost intrepidity, the repeated attacks of the French, but charged them in

their turn, and totally routed the Gendarmerie carabiniers, and the choicest veterans of the French. After this victory, it was expected that another reinforcement would totally turn the scale of fortune, in favour of the allies, but the reinforcement arrived, and no advantage accrued. The English, at last, began to open their eyes to their own interest, and to see that in Germany they were waging unequal war, and assuming new loads of taxes, for conquests which they could neither preserve nor enjoy. Amidst the events which ultimately contributed to this change of sentiment, George II. died suddenly on the 20th of October 1760. He had risen at his usual hour, and expressed an intention, as the weather was fine, of walking out. In a few minutes, being left alone, he was heard to fall upon the floor. When his attendants, who were brought into the room by the noise of his fall, lifted him into bed, he desired that the Princess Amelia might be sent for; but, before her arrival, he expired, in the 77th year of his age, and in the 33d of his reign. In his private character, though his temper was violent, his principles were good, and his conduct frugal, plain, and sincere. His public virtue cannot entirely be sullied by the charge of a predilection for his native country, since that passion itself was a partial virtue. Without having the merit of extending patronage, he saw the arts flourish under his reign; and, with an ordinary capacity, he enjoyed the longest and most glorious of all English reigns.

All historians concur in representing the period of his present majesty's accession as singularly auspicious. The war was conducted successfully, by a most popular administration. The natural partiality of subjects, for a young sovereign, was increased by the purity of his morals, and the singular graciousness of his manners. The speech delivered from the throne, at the first meeting of parliament, was well calculated to support and increase this popularity. "Born and bred a Briton," said the young monarch, "I hold the civil and religious rights of my people equally dear to me, with the greatest prerogatives of my crown." It was strongly recommended, to parliament, to support our great ally the king of Prussia, and the liberality of parliament was evinced in voting more than 19 millions, (including a subsidy of 650,000*l.* for his Prussian Majesty,) for the support of 50,000 land forces, and 70,000 seamen.* The civil list was settled at 800,000*l.* per annum, a sum now charged on the aggregate fund, in lieu of the hereditary and other specific revenues, which had been assigned to the late king. A most popular act distinguished this session, which passed at the immediate recommendation of the throne. Hitherto the commissions of the judges expired, according to law, with the demise of the sovereign; and though, in fact, no instance had occurred, since the Revolution, in which the new successor had exerted his privilege of changing them, yet it was thought proper to complete their independence, by extending their commissions during good behaviour.

An event which took place the very day on which parliament was dissolved, seemed to bode ill to that union and good harmony which had been so strongly recommended in his Majesty's speech, and to verify the fears of those who had predicted the growth of Tory

principles in the new monarch, from his education under the earl of Bute. The popular and patriotic minister Legge, a man of whom Sir Robert Walpole was accustomed to say, emphatically, that he never knew a man who had less "*rubbish about him*," was dismissed from the chancellorship of the exchequer, and Sir Francis Dashwood, a well known *Tory*, was put in his place. At the same time, the compliant Lord Holderness, who had intimated to Lord Bute at the accession, that he was ready at a moment's notice to throw up his office, in a pretended quarrel with the Whigs, now kept his promise, and retired in "*seeming anger*," but with a pension of 3000*l.* per annum. Lord Bute was appointed secretary of state, and Charles Jenkinson, afterwards Lord Liverpool, was made his confidential secretary.

His majesty's union with the Princess Charlotte of Mecklenburgh Strelitz, together with their coronation, was joyfully celebrated throughout the kingdom. In spite of the late changes in the ministry, war was ably supported. Though the gallant Frederick was hardly pressed, Prince Ferdinand, with the allies, signalized the summer campaign of 1761, by defeating the French at Kirch Derken, with the loss of 5000 men. The island of Belleisle surrendered to General Hodgson and Commodore Keppel, after its capital had been taken by storm. Dominica was reduced in the West Indies, and Pondicherry in the East. Yet the nation was not so dazzled by the splendour of victory, as to be blind to the expences of the war. A negotiation preferred by France was now continued, and promised a fortunate issue, when it was suddenly interrupted by an event, which brought a new enemy to act against us. Spain, deeply meditating the family compact, betrayed her designs, by what was considered as an impertinent interference between the belligerent powers. This necessarily roused Mr Pitt, who, seeing at once the whole of the project, proposed to declare war against that kingdom. But finding himself unsupported, he somewhat haughtily (perhaps, however, justly) declared, that he would take no part in councils which he was not permitted to govern. His resignation immediately followed. His majesty accepted it with expressions of regret, and, as a just reward well due to his services, settled on him a pension of 3000*l.* a year. He was succeeded by the Earl of Egremont. Mr Pitt's vigilance as a minister was soon evinced by the open avowal of that family compact, which his antagonists had derided him for suspecting. England was necessarily drawn into a war with Spain; and Portugal, as the ally of England, was invaded, and nearly given up to conquest. But the influence of Mr Pitt's plans outlived his continuance in office. Martinique surrendered to our arms, and Spain in a very few months lost Havannah, Manilla, and all the Philippine Islands. The inhabitants, of Manilla saved their property, by promising a ransom which was never paid. In the mean time, the bravery of the British troops, and the conduct of the Count La Lippe Buckeburgh, who commanded them, changed the fortune of the war in Portugal, and repelled the Spanish invader. In Germany, Prince Ferdinand, ably seconded by the Marquis of Grandby, gave a signal defeat to the French at Grabenstein, and the enemy was driven out of South Cassel.

* It is particularly worthy of notice, that in this session, 176th, 200,000*l.* were voted, in consequence of a message from his Majesty to the several provinces of America, expressly as a compensation to them for their extraordinary expenses, incurred by their vigorous exertions during the war.

The career of victory was stopt by a still more desirable event. A negotiation for peace was again set on foot. The duke of Bedford was sent over to Paris, and the duke de Nivernois came to London. A definitive treaty was signed at Paris on the 10th of February 1763. The French gave up all Canada, that part of Louisiana east of the Mississippi, Cape Breton, Senegal, the islands of Grenada, Dominica, St Vincent's, and Tobago. Spain ceded Minorca, East and West Florida, and all her possessions east or south east of the Mississippi, renouncing her pretensions to the Newfoundland fishery, and confirming to Britain the right of cutting logwood in the Bay of Honduras. France renounced in the East Indies all acquisitions made on the Coromandel coast, since the year 1749. Portugal was reinstated in all her dominions: the French were to withdraw from the Hanoverian, Hessian, and Prussian territories. In return for these cessions, Britain gave up to France, Belleisle, Goree, Gaudaloupe, Martinique, St Lucia and Pondicherry, and Chandernagore, in the East Indies; recognised her right to fish on the banks of Newfoundland, and ceded the small islets of St Pierre and Miquelon. To Spain we restored Havannah, the Manillas, and our other conquests. A violent outcry was occasioned by the terms of the peace. Chatham himself raised his voice with indignation against it; but we ought not to be dazzled by the authority of patriotic names. The terms were at least fair, honourable, and advantageous. In a single year's continuance of the war, the country might have spent ten times the value of any acquisition which she gave up, by moderating her views.

The conclusion of the war was followed by the downfall of the minister. This was partly accomplished by the power and genius of Pitt, and the Whig interest in parliament; but still more by the popular outcry which was raised against the minister, and by the virulent publications which issued from the press. At the head of those popular writers was John Wilkes, the member of parliament for Aylesbury, and editor of a paper called the North Briton, remarkable for its invectives against the ministry, and its scurrility against the Scotch nation. To the flame of popular hatred the minister at last yielded, and was succeeded by Mr George Grenville, who began his ministerial career by prosecuting Wilkes. This demagogue had not scrupled, in one of the numbers of the North Briton, to accuse his majesty directly of falsehood. The king's messenger, by virtue of a general warrant, entered Mr Wilkes' house, and apprehended him. After being examined before the secretaries of state, he was committed to the Tower, and his papers were seized and sealed up. A few days after, he was brought to Westminster-hall by habeas corpus, and released by Lord Chief-Justice Pratt, in consideration of his being a member of parliament. The parliament ordered the seditious paper to be burnt by the hands of the common hangman,—an operation that produced a riot, not in itself dangerous, but which served to discover the angry spirit of the populace. Mr Wilkes was soon after expelled from the House of Commons, and found it prudent to retire to the Continent. The intemperance of party was never so violent as at this period; but, however contemptible the origin of the tumult, the effects were favourable to liberty. General warrants lost their supposed legality, and the seizure of papers, in consequence of such warrants was no longer to be sanctioned.—When Wilkes prosecuted the secretary of state

for seizing his papers, he obtained a verdict of damages. It was on this memorable occasion, that Chief-Justice Pratt, after pronouncing the warrant under which Mr Wilkes was seized illegal, concluded his speech with these words: "If the higher jurisdiction should declare my opinion to be erroneous, I submit, as will become me, and kiss the rod; but I must say, I shall always consider it as a rod of iron for the chastisement of the people of Great Britain." The administration of Mr Grenville was the source of misfortunes to Britain, which are felt at the present day. For a long time there had existed a trade between the Spanish and American colonies, which, though nominally illicit, was wisely connived at, as it supplied the Americans with their only means of obtaining specie. When ministers found, that their effectual efforts to stop this trade had produced only distress to our own trade, they enacted a law which seemed to legalize it; but such duties were enjoined, as in fact amounted to a prohibition. To complete the climax of impolicy, Mr Grenville enlarged the plan of taxation, by a measure which Sir Robert Walpole, in all the plenitude of his power, had declared that he durst not attempt. This was to raise a direct revenue from America. For this purpose, the celebrated stamp act was passed in March 1765. It was carried through the commons by a great majority. Those who opposed it, contended more against the policy than the principle of the measure. General Conway alone protested against the right of Great Britain to exercise direct taxation over her colonies. On receiving authentic intelligence of the stamp act being passed, the indignation of America broke out into open deeds of violence. The ships in the harbour of Boston hung out their colours half mast high, as a signal of the deepest distress. The bells of the city were muffled, and rang out a dumb peal. The act itself, as soon as it came from the king's printing-house, was burnt by the populace, together with the effigies of the men most active in passing it. The masters of those vessels which had conveyed the stamps to America, were compelled to deliver up their cargoes to an enraged multitude. Those who had accepted commissions to act as distributors of stamps, were forced by public oath to renounce all concern in them. The justices of the peace in many parts gave notice, that they would not act in that capacity, to the subversion of the liberties of their country. The gentlemen of the law, in the exercise of their profession, universally renounced the use of British stamps. But the most alarming opposition was made by the merchants, who entered into solemn engagements, not to import any more goods from Britain till the stamp act should be repealed.

But while the Grenville ministry shewed their confidence and security by this bold act, they were approaching to their downfall. In the arrangement of a bill for eventually settling a regency in case of the demise of the crown, they gave offence to the court, by omitting the princess dowager of Wales. Overtures were secretly made to Mr Pitt and Lord Temple, by the party of Leicester house. These were discovered by Mr Grenville, who no longer thought of keeping measures with the Leicester house cabinet; but urged an immediate dismissal of Stuart M'Kenzie, the brother of Lord Bute, and of the Duke of Northumberland and Lord Holland, his known supporters.

Mr Pitt and Lord Temple answered the application of the court, by insisting on a total change of men and

measures. Finding them immoveable, the court applied to the Duke of Newcastle, and that body of the Whigs afterwards known by the name of the Rockingham party. Had these men joined in a manly adherence to Mr Pitt's terms, it is probable that secret influence would have received an irrecoverable blow; but unhappily the Newcastle party proved flexible, and the Duke of Cumberland, the negociator, had the happiness to see, before his death, the new administration settled in office.

The privy seal, with the patronage of the church, was given to the Duke of Newcastle. The Marquis of Rockingham became first lord of the treasury; Mr Dowdeswell, chancellor of the exchequer; the Duke of Grafton and General Conway, secretaries of state. The admiralty was assigned to Earl Egmont; and the great seal to Lord Northampton. Lord Temple, with great bitterness, but Mr Pitt, with a proper decorum, condemned an acceptance of place at a time when the court might so easily have been brought to terms. The new ministers, on the other hand, charged the friends of Mr Pitt with undue inflexibility, and with preferring to put all to hazard, when some great points might, with certainty, be secured.

The oppressive and vexatious regulations of the stamp act excited, as had been predicted, an immediate and general discontent throughout America; a spirit which broke out into open tumult in the neighbourhood of Boston. Intelligence of this alarming spirit had reached ministers before the meeting of parliament, which was opened by a speech truly marked with the liberal principles of the new ministers; and recommending conciliation to America.

On this occasion, Mr Pitt, with great manliness, stated his approbation of many of the new ministers, and declared that he was disposed to hope well from their measures. "But confidence," he added, "is a plant of slow growth in an aged bosom." George Grenville having inveighed against the Americans, the spirit of the patriot took fire, and burst forth into one of the most eloquent replies that ever echoed within the walls of any assembly. It concluded with emphatically urging the immediate, absolute, and unconditional, repeal of the stamp act.

A bill was accordingly almost immediately introduced for its abolition; and, notwithstanding a violent opposition, it passed both houses by a great majority. It was accompanied with a declaratory act, asserting the power and right of Great Britain to bind the colonies in all cases whatever.

This last act, when it reached America, was universally regarded as a mere salvo for the honour of the mother country; and, on that account, scarcely diminished the joy which was expressed at the repeal of the stamp act; nor, according to all human probability, would it have been ever enumerated by the Americans among their grievances, if the British government had not returned to the practical plan of taxation for a revenue. The Rockingham administration had the merit of reconciling America; and of other measures which, although of less importance, were also patriotic and popular. Several obnoxious taxes were repealed, and general warrants were declared illegal. Unhappily for the good of their country, their duration was short; and it is still more to be regretted, that they fell by the influence of that man who, on other great occasions, had never swerved from the interests of the state. Lord Chatham, probably prompted by resentment at the late

dereliction of the Rockingham Whigs, accepted a *carte blanche* from the court to come into power. He could not be ignorant, that the great cause of that offence, which the court secretly cherished against the Rockingham Whigs, was owing to their lenity towards America; yet he alienated himself from that moderate and respectable party, and vainly trusted to carry his own plans respecting America into effect in a ministry composed of Whigs and Tories, a discordant junction, which Mr Burke so aptly compared to a *tesselated pavement*. In the new ministry, the Duke of Grafton was appointed first lord of the treasury; Mr Pitt, now created Earl of Chatham, accepted the office of lord privy seal. Their associates in office were the Earl of Shelburne, Lord Camden, and Mr Charles Townsend. The last, who was by no means attached to the Whigs, was made chancellor of the exchequer. Scarcely had the ministry commenced their career, when the impolitic system of taxing the colonies was renewed. He introduced a bill for imposing a tax on tea, glass, and colours, imported into America; glossing over the measure as coming within the acknowledged principles of commercial regulation; whilst the payment of these duties into the British exchequer virtually amounted to direct taxation. This passed with little or no opposition at home. In this and other financial acts, Lord Chatham bore no part; being confined by extreme illness from executing any of the duties of his office. When, on the death of Mr Charles Townsend, Lord North succeeded to his place, Chatham was convinced, that his influence on public transactions was at an end, and he resigned; but he had not resigned before intelligence had arrived of the effects of Mr Townsend's new stamp act. America presented a scene of discontent bordering on rebellion; and though tranquillity was apparently restored at Boston, by an armed force, it was not of long duration. In the mean time a war had broken out in the East Indies between the British and Hyder Ally, which was carried on with various success. The Irish obtained an act, by which the parliament of that country, determinable formerly at the king's decease, was appointed to be chosen every eight years. Other events of lesser moment occurred in this year; but the public attention was chiefly engrossed by the reappearance of Mr Wilkes.

This gentleman, who had incurred a sentence of outlawry, returned to England just before the general election; and, with his usual boldness, offered himself to represent the city of London. The livery, however, were not prepared to accept his services, and his enemies were rejoicing in his defeat, when, to their surprise, he carried his election for the county of Middlesex, against the whole influence of great landed property, and the whole strength of government. His success was the signal for riot, and every species of tumult. A mob assembled round the King's Bench prison, to which Mr Wilkes was sentenced for two years; and the riot act being read in vain, the military fired upon the people, several of whom were killed and wounded. This served only to increase the popular rage, and tended ultimately to weaken the influence of administration. When, on the death of Mr Cooke, the other member for Middlesex, Mr Serjeant Glyn offered himself on the popular side, he carried his election against the whole interest of the court. At this election, a riot took place, in which some of the populace were killed. The murderers, though tried and convicted, found means to escape.

Wilkes had not yet taken his seat, when he published a letter, that fell into his hands, from lord Weymouth to the chairman of the Surry quarter sessions. This he chose to consider as the cause of the massacre committed in St George's Fields. A charge that so nearly affected the nobleman's character, was not passed unnoticed. Mr Wilkes was adjudged guilty of a breach of privilege, and expelled the House of Commons. The Middlesex electors again chose him; but the House of Commons declared his election void, and made out a new writ. To prevent him, if possible, from again succeeding, Mr Luttrell vacated his seat, and stood candidate for Middlesex. This gentleman, although he had not a fourth part of the votes which Mr Wilkes had, and was not returned by the sheriffs, was declared, by the House of Commons, to be duly elected. It was argued, that Mr Wilkes, having been once expelled, could not again be elected; and that as a vote for a man not eligible is not a legal vote, it followed, that Mr Luttrell had the majority of votes. The freeholders of Middlesex petitioned against a resolution which they deemed so unconstitutional; but the house voted, that, according to the law of parliament, a resolution once passed, could not be reversed in the same session.

These proceedings were considered so important to the nation, as to draw their attention from affairs which afterwards appeared to be more important. The parliament engaged in warm debates on the policy of taxing America, while the natives in the new world continued more refractory. A special commission, which was issued for trying American delinquents in England, did not pass without a vehement, but unsuccessful opposition, on constitutional grounds.

For more than two years the subject of the Middlesex election engaged and agitated the public mind. In parliament, the eloquence of Chatham and of Camden were exerted in vain, to obtain a reversal of its proceedings. Lord Chatham declared, that the people had no confidence in the existing parliament, and proposed petitioning his majesty to dissolve it. On this, lord Camden having divided with the opposition, he was immediately deprived of the great seal. The dismissal of lord Camden was speedily followed by the resignation of the duke of Grafton, who, though far from joining the standard of opposition as a decided partizan, had, on one occasion, voted in support of lord Rockingham's motion against his majesty's secret advisers. The duke of Grafton's place, as first commissioner of the treasury, was immediately filled by lord North, who had been for two years chancellor of the exchequer. Thus was unfortunately formed an administration, which exercised the powers of government for 12 successive years; and, by its vindictive spirit, and its obstinacy in error, shook the British empire to its foundation.

During this year a part of Mr Townsend's stamp act was repealed; but that part of it which regarded the imposition on tea was continued; and unfortunately the spirit of the act still remained. In vain was it urged, that the repeal of our most obnoxious impositions had produced all the happiest effects predicted by the advocates for that repeal; that lenity on our part had produced moderation on the part of America; and that the recent discontents had arisen from fresh provocations.

Wearied at last with fruitless contest against the ministry, the nation seemed prepared to fix its regard on any new object of political interest which should pre-

VOL. IV. PART II.

sent itself. In the year 1764, lord Egmont being then at the head of the admiralty, a settlement had been projected on the Malouine or Falkland Islands, and commodore Byron was sent out to take possession of them. It happened that, about the same time, a settlement had been made, and a fortress erected, by the French navigator M. Bougainville, on one of these islands to the east of the English settlement, under the name of St Louis. But, in consequence of the representations of the court of Madrid to the court of Versailles, this was soon yielded up to the Spaniards, who gave it the name of Port Soledad. It was well known, that (Brazil and Surinam excepted) Spain pretended to the absolute sovereignty of the whole southern continent of America, and the islands belonging to it. The English settlement, therefore, excited at the court of Madrid the highest alarm and uneasiness, not merely as an encroachment on the right of dominion, but because it was evident, that the principal inducement of England to form this settlement, was the facility which it would give to an attack upon the Spanish territories bordering on the great South Seas. Spain remonstrated without effect, and, dreading the power of England, might have probably submitted to the aggression, had not the loss of reputation sustained by England, from her tame acquiescence in the cession of Corsica to France, emboldened the court of Madrid to second her remonstrance by vigorous preparations. Towards the close of the year 1769, captain Hunt of the Tamer frigate, cruising off the islands, fell in with a Spanish schooner belonging to Port Soledad, and commanded the Spaniard to leave the coast. The captain of the schooner obeyed; but returned with a letter from the governor of Buenos Ayres, warning captain Hunt, in his turn, to quit the Malouine coast. After some altercation, captain Hunt returned to England, leaving only two small sloops at Port Egmont. In a short time, a large Spanish armament appeared before the British settlement, and summoned it to surrender;—a summons which captain Farmer, the commandant, readily obeyed, as resistance would have been unavailing. By the terms of capitulation, he was allowed to return to England; but by an unparalleled insult to the British flag, he was detained by the Spaniard for twenty days. The news of this transaction excited a violent indignation in England; and had the warlike spirit of lord Chatham still guided the national councils, the discussion of the right to these islands would have been preceded by actual retaliation on the part of Britain; but the conciliatory temper which we refused to our colonies, was on this occasion extended to enemies. A negotiation took place. The Spaniards restored the islands; but it was privately stipulated, that they should be afterwards evacuated by Great Britain; and since that time, no settlement has been made upon them. Upon the whole, setting aside the affront offered to our flag, the grounds of the quarrel do not seem to have justified a war. And though the pretensions of Spain to the whole empire of South America may seem ridiculous, let us ask if the pride of Britain would not have been alarmed, had Spain attempted to form a settlement, or to establish a garrison, in any part of the dismal wilds of Labrador, or the frozen regions of Hudson's Bay.

The year 1771 was distinguished by an extension of the liberty of the press, in a point of vital interest to public freedom. Before this period, the publishers of the debates in parliament encroaching, they knew not

precisely on what grounds, had given the speeches either under fictitious names, or merely with the initials of those of the speakers. By degrees, however, the papers began to assume more liberty; and some of them, by that incorrectness of reporters which can never be avoided, grossly misrepresented many of the speeches. A member of the House of Commons complained, that he had been thus injuriously treated, and the house took up his cause with great warmth. They ordered the printers to attend the house. The printers conceiving that they were not bound by law to obey, refused obedience; and the serjeant at arms, who was sent to arrest them, was treated with contempt. On this, the house addressed his majesty to issue a proclamation, by virtue of which they were apprehended, but immediately dismissed by the magistrates; one of them by Mr Wilkes (at that time alderman of London), a second by alderman Oliver, and a third by Mr Crosby, the lord mayor. The magistrates were applauded by the populace, and publicly thanked by the citizens in common-council. The commons in indignation committed Mr Wilkes and the lord mayor, both members of their own house, to the Tower. They were brought up, indeed, by habeas corpus, and their case was brought before the Court of Common Pleas; but after long and learned pleadings, these magistrates were remanded by the court, and their liberation was celebrated with universal rejoicings. The house, or, more properly speaking, its leaders, the ministers, were peculiarly perplexed with Mr Wilkes. He had been ordered to attend at the bar of the house; but, in return, he pleaded his privilege as a member, refusing to obey the summons in any other character. It was now that the commons discovered themselves in a dilemma, from which they chose to make a ridiculous retreat in preference to persevering. They ordered Mr Wilkes to appear on the 8th of April, but adjourned to the 9th. In consequence of this implied victory on the part of reporters, they have since exercised a privilege important to the political knowledge of the community, although they are still amenable to parliament for wilful misrepresentation. During the recess of parliament, in the summer of the same year, some official changes took place in the administration, in consequence of the death of the earl of Halifax, a nobleman, generous and accomplished; but as a minister, unpopular and unfortunate. He professed the principles of the Whigs, but acquiesced, for the sake of ambition, in the Tory measures, which predominated in the present period; yet he had filled the lieutenancy of Ireland with ability and applause. The earl of Suffolk succeeded him as secretary of state for the northern department, and the duke of Grafton accepted the vacant post of lord privy seal.

For some succeeding years, the administration of lord North was marked by few events of signal consequence. An application was made by a considerable body of the established clergy, and by a number of the laity in those professions, which required subscription to the thirty-nine articles, for relief from that severe test of faith. The bill for granting this relief was carried through the commons, but was rejected by the lords. The same fate attended a motion in favour of the dissenters, for a farther enlargement of the toleration act, which was successfully made in the lower house by sir George Saville. In consequence of the marriage of the dukes of Cumberland and Gloucester to women of inferior rank, the royal marriage act was about the same

time passed. By this law, the descendants of George II. were, with a few exceptions, prohibited from marrying without the royal consent. The bill was not passed without encountering a spirited opposition. The descendants of George II., it was observed, might in time comprehend a vast multitude of individuals; and the right of government itself, to prevent an indefinite number of human beings from enjoying the common privilege of nature in contracting marriage, was reasonably called in question.

The affairs of the East India company occupied much of the attention of parliament at this period; and a new regulating bill was past for reforming the government of India, by great parliamentary majorities, and with the general concurrence of the nation. For the particulars of these changes, we must refer our readers to a future article. We shall only notice at present, that while the vigour of these regulations was apparent, experience could only prove their deficiency in wisdom. This may be considered as the most brilliant era of lord North's administration; but, while the nation was enjoying and looking forward to tranquillity, a tempest was gathering abroad.

The affairs of India had scarcely been discussed, when it was necessary to turn a serious attention to those of America. The unfortunate disputes with our colonies, revived by the imposition of the port-duties in 1767, had suffered no abatement, though kept out of view by domestic bickerings of infinitely less importance. The non-importation agreement entered into by the colonies had already been noticed; but though the Americans confined their practical opposition to commercial combinations, they began to indulge a boundless licence of speculative discussion, on the nature and extent of parliamentary power. Nor was the tax upon tea the only cause of disaffection. The dependence of the governors and judges in America had been transferred from the people to the crown. In the act, which imposed the port-duties in 1767, was a remarkable clause, which gave scarcely less umbrage and alarm than the taxes themselves,—a clause empowering the crown, by sign manual, to establish a general civil list throughout every province in America, with any salaries, places, or appointments, to the very last shilling of the American revenue. In 1768, the assembly of Massachusetts-bay had called upon the different colonial legislatures to join with them in petitioning the king respecting the grievances of America. In spite of all the instructions of lord Hillsborough (secretary for foreign affairs) to the governors of the provinces, their respective assemblies concurred with the proposal of the Bostonians; and a committee of correspondence was framed among them, and a general spirit of union appeared to pervade America. The first tumults arose at Boston, where the populace rose on the commissioners for levying the taxes, and compelled them to take refuge at a fortress near the town. In consequence of this riot, troops were landed to overawe the citizens, under cover of fourteen ships of war; while the assembly of the province openly directed the inhabitants to hold themselves provided with arms. This was the provocation which, in the ensuing year, the British parliament thought a sufficient justification for reviving an obsolete and tyrannical statute of Henry VIII. for bringing persons accused of treason beyond seas to trial and punishment in England. The measure excited, throughout all America, a just and terrible alarm. In such a state of mind, the Americans

looked back on the late concessions of the mother country with suspicion; and their suspicions had but too palpable grounds to lay hold of, when they saw that, by maintaining the right of taxation in a single case, they retained the principle, and founded a precedent for its indefinite application. The residence of the military at Boston, far from quieting, only enflamed the populace. In 1770 an affray took place, in which the military were constrained to fire upon the rioters, and several lives were lost.

During the session of the Massachusetts' assembly in the summer of 1773, a discovery was made, which added fresh fuel to the flame, long since kindled in that province. The celebrated Dr Franklin, agent of the House of Representatives in England, had acquired possession of certain letters, written in confidence by Governor Hutchinson and others to their friends in England, in which they spoke of *coercive measures*; of taking of *incendiaries*; and of *altering charters*, with the utmost freedom. Franklin immediately transmitted these letters to his constituents. They excited excessive indignation, and produced a petition from the Massachusetts' assembly to the king, to remove their governor. The petition was transmitted to Dr Franklin, presented to the king, and by his majesty laid before the privy council. Dr Franklin was summoned to support the petition before the same meeting, where he received from the lord chancellor Loughborough the grossest abuse. He was pronounced a forger of the letters; and the Massachusetts' petition was rejected as scandalous and seditious.

The duty of tea, as we have already remarked, had been left as a token of legislative supremacy. The East India company, reduced almost to bankruptcy by the accumulation of their teas, were urgent with the minister to repeal the American duty of 3d. a pound, offering in lieu of it, to pay double the sum on exportation. At length, in 1773, an act passed for permitting the exportation of teas duty free. The East India company hoped, by this measure, to regain the American market, and the government still exulted in upholding the principle of taxation, since the company, instead of America, had paid the duty; but in this they were both disappointed. When the tea was attempted to be landed, the mob arose in Boston harbour, boarded the ships, and threw their cargoes into the sea, retiring peaceably afterwards, without giving or receiving any personal violence. Other places followed the example, and in no places was the delivery of the tea to its consignees permitted by the Americans. Such resistance could not long be concealed, and it reached England, heightened by many exaggerations. The tidings were communicated by the minister to parliament, at their next session, and a plan of coercion and punishment destined to be tried in America, was received and voted with almost universal enthusiasm. A remonstrance, indeed, was presented by the Americans resident in London, concluding with a bold avowal, that the attachment of America could not survive the justice of Great Britain; and the voice of the minority was also raised, though ineffectually, to advise conciliation. A bill for removing the custom-house and seat of government from Boston to Salem, and another for depriving the Massachusetts state of its charter, were passed during the session, the former without a division, the latter by a great majority. Lord Chatham, at this early stage of the dispute, declared his unalterable opinion, that Britain had no right to tax

America. "As an Englishman, (said that venerable statesman,) I recognize to the Americans their supreme unalterable right of property. As an American, I would equally recognize to England her supreme right of regulating commerce and navigation. This distinction is involved in the abstract nature of things. Property is private, individual, absolute—the touch of another annihilates it. Trade is an extended and complicated consideration—it reaches as far as ships can sail or winds can blow; it is a vast and various machine, which requires the superintending candour and energy of the supreme power of the empire. Taxation is theirs, commercial regulation is ours." But the language of the lords in administration was high and decisive; it was declared that the mother country should never relax till America acknowledged the supremacy of Britain. The Americans, on the other hand, as soon as they heard of the bill for shutting up the harbour of Boston, for abolishing the charter of Massachusetts, for quartering troops in America, and for other coercive measures that were in preparation, testified a determined spirit of resistance. Yet this determination, though firmly, seemed not to be willingly adopted; so many of them were connected with Britain by commercial ties, that the prospect of a civil war presented the most terrific ideas.

When general Gage arrived with fresh forces at Boston, they addressed him in strong, but respectful terms; and declared that they were ready to promote a reconciliation on any terms consistent with their rights as British subjects. Their remonstrance was, however, disregarded. A general congress of deputies from all the states was now loudly demanded by the Americans; and, in the mean time, the committee of correspondence at Boston, bound themselves by a solemn agreement, to suspend all commercial correspondence with Britain. It was in vain that general Gage protested against these proceedings. The congress of deputies was appointed to be held at Philadelphia, and the American magistrates informed the several governors, that their power was no more. The congress consisted of 51 delegates, and commenced with an address to the governor-general, in which they set at defiance his endeavours to overawe their proceedings. His authority was in fact gone; he could not even procure the lowest mechanics to erect barracks for his soldiers. The resolutions of the congress, on the other hand, had all the validity of laws. They proceeded to draw up a petition to his majesty, a memorial to the people of Great Britain, and an address to the colonies in general. Having finished these addresses, they adjourned, after a session of 52 days.

A new British parliament assembled towards the end of 1774; but the discussion of American affairs was at first studiously avoided by the ministry. When the subject was opened, their language was still expressive of contempt for the rising spirit in the colonies; and it was even intimated, that the apprehensions of a war were wholly chimerical. The estimates were formed entirely upon a peace establishment; the army remained on its former footing; and, what was most of all surprising, a reduction of 4000 seamen took place from the 20,000 voted in the last year, lord Sandwich, first lord of the admiralty, declaring, that he knew the low establishment proposed would be fully sufficient for reducing the colonies to obedience. The petition from the congress to the king, having been referred by his

majesty to the House of Commons, the American agents, Dr Franklin, Mr Bollan, and Mr Lee, petitioned the house to be heard at the bar, in its support. But the ministers alleged, that the congress was no legal body, and refused to give them a hearing. A similar fate in the upper house attended lord Chatham's bill for settling the troubles in America; and the very day after the rejection, a motion was made by lord North, to declare America in a state of rebellion. On this momentous occasion, the strength of that party which had combated the hostile system towards the colonies, was considerably increased; they divided on this occasion, 106 against 288. They were joined by the rising talents of Charles Fox, who had lately been dismissed from the treasury bench, for displaying a spirit not sufficiently submissive. Though the feelings of the British nation were at this period torpid or undecided with respect to America; yet the triumphs of administration, in rejecting all the plans of conciliation proposed by lord Chatham, Mr Burke, and the other leaders of opposition, were not undisturbed by many remonstrances from important bodies in the nation. The city of London remonstrated; the West India merchants and planters petitioned against measures, which threatened to involve them in ruin. The declaration of America being in a state of rebellion was, however, immediately followed up by a bill for restraining the trade and commerce of Massachusetts-Bay and New Hampshire, the colonies of Connecticut and Rhode Island, and Providence Plantations, in North America, with the British and West India islands; and to prohibit their fisheries on the banks of Newfoundland. After so strong a measure, some surprise was excited, when lord North advanced a conciliatory motion, of which the purport was, that when the Americans should propose to make such provisions for the support of their civil government as should be approved of by his majesty and the parliament, the British government would abstain from taxing them, and confine themselves to their commercial regulations. Some of the zealots of the minister's friends, expressed alarm at the extent of this concession; while the friends of America justly derided it as nugatory, since it was the *right*, and not the mode of taxation which the colonies disputed.

In the mean time, the military preparations, on the side of the Americans, had proceeded with ardour. The cannon and stores, belonging to government, were seized by the provincials, in Rhode Island and other places; as, on the other hand, general Gage had seized a number of warlike stores, deposited in the vicinity of Boston. Having received intelligence of a considerable magazine deposited in the vicinity of Boston, the British commander detached, on the night preceding the 19th of April, 800 grenadiers and light infantry, under colonel Smith, who proceeded in their march with great silence; but by the firing of guns and ringing of bells, they at length perceived themselves discovered; and, on their arrival at Lexington, at five in the morning, they found

a company of militia drawn up on the green. With these men, the advanced guard of the king's troops exchanged fire, and the Americans, after losing a few men, retreated. After which, the royalists proceeded to Concord, and destroyed the stores. On their return, the passage of a bridge being disputed by the provincials, a skirmish ensued, with the loss of a few men on both sides: the people rose in all quarters, and by a scattered but destructive fire, from behind trees and hedges, they made the British suffer considerably. A second body of troops, which general Gage had the prudence to send to Lexington, secured their retreat, and they returned to Boston about sunset, after losing 300 men, while the loss of the provincials did not exceed 90. Within a few days after the first blood had been drawn at Lexington, the provincial congress of Massachusetts voted a large army to be raised; and so great a military force was immediately collected in the neighbourhood of Boston, as to form a complete blockade of that important town.

Such was the inauspicious commencement of the civil war. In the month of May, the American Congress, now joined by the colonies of New York and North Carolina, unanimously rejected Lord North's conciliatory proposition: it laid a basis too narrow, indeed, for a solid reconciliation, and its reception might have been foreseen. At the latter end of the same month, the British Generals Howe, Burgoyne, and Clinton, arrived at Boston with a large reinforcement of troops, so that the force now assembled in that place, or its vicinity, amounted to no less than 10,000 men. Martial law was proclaimed; but a shew of conciliation was still held out by the offer of General Gage, in the king's name, to grant a general amnesty to such as should lay down their arms, excepting only two distinguished Americans, Samuel Adams and John Hancock. The congress took no other notice of this proclamation, than to elect Mr Hancock the president of their assembly.* They chose, at the same time, George Washington the commander in chief of their army.

The British generals, weary of their confined situation, and affected by the disgrace of being blockaded, had determined to get possession of the heights of Dorchester, near the town of Boston, when they were surprised to see entrenchments thrown up by the Americans in an opposite quarter, on an eminence called Bunker's Hill. This post General Howe attacked in person with 3000 chosen troops, and, at last, drove the Provincials from their entrenchments; but this was a slight advantage, and dearly purchased, by the loss of 1100 of the British, who fell in storming the works; while the Americans retreated across an isthmus, to a new position, with inconsiderable damage, and still continued the blockade of Boston. Elated and exasperated as the provincials were by this fresh bloodshed, and by a battle which, though nominally a defeat on their side, yet gave a signal proof of their abilities in war, the congress sent a second petition to the king for peace, and accommo-

* By the act of confederation passed in the assembly this year, the provinces are denominated, "The Colonies of America United" for their common defence, for the security of their liberties and property, and for their mutual and general safety and welfare. The act ascertained the power of congress, and prescribed their mode of action; the confederation was declared to be established until the terms of reconciliation proposed in the petition of congress to the king should be agreed to; the obnoxious acts repealed; reparations for the injuries done to Boston and Charlestown (a suburb of Boston, burnt amidst the first hostilities); and till the British troops should be withdrawn from America. On these events taking place, the colonies were to return to their former connections and friendship with Great Britain; but, in failure of that, the confederation was to be perpetual.

dation and reunion with Britain. Mr Penn, who delivered the petition, was informed, that no answer would be given to it.

Nor was the spirit of the Americans confined to defensive operations. As it was known that Canada had determined to be neutral, and that her militia had refused to obey General Carleton's orders to march beyond their own limits, they determined to carry the war into that province. General Montgomery, with 3000 men, proceeded along the lake Champlain; and having, with great gallantry, carried the forts of St John and Chamblee, pressed forward to Montreal. Meanwhile an irregular band of the green-mountain men, under Colonel Allen, seized Ticonderoga; and General Arnold, by a march of incredible hardihood and activity, reached the southern bank of St Lawrence, where he awaited Montgomery. The latter joined him on the 1st of December, and commenced the siege of Quebec, which contained a garrison of 1600 men. By a novelty in military science, arising from the dreadful rigour of the climate, Montgomery's batteries were composed of snow and water, which soon consolidated into ice. But his artillery making only a slight impression, he determined on attempting the place by assault, and attacked the town in different quarters. Montgomery fell in this bold assault, within 50 yards of the walls of Quebec. The attempt completely failed, and a whole division of the Americans were made prisoners. It reflected, however, no small credit on the surviving General Arnold, that, wounded and repulsed as he was, he still continued the blockade of the place, and reduced it to great distress.

In Virginia, after many disputes with the people, the governor, Lord Dunmore, at last took refuge on board a ship of war which lay off York town. He proclaimed martial law, and invited the negroes to arrest their owners, and join the royal standard; a measure which produced but few opportunities of emancipation to the slaves, and much more irritation than damage to the enemy. A more serious blow was inflicted on the town of Norfolk, which, for refusing to supply the shipping in the Chesapeake with provisions, was cannonaded, and laid in ashes in the space of a few hours. Governor Eden, with admirable moderation, for some time averted the last extremities of the contending parties in Maryland: he retired from his government with universal esteem. In the Carolinas, Lord W. Campbell and Governor Martin, adopting the policy of Lord Dunmore, fled, like him, to the ships in their harbours. In Pennsylvania a military association was formed, and the whole chain of colonies was now in arms.

Application was made by the British government, to obtain the alliance of the native Indians against the colonists. Some of these rude tribes, with an affecting and simple eloquence, which might have taught wisdom to those who boasted of more humanity, exhorted the brethren of the old and new world, to bring their unnatural quarrel to an end. But others of them, bordering on the great lakes and rivers, were prevailed upon by the presents and solicitations of Colonel Johnson, to take up the hatchet; and, at a great war feast, they were invited by that officer, in their own dreadful phraseology, to banquet on the blood of a Bostonian. In contemplating the inhumanity of having recourse to such aid, it is but a small consolation to think, that it was wholly inefficient to promote the arbitrary measures of a misguided government. However contemptible as a general in-

strument of war, it produced abundance of misery in detail.

Parliament met, after a short recess, on the 26th of October 1775. From the speech from the throne, it was evident, that peace would not yet be offered to America, but at the price of her unconditional submission. During the summer recess, the Duke of Grafton, who had for some time viewed the hopeless state of the American quarrel, and the violence of his associates in the cabinet with extreme regret, had made an effort to procure a change of system; and, on the receipt of a second petition from congress, renewed his solicitations, but without effect. On this his grace made a second resignation; and some other changes took place in the cabinet, which left the management of affairs more embarrassed than ever, by the suggestions of those who hesitated in the system of overawing America. In both houses, however, a strenuous opposition was raised to the present measures. "We have beheld (said the Marquis of Rockingham, and the minority lords, in a spirited protest which they entered on the journals of the peers), we have beheld, with sorrow and indignation, freemen driven to resistance by acts of oppression and violence; and we cannot consent to deceive his majesty and the public into a belief of the confidence of this house in the present ministry, who have lost the colonies, and involved us in a civil war against our clearest interests, and upon the most unjustifiable grounds."

On the 10th of November, the Duke of Richmond obtained a reluctant vote of the peers, to examine Mr Penn, who had brought the petition from congress, emphatically styled by the framers of it, the *olive branch*. The colonies, Mr Penn affirmed, would still allow the imperial authority of Britain, though not its right of taxation; that the rejection of the present offer would certainly prove an insuperable bar to reconciliation; but the prevailing wish in America still was, restoration of friendship with Britain.

In the commons, Mr Burke's bill for quieting the troubles in America, and Mr Fox's motion of enquiry into the ill success of our arms in the same quarter, produced the strongest admiration of the speakers, but no change of resolution in the house. Large supplies were voted, and the land-tax was raised to four shillings in the pound. On this occasion, the country gentlemen, while they smarted under the taunts and sarcasms of the opposition at the *first fruits* of their American war, were alarmed by a declaration of the minister, that the contest with the colonies, was not now for taxes, but for sovereignty. With difficulty did the minister soften them by the assurance, that the project of taxing America would not be given up. Supplies were also voted for the payment of 18,000 mercenaries, the troops of the Landgrave of Hesse, and the Duke of Brunswick, who were to be brought, at the expence of many millions, to effect the reduction of the new world. By a bill, introduced soon after the meeting of parliament, all trade and intercourse was prohibited with the revolted colonies; and their property, whether ships or goods, were declared to be forfeited, to the ships or crews who might be their captors.

To return to the state of the war in America, we find the blockade of Quebec continued by Arnold, and afterwards by Sullivan, with surprising perseverance, in spite of the disastrous issue of Montgomery's attempt. Early in the spring of 1776, a naval armament from Britain forced their passage through the river St Lawrence; and General Carleton, animated by the rein-

forcement, pursued the Americans, who, before his arrival, broke up their camp, weakened by disease and hardship. The Americans were driven, post after post, from all that they had gained in their northern irruption except from Lake Champlain, and exertions were made by the Generals Carleton and Burgoyne, to obtain a superiority there also, by constructing a greater number of vessels.

The garrison of Boston, which was maintained at an incredible expence by supplies from England, continued to be closely blockaded during the winter of 1775-6. In the month of March 1776, General Washington, by a masterly stroke, compelled the British to abandon it. Passing in profound silence, with 2000 men, the neck of land which separates Dorchester heights from the town, he constructed, in a single night, a redoubt, which gave him command of the heights, and menaced the British shipping with destruction. A storm of wind and rain prevented General Howe from attempting to dislodge him, but did not impede the industry of the Americans in strengthening their works, till they were too secure to be carried by a *coup-de-main*. Another work being thrown up by the enemy, which, from its proximity, had the entire command of Boston Neck, the British commanders had no choice but to evacuate the town. The whole troops, and such of the loyalists as chose to follow their fortunes, were accordingly embarked, and sailed for Halifax. Washington, on the succeeding day, entered Boston in triumph.

The defence of Sullivan's island, near Charleston, the capital of South Carolina, also gave spirit and reputation to the American cause. In the month of June, the fleet under Sir Peter Parker, having on board a considerable land force, commanded by General Clinton, anchored off Charleston-bar. Two ships, the Bristol and Experiment, each of 50 guns, having with difficulty passed the bar, proceeded to cannonade the fort of Sullivan's island, which defended the approach to the town; but, after sustaining a dreadful fire from the American batteries, they slit their cables at night, and retired, almost torn to the water's edge; and the Actæon, of 28 guns, having run ashore, was obliged to be set on fire and abandoned. The attempt on Charleston was necessarily abandoned, and Sir Peter Parker set sail for New York. Indeed, the number of the native troops, which had assembled from all parts of the province for the defence of their capital, under the command of an experienced and spirited officer, General Lee, together with the specimen of their resistance already exhibited, gave but slender hopes of success in pushing on the enterprize. According to Mr Penn's prediction, the refusal of the "olive branch" was followed by a general determination of the Americans for independence. It might have been indeed foreseen, that whatever sentiments pervaded the colonies before the rejection of this petition, this event could not but operate, both as a cause of new alienation, and a pretext for declaring what had been formerly concealed. It was not to be looked for, that the leaders of a revolution should step down from the rank of champions and rulers, to that of subjects and suppliants: it was not possible, that, while the war was every day adding thousands of individuals to those already pronounced traitors by the laws of England, ideas of peace or submission should become prevalent. Those provinces, accordingly, which had been the most

backward in declaring for independence, North Carolina, Pennsylvania, (and Maryland, the most reluctant of all,) at last concurred in the confederation. The delegates of the thirteen United States being now unanimous, solemnly promulgated their declaration of *Independence* on the 4th of July 1776. Appealing to the Supreme Judge of the world for the rectitude of their motives, they absolved in the name of their countrymen, all their allegiance to the crown of Britain, and political connection with the British state. However justified by general views, and by the event itself, Lord Chatham's prediction, that we could not conquer America, might be, the boldness of the Congress in declaring their independence, formed a striking contrast to the present dangers of their situation. General Washington's head quarters after the capture of Boston, were fixed at New York; and both this place and Long Island were put into the best posture of defence that could be prepared against an enemy now double in number to the continental army.* The British army in this quarter consisted of nearly 30,000 men, amply provided. General Howe arrived, about the end of June, off Sandy Hook, with the troops which he had removed from Boston, and was joined by his brother, Lord Howe, at the head of the fleet, and with reinforcements. The Howes were popular in America; and they were chosen with a shew of pacific policy, to carry out offers of peace, together with the terrors of the British arms. But their commission was never shewn to the Americans, if we may trust the declaration of Washington, to contain any terms worth listening to; and their proclamation, which offered pardon to the colonists in arms, was emphatically answered by the same commander in a few words, that, having taken arms to defend their indisputable rights, they were conscious of no guilt, and wanted no pardon.

Both sides prepared seriously for action. On the 26th of August, the whole British army being reembarked, landed on the south-western extremity of Long Island; on the opposite side of which, in view of the island and city of New York, was stationed a large body of the Americans under General Sullivan. An engagement took place, in which the Americans were driven back to their lines at Brooklyn, their commander Sullivan taken prisoner, and 1000 of their men killed or captured. The British troops, whose ardour to storm the enemy's lines could scarcely be restrained, broke ground at 600 yards distance from the nearest redoubt, and the ships in the bay waited only for a fair wind to enter the east river, and thus completely cut off the Americans from all retreat to the continent. In this situation, the genius of Washington enabled him to make an admirable retreat. He effected it on the succeeding night, under cover of a thick fog, with such silence, order, and secrecy, that a British army, only a quarter of a mile distant, knew nothing of it till the last boats of the Americans were seen passing the river, out of reach of the batteries. General Howe, next morning, took possession of the deserted works of Brooklyn, the only fruits of his victory. An interview took place, at the desire of Lord Howe, after this affair, between his lordship and some members of the congress, (Franklin, Adams, and Rutledge,) upon Staten Island. The British commander, though he promised that the authority of congress should be subsequently acknowledged, to substantiate an accommodation if it should be made, declared

* The American army, at this time, in and near New York, did not exceed 18,000 men.

that he could only receive the gentlemen of congress as individuals, not as members of a legal body : but it was wholly unnecessary to institute any such distinction ; for the American deputies declared, that his lordship's commission contained no new authority, and that his power of inquiring into the situation of America, held out no distinct advantage that could induce the colonies either to treat or to disarm.

Having taken possession of New York island and of the city, with little opposition, General Howe endeavoured to bring his antagonist to a general action : a crisis which Washington had sufficient sagacity and choice of positions to succeed in avoiding. From the environs of New York the American commander retreated to Kingsbridge, and from thence to a new and strong position on the White Plains, with the deep river Bruin in his front, and the North River behind his rear. Here the incessant rains of October prevented Howe from attacking him, or discouraged the dilatory disposition of the British general, till he withdrew to the high woody lands bordering on North Castle district. Howe, thus despairing of bringing him to a general engagement, determined to attack Fort Mifflin, a strong post which the Americans still retained on the North River. It was carried by assault, and 2700 men were made prisoners. Fort Mifflin, on the opposite or Jersey side of the same river, was soon after abandoned to General Cornwallis without a struggle. Washington, with diminished numbers, continued his retreat before the van of Lord Cornwallis, to Brunswick, and from thence to Princetown. On the 8th of December Lord Cornwallis reached the banks of the Delaware, just as the rear guard of the Americans gained the opposite shore ; but a cessation of the pursuit became indispensable for want of boats. Washington at this period trembled for the fate of America, and talked of retiring to the recesses of the Alleghany mountains ; but the British troops, in the full career of success, were ordered into winter cantonments. Amidst these successes, Rhode Island was seized by the British ; and General Lee, an active American commander, whose talents were equal in value to a province or a fortress, was taken prisoner at Baskinridge. Nothing could seem, indeed, more forlorn than the aspect of American affairs at this period, to those who forgot, that it was still more difficult for Britain to retain than to make those conquests, painfully as they had been made.

That the spirit of freedom had not been subdued in the new commonwealth, appeared from the acts of their congress. Though obliged to retreat from the seat of war into Baltimore, they adopted the most vigorous measures : They voted an army of 88 battalions, and gave enlarged, almost dictatorial, powers for six months to their chief general. Far from lowering their tone to Britain, or meeting her indefinite proposals of revising the acts of parliament obnoxious to the colonies, they sent Franklin, and other commissioners to treat for alliance and assistance at the court of Versailles.

The intelligence of the successes of our arms on Long Island and at New York reached England before the meeting of parliament in October 1776, and gave scope to the most boastful predictions of those who anticipated a forcible subjugation of the colonies. By the minority a different use of these advantages was recommended ; and the ministry were exhorted rather to concede, while they could with dignity, such terms as would conciliate the vanquished, than drive them to despair.

A moment of success, however, was as inauspicious for the arguments of the minority to prevail, as for the claims of America to be admitted. The motions of the Rockingham party being uniformly rejected, the most of its members absented themselves from parliament, and supplies for the future campaign were voted with scarcely the shew of a debate. The members of the secession justified their conduct by declaring, that it was too degrading to be the ineffectual instruments of resisting a system supported by majorities and not by reason, and that they would reserve their exertions for a season, when the national delirium had so far subsided as to afford some hope of advantage. Their secession, however, was but of short duration : they returned soon after the recess, and with a success to which they had been little accustomed, obliged the minister to limit the suspension of the *Habeas Corpus* act to America, by altering the contents of a suspending bill ; a bill which was originally framed with such latitude, that it would have equally subverted the rights of the subject within and without the realm. A vehement contest arose towards the close of the session, when the debts of the civil list, amounting to 600,000*l.* were submitted to the house, and a claim for that sum, and 100,000*l.* per annum, made upon the generosity of parliament. The minister prevailed in this motion ; but when the speaker, Sir Fletcher Norton, addressed the king on presenting the bill, he conveyed a bold and free advice to his majesty in the name of the house, stating their expectations, that what had been liberally granted would be wisely applied. The zealous friends of loyalty, fired with indignation at this freedom, contended, that the speaker had not conveyed the sense of parliament. At Mr Fox's instance, the question was put, (in defiance of this charge,) whether the speaker had spoken the sense of his constituents or not : and here, once more, the minority had a short triumph ; for the house, though they would never have voted such an address, chose to support the dignity of their speaker ; and a vote of thanks was carried to Sir Fletcher Norton.

The health of the venerable Earl of Chatham had for some time prevented him from giving public testimony to his abhorrence of the war ; but at the risk of his life, he attended the House of Peers on the 30th of May, wrapt in flannels, and supported by a crutch in each hand. He made a motion for addressing the throne to put a stop to the unnatural contest, by redressing all the grievances of the colonies, and by putting America exactly as she stood before 1763. The justice of unconditional redress he supported on the grounds of Britain having been the unqualified aggressor in the dispute. The policy of such redress, he deduced from the impossibility of conquering the colonies, and from the immediate prospect of France interfering. "You cannot," said he, "my lords, conquer the colonies. I may as well pretend to drive them before me with this crutch. I am experienced in spring hopes and vernal promises, but at last will come your equinoctial disappointments. If it be true, as ministers say, that no engagements are yet entered into between America and France, there is yet a moment left ; the point of honour is still safe ; a few weeks may decide our fate as a nation." The peers in administration repeated their arguments against concession of any kind, and denied any danger from France. The *pacific motion*, as usual, was lost. During the session, a memorial was delivered by Sir Joseph Yorke, ambassador at the Hague, to the States General, complain-

ing of the seizure of an English vessel, by an American pirate, within cannon shot of the Dutch island of St Eustatia, and of a salute given by the fortress to a rebel flag. The memorial was couched in haughty and pe-re-mptory language, and denounced immediate vengeance if satisfaction should be denied. The Dutch, though they declined giving an answer to our ambassador, and complained, through their resident in London, of the tone of menace which pervaded his majesty's memorial, disowned the conduct of the governor of St Eustatia, and recalled him; but the utmost coolness from this time subsisted between the courts of London and the Hague.

The gloomy state of American affairs, as they appeared at the close of the former year, was gradually retrieved by Washington, after his retreat behind the Delaware. Perceiving the cantonments of the British widely extended, "Now is the time," said that sagacious general, "to clip their wings, while they are so spread." On the morning of the 26th of December 1776, he crossed the Delaware above Trenton, and marching with his whole force, not exceeding 3000 men, in the midst of a storm of hail and snow, he surprised three regiments of Hessians, and made them prisoners. In the evening he repassed the Delaware, and having entered Philadelphia in triumph, took possession of Trenton. Here he was menaced by the advance of the British from Princetown; but in the dead of the night, (January 2d, 1777,) he silently withdrew his troops, leaving fires burning in his camp, to deceive the enemy, and reaching Princetown by a circuitous route, surprised a brigade of British infantry, (17th, 40th, and 55th regiments,) whom he repulsed with considerable loss. Lord Cornwallis retreated precipitately to Brunswick, and the fortune of the war seeming to turn, the militia throughout the Jerseys, encouraged, by recent success, and enraged at the oppression of the soldiery, rose by general consent, and regained possession of the most important quarters. The early part of the campaign of 1777 was marked by no events of more importance than the mutual destruction of stores and magazines. At Courtland Manor, and at Danbury, the British detachments were successful in these objects; and at Saggs harbour in Long Island, the enemy made severe retaliation. After a long delay, General Howe entered the Jerseys in full force, in the month of June, and endeavoured, by every feint that he could practise, to bring Washington to action. But he found it impossible to entangle the American Fabius. Washington, indeed, once advanced as Howe retreated; and, leaving his strong camp at Middlebrooke, came forward to Quibbletown, to be near his enemies for the sake of observation: but when the British returned to the charge, he fell back immediately to the former strong position; and Lord Cornwallis, who had come round by the right, in hopes of surprising him, found the passes of the mountains fortified, and was obliged to retire. Howe, in despair, once more abandoned the Jerseys, making his retreat with havock and ruin, and fully acquitting himself of any suspicion of partiality to the enemy. Another project was yet to be tried. On the 23d of July, the whole army was embarked, leaving only a small force behind at New York, and was brought round, after a tedious voyage, to the head of Chesapeake Bay. Washington, contrary to his usual policy, chose to hazard a battle, and to dispute the passage of the river Brandywine, which lay in the intended route of the British towards Philadelphia. The action was favourable to the British;

but the approach of night prevented them from pursuing its advantage. Thirteen hundred of the Americans were killed, wounded, or taken; among the wounded was the young Marquis de la Fayette, who had recently entered as a volunteer in the service of the commonwealth. In consequence of this victory, General Howe entered Philadelphia, and passed the Schuylkill without opposition. The American general, at the distance of sixteen miles, held a strong position on the same river, and keeping a watchful eye on the enemy, thought he could surprise them by a nightly march to Germantown. At this place he risked another battle on the 3d of October; he failed in the attack, but the British sustained a loss of 500 men. Philadelphia was now in our hands; but the possession of it was rather dangerous than advantageous, without the command of the river Delaware; and the navigation of that river was impeded, both by machines which the Americans had sunk, and by a fort at the junction of the Schuylkill and Delaware, called Redbank, which a body of Hessians, in endeavouring to storm, were repulsed with great slaughter. As Lord Howe, however, had come round with the fleet, in order to act in conjunction with the army, the shipping were employed, though after many disasters, with more effectual force, the enemy evacuated their works, and the river was at last cleared. But it was by this time the middle of November, and the season for action had elapsed.

But these events in the south were prosperity itself, compared with the issue of the northern campaign. After the evacuation of Canada by the Americans, in the summer of 1776, the incredible exertions of the British enabled them to drive the enemy from Lake Champlain. In an engagement between the two fleets, memorable for being conducted on both sides by land officers, General Arnold was completely defeated, and the Americans, after abandoning Crown Point, concentrated themselves at Ticonderoga. General Carleton, after his victory over Arnold, had led his troops into winter quarters, and from his former conduct, sanguine expectations were formed of his success in the ensuing campaign, when, much to the public astonishment, General Burgoyne arrived in the spring to supersede him. His object was to form a line of communication between New York and Canada. The first success of his career formed but too brilliant a contrast with its conclusion. The Americans, unable to resist him, abandoned Ticonderoga, and left behind them an abundance of stores. Their naval force at Skenesborough was destroyed, and Burgoyne, after a march of incredible labour and perseverance, fixed his head quarters at Fort Edward. In conveying his army with all its heavy artillery thus far, he had traversed morasses of prodigious extent; and, during the latter part of his march, had been obliged to construct forty bridges in the space of only twenty miles. After abundance of labour, his army at last came in sight of the North River, which promised many facilities of conveyance to Albany; but an American army was also before him, and collecting on all sides. His provisions were reduced, and a corps which he detached, to seize some magazines of the enemy at Benington and Fort Stanwix, were cut to pieces. In this perilous state, whilst he was in vain dispatching requests for General Clinton to come to his aid, he was attacked on the 19th of September by the army of General Gates, and, in a battle, which lasted from noon till sunset, the British had the bare advantage

of keeping the field. General Clinton having learnt the state of the northern army, made an effort to push up the North River, and relieve it. He found it impossible, and Burgoyne, with a hostile force forming on his rear, was left to his fate. On the 7th of October, an action more fatal to the British than the former, and in which the British camp was nearly taken sword in hand by the provincials, obliged this forlorn body to return to the heights behind their former encampment, and from thence to Saratoga. Here Burgoyne found the passes and the navigation of the river entirely possessed by the enemy. A nightly retreat to Fort Edward only remained; but while the measure was in agitation, intelligence was brought that the fords and high grounds on the way to that position had also been seized. Three days subsistence only remained in the camp, and it became necessary to sign a convention with General Gates, that the British troops should lay down their arms, on condition of being transported to Britain not to serve more during the war. Such was the catastrophe of an army, consisting, at its departure from Canada, of more than 10,000 men, but now reduced by the sword and hardships, to little more than half that number.

The parliament assembled on the 20th of November. In opposing the address proposed by ministers in the upper house, Lord Chatham delivered his memorable philippic against the employment of Indians in the war; but though the house listened for the time, as if electrified by his eloquence, it produced no change on their real temper or votes. The 3d of December was memorable, in the lower house, for the disclosure of the fate of Burgoyne. The minister acknowledged it with dejection, and even with tears; and, amidst the torrent of sarcasm and invective with which he was assailed by an increasing opposition, he entreated the house, with evident humiliation, to suspend their censures, till an impartial investigation of the business should take place. During the recess of parliament, the subscriptions that were raised by individuals for the support of the war, and the regiments which were thus furnished to government by several of the principal towns, seemed to reanimate the drooping spirits of ministers. It was evident, however, that their parliamentary strength had declined from the late disaster. On Mr Fox's motion for abandoning the plan of conquering America, the minority divided 165 against 259; and although the various other motions made by that speaker, as well as those of Mr Barre and Mr Burke, were rejected, the minister, by offering a second plan of reconciliation, made a virtual concession of past errors, which could not but strike his most determined adherents. The substance of this plan was brought before the house in two bills, on the 17th of February 1778.* To anticipate a little in the order of narration, the commissioners, Governor Johnstone, Lord Carlisle, and Mr Eden, who were empowered by these bills to treat with the congress, arrived at Philadelphia in the month of June; and, at the outset, made concessions far greater than the Americans, in their petitions to the king, had ever requested. They offered, that no troops should be kept in the States without their consent: they offered, in fact, to establish a perfect freedom of legislation and internal government, and every pri-

vilage to America short of total separation. But the secretary to the British commission was refused a passport to congress, and he was obliged to forward his papers by the common means. The substance of the answer of congress (delivered by their president, Henry Laurens) was, that the United States of America being independent, would treat with Britain for such terms of peace and commerce, as might be consistent with their other treaties already subsisting. As a solid proof of our sincerity to treat, they required *their* independence to be acknowledged, and *our* armies and fleets to be withdrawn. In the mean time, a treaty of amity and commerce had been concluded between France and America, and the former power had completed her preparations for assisting the youthful commonwealth. In the month of April, Count D'Estaing was dispatched with twelve ships of the line from Toulon. Admiral Byron, with a fleet from Portsmouth, was ordered to sail after him; but as the destination of the Frenchman was supposed to be the Delaware, and as the fleet of Lord Howe in that quarter was unable to protect our operations, if the hostile fleet should arrive there, the commissioners for peace had brought out to America an order for our own army to evacuate Philadelphia, and repair to New York.

Leaving for a moment the operations of the war, it may be proper to notice a division between the leaders of opposition in parliament, which may certainly be reckoned to have contributed to protract the duration of the war. The Marquis of Rockingham, and the whole Rockingham connection, maintained the necessity of admitting the independence of America. It was too late (they argued) to conciliate: it was impossible to overwhelm the colonies by force; and to persist in attempting it, was only to accumulate our debt, and accelerate our ruin. The Earls of Chatham, Shelburne, and Temple, who had, unhappily for the Whig interests, kept up a separate party, deprecated the concession of independence as ruinous and disgraceful. In one of the debates during the spring session of the present year, when the duke of Richmond moved to address the king for renouncing the impracticable object of the war, the earl of Chatham came to the house (declaring with a melancholy prediction, that it was probably for the last time,) to express his indignation at the idea of yielding up our sovereignty. He rejoiced that the grave had not closed over him, before he had lifted up his voice against the dismemberment of the empire. The Duke of Richmond having spoken in reply, Lord Chatham rose and endeavoured to give vent to some great idea that seemed to be labouring in his breast; but, unable to utter a word, he fell amidst the arms of his friends in a convulsive fit, and being conveyed to his villa at Hayes, in Kent, expired, after a few weeks, on the 11th of May. It would be rash to pronounce upon the consistency of so great a character, or to suppose that his views respecting America were not changed on grounds deserving serious consideration. Yet it seems at first sight difficult to reconcile his opinions on this momentous subject. If we could not force our taxes upon America, it is hard to conceive, that we could wrest from her her independence.

The spring of 1778 was far advanced, before the

* 1 A bill for removing all doubts and apprehensions with regard to the taxation of America, by the parliament of Great Britain.

2. A bill to appoint commissioners to treat with the Americans.

contending armies began to act in America. Count D'Estaing's fleet entered the Delaware in the beginning of July. A short time after, the British army, now commanded by Sir Harry Clinton, (Sir William Howe having resigned,) began their march through the Jerseys, from Philadelphia to New York. As they proceeded with an enormous baggage, extending twelve miles in length, they were assaulted on the 28th of June, in the vicinity of Monmouth Court house, by the van of Washington's army. In two attacks, the Americans were repulsed: the British rangers and light infantry, on the other hand, were obliged, from fatigue, to desist from an attempt on the main body of the enemy. The approach of night left both armies with nearly equal loss; but in the morning, the British army had retreated, and reached New York without farther molestation.

D'Estaing, missing Lord Howe's fleet in the Delaware, followed him to Sandy Hook; but the judicious position of the British admiral, and the difficulty which the French dreaded of passing the bar of the harbour of New York, saved our inferior force till Howe was joined by the squadron of Byron; and sailing after his antagonist, obliged the French and Americans to desist from an attempt which they had made upon Rhode Island. Owing to tempestuous weather, the hostile admirals, though mutually willing to engage, could not come to a general action. Disconcerted in his views upon the continent, the French admiral turned his efforts to the West Indies, and assisted the Marquis de Bouille in taking the island of Dominique, whilst the British enjoyed an equivalent triumph in the conquest of St Lucia.

On the continent of America, the war still raged with unremitted malignity;—the destruction of the beautiful settlement of Wyoming in Pennsylvania, by which a terrestrial paradise was converted into a frightful waste, and men, women, and children butchered indiscriminately by the Indians, is an event of horrible memory in this year's campaign. In a more civilized mode of warfare, Major-General Grey was so successful, as to destroy 70 sail of shipping and immense stores at Fair Haven, in New England, and to bring off an immense booty of sheep and oxen from Martha's vineyard, in the vicinity, for the use of the army at New York. On the banks of the North River, the same officer surprised, naked and asleep, a whole regiment of American light-horse. Quarter was refused; and if we may credit the solemn asseveration of the American congress, in remonstrating on this cruel transaction, the regiment were *massacred in cold blood*.

A squadron under Sir Hyde Parker, having on board a body of troops, commanded by Colonel Campbell, sailed for East Florida, from the head quarters of Sir H. Clinton, and on the 23d of December arrived in the Savannah. The force of the colony was unable to oppose them, and the town of Savannah fell into their hands. General Prevost soon arriving, with a large reinforcement, took the first command, and prepared to push his conquest over the province. When the design of France to assist America had become unquestionable, Admiral Keppel was appointed commander of the channel fleet, and sailed from Portsmouth, in June, with 20 ships of the line. War had not been proclaimed, nor had reprisals been ordered; but coming up with two French frigates, the admiral thought himself justified in taking them, and learning, from papers on board one of the captured vessels, that the French had, in Brest,

thirty-two ships of the line, he returned to port, and strengthened his fleet to thirty sail of the line. On the 27th of July, the fleets met, and fought for three hours. The French lost above 1000 men, the British about 500. This would have been a proud day for Great Britain, if Admiral Sir Hugh Palliser had obeyed the signals of the commander in chief, and come up with his squadron to make the victory decisive. His neglect of this duty, which the delicacy of Keppel forbore to mention directly, in his dispatches, came to light when the particulars of the battle were discussed in England. Palliser, whose misbehaviour had tarnished the glory of the day, was tried, and only slightly censured by a court martial. The venerable Keppel was also brought to trial, but he was honourably acquitted.

The session of parliament commenced on the 26th of November 1778. In the addresses, the most vigorous support was, as usual, promised, by great majorities, towards the prosecution of the war. The ministers continued successful, throughout the session, in baffling the successive motions that were made by the Rockingham party, to pass a censure on the principles, as well as the practical and particular conduct of the war; but the numbers of the minority were, on several great occasions, formidably increased. When Mr Fox moved for a vote of censure on the conduct of Lord Sandwich, the first lord of the admiralty, for having ordered Admiral Keppel to sea, with a fleet inferior to that of France, by twelve ships of the line, besides a great inferiority in frigates; his motion was supported by 174 votes to 246. It required, indeed, the whole force of the crown influence to protect that minister from the odium which his encouragement of the venerable Keppel's prosecution, and his general incapacity as a war minister, had excited. In the present question on his conduct, the testimony of Lord Howe was forcibly delivered against that minister; and that officer, already distinguished for a naval campaign of unexampled skill in the West Indies, declared, that under such council as the present ministry, he should deem it for ever impossible to serve his country. In a motion, which Lord Bristol made in the house of peers, similar to Mr Fox's in the lower house, for Lord Sandwich's removal; his Lordship established, that seven millions of money had been given to the support of our navy, during the last seven years, beyond any former period, and that, during that time, the decrease and decline of the navy had been in the inverse ratio of its expenditure. The Howes, having obtained a reluctant consent of the minister, that a parliamentary enquiry should be instituted, respecting their conduct in America, the result was, a declaration by the committee, that at no period had the force sent out to America been sufficient to subdue the provincials, and that there was no further prospect of success in attempting the conquest of America. The house, however, continued voting supplies, for this declaredly impracticable object.

Before the close of the session, his majesty announced to parliament, that Spain had been added to the number of our enemies. By the manifesto of the new enemy, it appeared, that her mediation had been asked by Britain, and obtained. When the terms of peace, however, came to be discussed, it was obvious that Spain, as well as France, were determined to make the recognition of American independence the basis of peace. Spain, however, declared her unwillingness to have commenced hostilities, even after the rejection of

this basis, and taxed the British government with injuries and hostilities, exactly amounting to an hundred acts. Their assiduity in collecting such a number of pretexts, bespoke no great confidence in the strength of any one of them.

During the recess of parliament, the Earl of Stormont succeeded the deceased Lord Suffolk as secretary of state. The Earl of Weymouth, a second time, resigned the seals of the southern department, to the Earl of Hillsborough; the Earl Bathurst succeeded the Earl Gower, as president of the council; and the Attorney General Thurlow, was created lord chancellor.

The commander in chief, in America, continued to conduct the war, by indecisive and predatory expeditions, either unable or afraid to bring the main force of the enemy to a general action. Sir George Collier and General Matthew made a descent upon Virginia, and laid the town of Suffolk in ashes. Governor Tryon, accompanied by the former officer, plundered and burnt Newhaven, in Connecticut, and some other places; and Collier succeeded in destroying a small squadron of the Americans, at the mouth of the river Penobscot, in New England. The Americans, on the other hand, were not without their successes. Two important posts on the north river, Stoney Point and Verplanks, had been carried by Sir Harry Clinton, in person, and had been diligently and strongly fortified. These places were recovered, by the troops of General Wayne, with circumstances of remarkable gallantry. The provincials carried the fortified lines of the British, with fixed bayonets, in the face of a tremendous fire; and disdaining to retaliate, for former cruelties, they signalized their victory no less by clemency than courage. At Paulus Hook, they surprised the British in a similar manner; but a better defence being made, they retired, though not without bringing off 200 prisoners.

In the West Indies, the island of St Vincent's was captured by D'Estaing; and Grenada, though bravely defended by the efforts of Lord Macartney, yielded to the arms of the same invader. A warm but indecisive action took place, between the fleet of D'Estaing and the British, under the Admirals Byron and Barrington; after which, the French Admiral anchored off the town of Savannah, and attempted, in conjunction with the American General Lincoln, to take that town; but was repulsed, by the British lines, with great gallantry.

On the 26th of December 1779, Sir Harry Clinton sailed, with the greater part of the army, from New York; and, in the spring of the succeeding year, arrived before Charleston, the capital of South Carolina. The city was defended by General Lincoln, in person, at the head of a numerous garrison, but yielded, on the prospect of a general assault, to the summons of the besiegers, and 6,000 of the continental troops, militia, and sailors, became prisoners of war. Leaving Lord Cornwallis to prosecute the war in that quarter, Sir Henry Clinton returned after the capture of Charleston, to his former head-quarters. Cornwallis immediately crossed the Santee, and carried the terrors of the British arms to the borders of North Carolina, cutting off several corps of the Americans; in which expeditions his lieutenant-general, then Colonel Tarleton, distinguished himself by peculiar bravery.

During these transactions, considerable alarm was excited in England by the junction of the French and

Spanish fleets in the Channel, which took place soon after the Spanish declaration of war. Sixty-five ships of the combined line, with a prodigious cloud of frigates and fire-ships, swept the Channel from shore to shore; obliged the British Channel fleet, under Sir C. Hardy, to retire into harbour; and, menacing the British coast with impunity, while Plymouth, by the negligence of ministers, was left so defenceless, that it escaped destruction only by the ignorance of the enemy respecting its true situation. On the approach of the equinox, the hostile fleet retired. The most remarkable result of the appearance of their vast armament on our coast was, the vigour and resolution with which it inspired the people of Ireland, who, seeing themselves neglected by England, their commerce unprotected, and their grievances unredressed, determined, by one effort, both to defend their country, and to assert their political rights. In a short time 50,000 volunteers were disciplined and equipped. By resolutions against the use of British manufactures, they taught England the immediate expediency of coming to an agreement with their demands; and these were extended, not to a partial, but a complete emancipation of their trade.

The subject of economical reform was pursued with great spirit during the session of 1779-80, in both houses; by the Duke of Richmond in the peers, and by Mr Burke in the commons.* Their motions were rejected; but the sixth of April was signalized by a victory of the opposition, whose numbers had of late increased, as the aversion of the nation to the principles of the war, and to the system of corruption which had so long given sanction to it, daily grew more apparent. Mr Dunning moved, "that the influence of the crown had increased, was increasing, and ought to be diminished." This was passed by a majority of eighteen; and in several subsequent motions the minister found himself in a minority. An unusual recess of parliament, however, gave the court time to recover from this blow. During that interval they rallied their broken ranks, and brought so many deserters back to their standard, that at the next debate, on addressing his majesty that parliament might continue to sit till the petitions of the people for reform were answered, they recovered a majority of 51. Mr Fox, on this decision, rose with indignation, and exposed the shameless inconsistency, the breach of a solemn engagement, of those who had thus basely deserted the cause of reform.

While these extraordinary turns of fortune attended the contest of parties, an event took place, which, for a time, overwhelmed party spirit itself in the danger of the state. After the passing of a humane bill in favour of the Catholics, associations, originating in Scotland, had taken place over the whole kingdom, to petition the legislature for its repeal. Lord George Gordon, an insane branch of a noble family of Scotland, and a member of the lower house, headed these associations. On the day appointed for the grand association in London to deliver their petition to parliament, the rabble assembled, by his invitation, to an immense number, in St George's Fields, and proceeded to Westminster, where they surrounded, insulted, and besieged the two houses. The arrival of the guards with difficulty protected parliament; and the mob, on that day, contented themselves with demolishing some chapels of the Roman Catholics. During several succeeding days, the riots and burning

* In his celebrated bill for regulating his majesty's civil establishment.

of houses continued unchecked. The members of parliament who continued to meet, were exposed to insult and outrage on their way to Westminster, till at last they determined to adjourn, till the arm of executive authority should rescue them from danger. Encouraged by impunity, the mob proceeded in the work of devastation,—emptied the prisons, destroyed and pillaged an immense number of houses, and at last threatened the Bank itself. London was seen, from one spot, blazing in thirty places. Houses and property to the amount of millions were sacrificed to their fury. The shops were shut, and all business was at a stand. The arm of the civil power had hitherto been shamefully idle; but his majesty declaring with spirit, that the executive power should interfere, orders were given to fire upon the rioters; and detachments were brought from many miles round London. Several hundreds of the insurgents were killed by the platoons of the military, and in a few days tranquillity was restored.

Lord George Gordon was arrested on a charge of high treason, and conducted under a strong escort to the Tower. He was acquitted, on proofs of insanity, while many of his meaner associates atoned for their crimes on the gallows. To complete the satisfaction of public justice, the lord mayor, whose neglect of timely interference was regarded as a principal cause of the latter excesses, was prosecuted and convicted. The session was closed by a speech from the throne, on the 8th of July; and, in September, a new parliament was called.

To resume the thread of the narrative of transactions in America. The fall of Charleston having apparently secured to us the whole province of South Carolina, and Colonel Tarleton's detachment having defeated the fugitive American army, General Clinton returned to New York, leaving Lord Cornwallis behind him to prosecute the conquest of the northern provinces. The American corps were, however, recruited, by strong reinforcements, and, uniting under General Gates, gave battle to Lord Cornwallis at Camden, near Lynchis-creek. Here they were severely defeated, and for a time dispersed; and a way was opened for the victors to North Carolina; while numbers of American partizans, by force and persuasion, were compelled or induced to join the royal standard. While this victory was hailed by the sanguine partizans of Britain as decisive, the defeat of several detached corps of the British army quickly turned the tide of fortune. Major Ferguson was cut off at King's Mountain, and his army obliged to surrender, by a body of American horsemen. Colonel Tarleton with difficulty, and by incredible bravery, cut his way through the enemy, and retired from active hostilities. Lord Cornwallis was obliged to retreat to the south. The war in the northern provinces of America seemed, through the whole of the summer of 1780, to be nearly at a stand. On the 10th of July, a large body of French troops, under General Rochambeau, arrived at Rhode Island. While the assistance of this new ally was rendered ineffectual by the blockade of a British fleet under Admirals Graves and Arbuthnot, the American general Arnold, proving faithless to the cause of the United States, engaged to deliver into the hands of the British the important post of West Point, which was called the Gibraltar of America, and was the repository of their most valuable stores. Major André, a young officer of high character and bravery, who was selected by General Clinton to conduct the negotiation with the

apostate American, by an unfortunate mistake fell into the hands of the enemy's scouts while he was within their lines, was brought to trial, and executed as a spy. Arnold escaped to the British lines, and was made a brigadier-general. When the winter set in, the army of Clinton was confined to New York, and its dependencies. The French troops remained at Rhode Island; and the army of Washington, distressed by many privations, continued on the mountainous grounds adjacent to the North River.

The year was memorable for the declaration, by the powers of Europe, of that armed neutrality, by which they engaged to resist the British in the exercise of the right of searching neutral vessels. The intentions of Holland, which before had been suspicious, were brought to a proof by the discovery of a treaty with America, which was thrown overboard one of her captured vessels, but was rescued by the intrepidity of an English seaman before it sunk. Letters of reprisal were issued against her on the 20th of December.

The war between Britain and Spain had scarcely commenced, when the blockade of Gibraltar was formed by sea and land. Sir George Rodney was sent out with the command of a fleet to the relief of that place. After capturing a squadron of seven ships of war on the north of Spain, he next engaged a fleet of fourteen sail of the line off Cape St Vincent, where he captured and destroyed several of the enemy's largest ships; and, after effecting the relief of Gibraltar, proceeded to the West Indies. In this quarter he had an indecisive engagement with the French admiral De Guichen, (on the 17th of April,) in which the enemy retired, and, from unfortunate circumstances, could not be pursued. The Spanish governor of Louisiana reduced the British settlements on the Mississippi, and made considerable progress in West Florida. Our East and West India merchant fleets were captured in the autumn of the year: a loss scarcely paralleled in our naval and commercial history.

A new parliament met on the 31st of October 1780. In the first session, it appeared that ministers had secured in this new parliament the superiority of numbers, which they had lost and recovered in the former. The famous reform bill of Mr Burke was revived, but rejected *in toto*, and all the calls of the nation for economical reform were set at defiance by ministers. Towards the end of the session, Mr Fox made a motion for devising means of accommodation with America. His motion was supported, in an animated speech, by Mr Pitt, who expressed his utter abhorrence of a war, "which was conceived," he said, "in injustice, nurtured in folly, and whose footsteps were marked with slaughter and devastation. It exhibited the height of moral depravity and human turpitude. The nation was drained of its best blood and its vital resources, for which nothing was received in return, but a series of inefficient victories, or of disgraceful retreats: Victories obtained over men fighting in the holy cause of liberty, or defeats which filled the land with mournings, for the loss of dear and valuable relations, slain in a detested and impious quarrel."

The first important military affair of the year, was an attempt of the French to recover the island of Jersey. On the 16th of January, early in the morning, a landing was effected by the Baron de Rullecourt, at the head of 800 men; and, to the astonishment of the inhabitants, when the day began to dawn, the market place of St Helier, was found occupied by French troops. The

governor's house being surrounded, he was compelled, by threats, to sign a capitulation; but when Elizabeth Castle was summoned, Captain Aylward, refusing to abide by the orders of a governor already a prisoner in the enemy's hands, fired upon the French, and, by the efforts of the gallant Major Pierson, who unhappily fell in the action, the militia and troops at last obliged the enemy to surrender.

In February, Admiral Rodney and General Vaughan, made an easy prize of the island of St Eustatia, an immensely valuable depot of wealth and traffic. The Dutch settlements of Demerara, Berbice, and Essequibo, on the southern main, also submitted, without resistance, to our arms. Tobago, however, was taken by the French, and St Eustatia was soon after recovered. Spain was also successful in completely conquering West Florida. In the course of the summer (August 5) an engagement took place off the Dogger Bank, between an English squadron, commanded by Admiral Hyde Parker, and a Dutch squadron of equal force, under Admiral Zoutman, who had under convoy the Baltic trade bound to the Texel. The fleets approached within musket shot of each other before they opened their fire, and, after a cannonade of three hours and a half, they both lay like logs in the water, incapable of mutual annoyance. The Dutch after some time bore away with their convoy for the Texel, which they reached with great difficulty, the *Hollandia*, one of their largest ships, having sunk the night after the action.

The American campaign of 1781 opened with a circumstance apparently favourable to the British arms. The revolt of the Pennsylvanian line of the American army offered a glimpse of hope to General Clinton, that he might seduce them to join the royal standard; but their grievances were redressed by congress, and they returned to their duty. In preparing to enter North Carolina, Lord Cornwallis sent forward Colonel Tarleton to the district of ninety-six; but that active officer was defeated by the provincials under Morgan, and obliged to retire. In spite of this defeat, Lord Cornwallis pushed forward into North Carolina, and, attacking the main army of the enemy under General Greene at Guilford, obtained a victory, dearly purchased, with the loss of 600 men. This nominal victory, carrying to the British nearly the same disasters as a defeat, obliged Cornwallis to change his course to Wilmington, at the mouth of Cape-Fear River, and enabled General Greene to push forward to the south. From Wilmington, Cornwallis led his army to Petersburg in Virginia. The divisions which he left behind him were attacked at the Eutaw Springs and at Camden, by the Americans under Greene, and were handled so severely, that they were obliged to retreat, though, on each successive day of battle, they had the honour of keeping the field. In less than twelve months, Greene had recovered both the Carolinas.

In the mean time, General Clinton, who was threatened by Washington in New York, tamely saw that commander retire to the south across the Delaware; and believing that he only meant a feint, to divert his attention from the siege of New York, suffered him to be joined by the French troops, which the fleet of Count

de Grasse had brought into the Chesapeake.* The object of Washington was to join the other forces, which, in different bodies, were now moving to surround Lord Cornwallis at Yorktown. On the 29th of September, that place was invested by the combined armies; and in three weeks more, the British batteries being completely silenced, Lord Cornwallis surrendered, with his whole army, prisoners to the allied armies of France and America. This terminated our offensive hostilities in America.

The events of the campaign in America having been known before the next meeting of parliament in November, the ministerial address to the throne was combated by arguments which carried into every part of the British dominions a full conviction, if not of the folly and injustice, at least of the disastrous conduct of the war. Towards the end of the year, the ministerial majorities fell rapidly; and early in 1782, upon a motion made by General Conway, for putting an end to hostilities, the opposition were triumphant by a superiority of 19 votes. This victory was followed up by an address of the whole house to his majesty, for terminating hostilities; and on the 20th of March, Lord North announced to the House of Commons, that his own administration was at an end. A new ministry was formed on as broad a basis as the nature of things would admit, including the partisans of the two parties, who divided the Whig interest, namely, the Rockingham party, who derived its name from that nobleman, and its vigour and popularity from the talents of Mr Fox, and that other party, which, since the death of Lord Chatham, had regarded Lord Shelburne as its political leader.† The Marquis of Rockingham was appointed first lord of the treasury; the Earl of Shelburne and Mr Fox, secretaries of state; Lord Camden, president of the council; Lord John Cavendish, chancellor of the exchequer; the Duke of Grafton, privy seal; the Duke of Richmond, master of the ordnance; Lord Keppel, first lord of the admiralty; General Conway, commander in chief; Mr Burke, paymaster of the forces; Lord Thurlow was continued lord chancellor; and Mr Dunning, created Baron Ashburton, was made chancellor of the Duchy of Lancaster. The first act of the new administration was to accept an offer already made by Russia, of her mediation between Holland and Great Britain. This offer their High Mightinesses did not chuse to accept; but negotiations for a general peace were almost immediately commenced, and Mr Grenville was sent to Paris with full powers to treat with all the parties at war.

In consistency with the principles which they had avowed, the new ministry began their career by the most popular and promising acts of reformation. Their resolutions for the better management of Indian affairs, are too complicated to be detailed in the present sketch, and we must refer the reader for them to a different article: (See INDIA.) A retrenchment in the expenditure of the civil list was accomplished. The independence of the Irish parliament was declared. Two acts were also passed, excluding revenue officers from parliamentary elections, and contractors from sitting in parliament; and ministers, to record those intentions which unhappily they were never suffered to fulfil, moved, in a

* The English fleet under Admiral Graves had attempted to obtain possession of the Chesapeake; but after a warm engagement were obliged to leave the French in possession of it.

† Though the Shelburne party coincided with the other opponents of ministry in their present efforts against the original makers of the American war, they spoke with great caution on the subject of its continuance, and some of them openly reprobated the idea of conceding the independence of America.

committee of the whole house, a series of resolutions for economy in the revenue, and the abolition of useless offices, with which they were to have proceeded very early in the ensuing session.

To return to the events of America: no action of any importance took place after the capture of the British army at Yorktown. The Spaniards, embarking from Cuba, invaded and took from us the Bahama islands. Nevis, Montserrat, and St Kitts, had been taken from us before the end of the former year; and Jamaica, the great object of Spanish ambition, was threatened by the combined fleets of France and Spain, which, if successful, would have poured upon it a land force of 20,000 invaders. To prevent the junction of the hostile fleets, admiral Rodney fortunately reached the West Indies in the month of February, and brought the fleet of De Grasse to action, between the islands of Guadaloupe and Dominique, while the Frenchman was attempting to reach the Spanish fleet at Hispaniola. Rodney's force consisted of 36, De Grasse's of 34 ships of the line. After a glorious action, which lasted with few intervals, from seven in the morning till night, the British had taken or destroyed eight capital ships of the enemy, and among these De Grasse's own ship, the largest that had ever been built in Europe.

The island of Minorca, after a siege of 171 days, surrendered to the power of Spain. Its emaciated garrison, scarcely able to pile their arms at surrendering, gave up rather to famine and sickness, than to the bravery of their captors, who were commanded by the duke de Crillon, and amounted to 16,000 men.

The defence of Gibraltar was one of the few brilliant events of this disastrous war. A sortie of the garrison, during the former year, had destroyed the principal works of the besiegers; but the arrival of the conqueror of Minorca, with 20,000 French and Spanish troops, the presence of a powerful fleet, and the invention of floating batteries, which were deemed impregnable, gave new hopes to the besiegers. On the 13th of September, the combined fleets having anchored the preceding day between Orange-grove and Algesiras bay, moored about 1000 yards from the walls of the garrison, and opened a fire from 400 pieces of artillery. The garrison directing their fire chiefly on their battering ships, beheld, for some time with uneasiness, their heaviest shells rebounding from the roofs of those bulwarks, while the largest cannon balls made no visible impression on their hulls. Governor Elliot, however, was still confident in the effects of the heated balls, which had been ascertained in former experiments, and encouraged his men to redouble their efforts. Symptoms of confusion and combustion were at last discovered on board the Spanish admiral's chief battering ship. Towards evening a general disorder was visible in their line; their fire slackened, and almost ceased before night. During the night, their signals and cries of distress, and the arrival of a floating wreck, with only twelve survivors, gave sufficient proof of what the red hot balls had produced. An hour after midnight, the Spanish admiral's ship was in one blaze. Others succeeded to rise in conflagration, till in the progress of the succeeding morning the chief business of the British, besides completing the destruction of the gun-boats, was to save numbers of the crews of the hostile vessels from the sea, or from destruction by fire. The enemy lost 2000. The garrison had not an hundred killed. The sole hopes of the enemy now rested on their fleet, which was still su-

perior to that of lord Howe: yet that gallant admiral sailed boldly into the place, and returned, after a partial encounter with the enemy's ships,—having performed, in relieving the garrison before so superior a force, an act which astonished all Europe.

The happy prospects which the nation enjoyed in a skilful and popular cabinet, were unfortunately clouded within a year, by the death of the marquis of Rockingham. Of the Whig parties, who were more than ever divided by this event, that of the earl of Shelburne was the most agreeable to the crown, and that nobleman was appointed to succeed the marquis as first lord of the treasury; Mr Fox, lord John Cavendish, and Mr Burke, declaring that they could not act with a cabinet in which the principles of the old system were to be revived, immediately resigned. Mr Pitt was appointed chancellor of the exchequer, and other vacancies were filled up by the friends of the earl of Shelburne.

The treaty, which had been begun by the former administration, was brought to a conclusion by the present. On the 30th of November 1782, provisional articles of pacification with America were signed at Paris; and on the 20th of January 1783, they were signed with France and Spain. The thirteen United Provinces were declared free and independent states, and by a boundary very favourable to America, the whole country southward of the lakes on both sides of the Ohio, and eastward of the Mississippi, was ceded to the colonies, with a full participation of the fisheries on the banks of Newfoundland and the Gulf of St Lawrence. In return for this concession, the Congress engaged to recommend to the several states to provide for the restitution of the confiscated estates of the royalists, a recommendation which proved, as might have been foreseen, entirely nugatory. By the treaty with France, Great Britain guaranteed to that power the island of Tobago, and restored St Lucia; also the settlements of Goree and Senegal, in Africa; and the city of Pondicherry, with our conquests in the East, and some additional territory. Our claims respecting Dunkirk were expressly relinquished. France, on her part, agreed to restore all her valuable and important conquests in the West Indies, Tobago only excepted. His Catholic majesty was allowed to retain Minorca and West Florida, East Florida being also ceded in exchange for the Bahamas. The preliminaries with Holland were subscribed much later in the year. By these the states general yielded and guaranteed to his Britannic majesty the town of Negapatam in the East Indies, with its dependencies; the restitution of it being, however, left open to be treated for on the offer of a just equivalent.

When the terms with France, Spain, and America, were submitted to parliament, they underwent the severest animadversions. It was now that a coalesced opposition sprung up, which, while it astonished the nation by its novelty, for a time overwhelmed all resistance. Mr Fox, in his indignation at the conduct of the Shelburne party, did not hesitate to unite his strength with his old and avowed antagonist, lord North. Mr Fox defended the union, by declaring, that the question of American independence being now at rest, he had no desire to perpetuate his enmities with a statesman, whose views were directed, like his own, to displace from power a ministry composed of men who had been unfaithful to their principles; and his object, he avowed, was, by the joint force of their friends, to ensure a great and popular administration. The nation at large

viewed this coalition with disapprobation. Our business is only to record its effects. Such was the strength of the united opponents, that in two instances they outvoted the ministry. A motion for addressing his majesty for a new choice of servants was victoriously carried; and on the 2d of April the cabinet council was thus formed anew. The duke of Portland was appointed first lord of the treasury; lord North and Mr Fox, principal secretaries; lord John Cavendish, chancellor of the exchequer; lord Keppel, first lord of the admiralty; lord Stormont, president of the council; and the earl of Carlisle, keeper of the privy seal. If the coalition which had formed the present ministry was unpopular, the career of their most formidable opponent, Mr Pitt, was at this time calculated to excite the highest expectations in the public of an enlightened and patriotic statesman. He stood forward as the most active champion of reform. In a former session he had made a general motion for an enquiry into the state of representation. He now brought forward a specific plan for adding an hundred members to the county representation, and abolishing a similar number of the obnoxious boroughs. His plan, though supported by Mr Fox, was negatived by a large majority.

For some time the total derangement of the finances of the India Company, and their utter incompetency to govern the vast territories of which they had obtained possession, by very questionable means, had become too evident to admit of contradiction. The evil was notorious; the only difficulty was to devise an adequate remedy. On the 18th of November, Mr Fox introduced a bill, by which he proposed to take from the directors and proprietors the entire administration of their territory and commercial affairs, and to vest the management of them in the hands of seven commissioners irremovable by the crown, except in consequence of an address from either house of parliament. The act was to continue in force for four years, and was accompanied by a second bill, containing regulations for the future government of India. The greatest commotion was, however, excited by the disclosure of this plan; while it was on one side of the house extolled as a master-piece of genius, virtue, and ability, it was on the other reprobated as a violation of chartered rights, and an ambitious design of ministers to make themselves immoveable and despotic, by assuming the power and patronage of India. The India Company, the city of London, and other chartered bodies, petitioned or entered into resolutions against the bill. It passed the Commons, however, though in the Lords it was rejected by a majority of 95 to 76. This rejection is to be traced to a proceeding deservedly reprobated. On the 11th of December, earl Temple demanded a conference with the king, in consequence of which a card was handed about, intimating that his majesty allowed earl Temple to say, that whoever voted for the India bill, was not only not his friend, but would be considered as his enemy; and if these words were not strong enough, earl Temple might use whatever words he might deem stronger or more to the purpose. A change of ministry was immediately resolved upon; and on the 18th of December, a message from his majesty arrived to the two secretaries of state, demanding the seals of office. In a few days, Mr Pitt was appointed first lord of the treasury and chancellor of the exchequer; the marquis of Carmarthen, and Mr Thomas Townsend, (created lord Sydney,) secretaries of state; lord Thurlow, lord chancellor; earl Gower,

president of the council; the duke of Rutland, lord privy seal; lord Howe, first lord of the admiralty; the duke of Richmond, master of the ordnance; and Mr Henry Dundas, treasurer of the navy.

The majority of the House of Commons, however, still adhered to the dismissed ministers: they addressed the crown, to pray that the alarming reports which had gone forth, of an intended prorogation, or dissolution, might not be realized; to which they received an explicit answer from his majesty, that after their adjournment they should not be disturbed, by being either prorogued or dissolved. When the house assembled, after the Christmas recess, the majorities of the opposition still continued, and exhibited, at once, the novel spectacle of a minister holding his place in contempt of the voice of the commons, and of an opposition binding up the hands of the executive, by withholding their assent to payments being issued from the bank, or the exchequer, for public service. It was even moved in the house, and declared, that the continuance of the present ministry would be injurious to his majesty, and to the people; but the minister still kept his place. The king, by a message to the duke of Portland, delivered indirectly through the medium of Mr Pitt, expressed his desire that an interview might take place, between his grace and the young premier, for arranging a new plan of administration, on fair and equal terms. The duke required that he might be permitted to construe this message as a virtual resignation on the part of Mr Pitt. This interpretation was refused; the supplies were postponed, and ministers continued to be outvoted by their opponents. The peers, however, were roused, by this obstinacy of the lower house, to pass two resolutions, expressing their disapprobation of the conduct of the commons, and their determination to support the crown in the choice of its ministers.

It is difficult to pronounce what would have been the issue of this contest, if the wishes of the crown and the commons had continued to be fairly balanced against each other. But the public voice was decidedly expressed in favour of the new minister, whose popularity was recorded in the numerous addresses in his favour from every quarter of the nation. The majorities of the opposition, in the commons, were also visibly declining, and their last remonstrance was carried by a solitary vote. The measures of the coalition grew less bold, as their ranks were thinned by desertion; so that, in March, the supplies were regularly voted, and the mutiny bill passed without a division. Still, however, it was thought unsafe to trust farther to a parliament, from whose resistance the executive had escaped, only by the desertion of temporising members. It was, therefore, in spite of the late promise of his majesty, dissolved on the 25th of March, and a new one convened on the 18th of May.

The elections for the new parliament were wholly favourable to ministers; and so complete was the rout of the coalition party, that of 160 members who lost their seats, nearly the whole were the friends of either Mr Fox or lord North. The most important business of the first session was the arrangement of a plan for the future government of India. The bill which Mr Pitt introduced for this purpose, was founded on the same principles with one which he had formerly proposed, but which the late parliament had rejected, during their struggles with him, after his first appointment. By this bill, a board of controul was to be established, of which

the commissioners were to be of the rank of privy counsellors; they were to be appointed by the king, and removeable at his pleasure. They were to check, superintend, and controul, the civil and military government and revenue of the company. The dispatches, transmitted by the court of directors to the different presidencies, were to be previously subjected to the inspection of the superior board, and countersigned by them. The directors were enjoined to pay obedience to the orders of the board, touching civil and military government, and revenues; and in case such orders, at any time, related to points not connected with these, they were empowered to appeal to his majesty, whose decision was to be final. The appointment, by the court of directory, to the office of governor general, president, or counsellor in the different presidencies, was to be subject to the approbation and recal of his majesty. A high tribunal was created for the trial of Indian delinquents, consisting of three judges, one from each court, of four peers, and six members of the House of Commons, who were authorised to judge without appeal, to award, in case of conviction, the punishment of fines and imprisonment, and to declare the party convicted incapable of serving the East India company. Mr Fox, in opposing the bill, pronounced it, at once, insufficient, insidious, and unconstitutional. It pretended to take a controul over the company without invading their charters; but it did invade their charters, by the enlarged power of the board of controul. Yet it did not transfer that power to the proper channel, to which all power ought to revert, to the parliament, but drew the richest servants of the company into a dangerous dependence upon the crown. But Mr Fox, with his accustomed eloquence and powers of discrimination, was unable to excite the general attention to the demerits of the measure in question. The bill had received the assent of the East India company; though slowly and reluctantly given, it was carried triumphantly through both houses, and was the subject of but little emotion without the walls of parliament. The public, who beheld with indifference the whole patronage of India, virtually vested, by one act, in the crown, expressed considerable disapprobation at an act which passed during this session, entitled "the commutation act," by which the ancient duty on tea was lowered, and the deficiency to the revenue made up by a tax upon windows. The supplies of the year returned a loan of six millions, which was negotiated by the minister, at nearly five per cent., with a *douceur*, to the subscribers of six lottery tickets, for every thousand pounds. Provisions were made, during the session, for paying off the arrears of the unfunded debt, left at the conclusion of the war, amounting to nearly 20 millions, by other taxes, which, upon the whole, were allowed to be happily and judiciously chosen. The peace which the nation now enjoyed, and the firm hold of his power, which the minister kept, enabled him to bestow his attention on plans of commercial and financial arrangement. On the 24th of January 1785, the session was opened by a speech from the throne, the principal feature of which, was a recommendation to parliament to apply their earnest attention to the adjustment of such points, in the commercial intercourse of Great Britain, as had not been yet finally arranged.

By a laudable and wholesome bill, which was passed during this year, considerable reformation was effected in the auditing and examining of public accounts, and

the regulation of public offices. The balances of the navy and ordnance offices, and of the paymaster of the forces, were ordered to be paid into the bank. Many of the inferior departments of office, or heads of service, were consolidated; and the whole assumed an aspect of regular and rational system.

Provision was made for funding in the 5 *per cent.* stock, the remaining floating arrear of debt, consisting of navy bills and ordnance debentures; fresh taxes, of which the amount was calculated at 400,000*l.* These taxes were passed with slight opposition. One only was particularly obnoxious. This was a tax on retail shops. It was shewn by the whole body of retail traders, that, for obvious reasons, it was impracticable to indemnify themselves for this imposition by raising the price of commodities on their customers; and thus a speedy ruin was threatened to thousands of the most industrious and useful of the trading community. By way of recompense to the shopkeepers, Mr Pitt proposed to annihilate a class of traders, still poorer and less capable of remonstrance; by revoking the licences from all hawkers and pedlars; whom he styled, a pest to the community, and a nursery for illicit trading. Far from being pests to society, it is known how useful these itinerant traders are, to the remote inhabitants of the country. Like all other traders, these men were liable to detection and punishment in the act of illicit traffic; but to prohibit them from the fruits of their honest labour, was justly censured as despotic in principle, and cruel in proportion to the poverty of the sufferers.

In the business of the succeeding session, the minister's plan for extinguishing the national debt, holds a distinguished place, and indeed forms an era in the history of the country. The plan was founded on a report, framed by a select committee, who had sat during a part of last year, and who had examined the annual income and expenditure of the state. By the report of this committee it appeared, that the public income for the year 1785, had been 15,379,000*l.*, and the expenditure 14,478,000*l.*, leaving a surplus of 901,000*l.* This surplus the minister proposed to increase to one million, and to appropriate for ever after this yearly million most sacredly to the exclusive purpose of extinguishing the national debt. Commissioners of the highest respectability were to be chosen for the important service of purchasing in the funds towards the redemption of the public debt. Several savings of expense, and overflowings of revenue, would fall into this fund, which, in the course of 28 years, would produce four millions a year. The propriety of liquidating the national debt being acknowledged on all sides, the motion was carried without a division.

In the progress of the bill, an amendment was suggested by Mr Fox, and gratefully received by the minister, viz. that whenever a new loan should hereafter be made, the commissioners should be empowered to accept the loan, or such proportion of it, as should be equal to the cash then in their hands; the interest and *douceur* annexed to which, should be applied to the purposes of the sinking fund. Another clause, enabling the commissioners to continue purchasing stock for the public, when at or above par, unless otherwise directed by parliament, was moved by Mr Pulteney, and carried.

Next to the establishment of the new sinking fund, the affairs of India occupied during this session the principal attention of parliament. The trial of Warren

Hastings for alledged crimes and misdemeanours in his government of India, was brought on by Mr Burke, who had for some time held out his threats of impeachment. On the 4th of April Mr Burke came forward fully prepared for the charge, and solemnly exhibited against the late governor nine articles of accusation, which in the succeeding week were completed to twenty-two. The chief substance of these charges was, Mr Hastings's receiving illegal presents—making unjust war upon the native princes, and oppressing their defenceless subjects. The first charge related to the Rohilla war, on which subject the governor obtained a decision by a majority of the commons, that there were *not* grounds of impeachment. A more important charge was soon afterwards produced, relating to the expulsion of a native potentate, Cheyt Sing, from the Zemindary of Benares, and Mr Hastings's severe and unjust conduct in that province. By the supreme council of India it had been solemnly decreed, that the native prince Cheyt Sing, and his heirs for ever, should enjoy the Zemindary of Benares on condition of giving only the usual payment of revenue hitherto paid to the late vizier. For refusing to pay beyond this sum, the native prince was expelled from his territory, and his people were put to the sword. The friends of Mr Hastings saw with dismay, that the minister himself could not but side with his accusers. Mr Pitt acknowledged, that, admitting the right of the governor to have taxed the Zemindar, his conduct had been unnecessarily severe. On this charge the commons decided, that there were grounds of impeachment. But beyond this decision nothing of importance towards the trial was accomplished in the present session, which was closed by prorogation on the 11th of June.

The new taxes were few and light, being only extended to fill up the deficiencies of the sinking fund. It was during this year that the hand of a wretched and obscure lunatic, Margaret Nicholson, had nearly deprived the sovereign of life. On the 2d of August, as the king was alighting from his carriage at St James's, a woman, who pretended to deliver a paper, struck at his majesty with a knife, but happily without effect, as the instrument was blunt and slender. She was immediately arrested, and examined by the physicians in presence of the privy council, who, on full proof of her insanity, committed her to Bethlem Hospital. The addresses of the people, on this occasion, evinced the strength and sensibility of their loyalty.

In the session which commenced with the year 1787, the attention of parliament was early directed to a treaty of commerce with France, which his majesty had concluded, and of which he ordered a copy to be submitted to parliament. The terms and principles of this treaty seem to have been treated by opposition with undeserved severity. In comparing the pecuniary advantages which would accrue to each of the two countries, it appeared, by Mr Pitt's statement, that although the revenue of France would be benefited to the amount of 100,000*l.* a year, the annual gain of our revenue would be a million. A market was opened for our hardware, cutlery, cabinet, turnery, cotton, woollen, hosiery, and porcelain manufacture, on paying an easy duty of 10 or 12 per cent. *ad valorem*. On our part, we agreed to lower the duties on wines, brandies, and olive oil. A plan for consolidating the duties of custom was brought forward by the minister on the 26th of February. By this plan, he proposed to abolish all the duties as they had existed

hitherto, in a complex and confused shape, and to substitute in their stead a single duty on each article. The excise, also, though not so intricate as the customs, needed reform and regulation; and the duties on single articles, such as candles, spirits, &c. were to be brought into one point of view, and rendered so simple in the collection, that there could be no danger of mistaking them, or of being obliged to trust implicitly to the collecting officers. Another financial regulation was adopted, though with less unanimity. In collecting the duty on post horses, it was notorious, that the revenue had been largely defrauded every year, by the collusion between collectors and innkeepers. To supersede those frauds, the minister proposed to divide the country into districts for collecting the tax, and to farm it. Mr Windham, with great force, represented the practice of farming as a novelty of dangerous precedent in our constitution, a practice peculiar to despotic constitutions, and which, in the present instance, would leave one of the highest powers of the executive government to men, who, if the subject were aggrieved, would be absolutely beyond the reach or controul of parliament, till their farming lease had expired. The numbers of the opposition rose considerably in the votes on this question.

The English dissenters, a body of no insignificant weight in the public scale from their numbers and respectability, had been the warmest supporters of Mr Pitt in the last elections, and looked with sanguine zeal to the support of the minister in their pretensions to farther toleration, which they now expected from the growing liberality of peaceable times. In the present session, Mr Beaufoy made a motion for repealing the corporation and test acts, and was seconded by Mr Fox with his accustomed energy. It was not without surprise, that the dissenters beheld, in the person of that minister, for the sake of whose elevation they had cried and resisted Mr Fox, a severe opponent to their claims. Mr Beaufoy's motion was rejected by a large majority.

The subject of Mr Hastings's impeachment had been resumed early in the session, and had occupied a large proportion of it. On the 7th of February, Mr Sheridan opened the third charge against the late governor, respecting his cruelty to the Princesses of Oude, the wife, the mother, and the family of Sujah Dowlah, our own ally in India, whose treasures were their only treasons; but who were turned out of their palace by Hastings, (who had been constituted their guardian,) to the rigour of the merciless seasons, and to the yet more merciless soldiery. These, and other charges, having been successfully voted as grounds of impeachment by a majority in the commons, the minister himself being unable to resist the conviction of the most important charges, it was voted, (May 10.) that Mr Hastings should be impeached; and Mr Burke accordingly did impeach him, at the bar of the House of Lords, of high crimes and misdemeanors.

The session was closed by a speech from the throne, on the 30th of May, in which his majesty, after expressing his satisfaction at the prosperous situation of the empire, and the general tranquillity of Europe, lamented the dissensions which unhappily prevailed among the states of the United Provinces.

Since the conclusion of the war with England, Holland had been torn by internal dissensions. Involved, as she had been, in a quarrel with the Emperor of Germany, from whose vengeance and rapacity she was with

difficulty saved by the interference of France, the faction of the Louvestein and of the Prince of Orange came, in 1786, to actual civil war; and the states of Holland took the violent resolution of suspending the stadtholder from his office of captain-general of the provinces. The new monarch of Prussia, Frederick William, whose sister was the Princess of Orange, feeling for his relatives, and anxious to make a display of his power, interfered, through his ambassador, with the states general. They, more temperate in their views than the states of Holland, were unfortunately too feeble to overawe the latter, and were unable to settle the dispute by the mediation of Prussia and Britain, although they wished to do so. The states of Holland, on the contrary, were in the interest of France, and solicited the court of Versailles to interpose their mediation. The French ambassador answered tardily, that his most Christian majesty would assist the Dutch, in case they were attacked by any foreign power. As soon as this declaration was known, it animated the court of London to act with greater spirit and decision in support of the stadtholder, and the most vigorous naval preparations were made to second the king of Prussia, in case France should oppose him by land. This promise was made by France in September; but, in the mean time, an accidental circumstance having drawn the king of Prussia to change his remonstrances into actual hostilities against the opponents of the stadtholder, decided the fate of Holland for the present, and afforded France an opportunity of evading her promise, since the insurgents were actually quelled before France could have interfered. The Princess of Orange, a bold and high spirited woman, had taken the resolution of going to the Hague and addressing the people, trusting to her own popularity and eloquence. She was, however, insulted by the populace, and for some time kept a prisoner in their hands. This insult roused Frederick William, who, at the head of 20,000 men, entered Holland. The Dutch patriots fled every where before him. The cities most distinguished for democratical zeal surrendered almost as soon as summoned. On the 10th of October, Amsterdam opened its gates to the victor. Such was the event of Prussia's interference. In the mean time, the dignity of Mr Pitt's language, and the suddenness of his preparations, conspired, with the deranged state of the French finances, to intimidate that power from interfering farther, although very serious preparations by sea and land had followed her declaration of intending to succour the Dutch. In answer to the memorial of the Duke of Dorset, our ambassador at Paris, it was declared, that his most Christian majesty never had meant to interfere by force in the affairs of Holland, and that he agreed with pleasure to the proposal of his Britannic majesty for mutually disarming.

The present period of peace seemed to favour the growth of moral, as well as of physical prosperity in the country, and the session of 1788 was memorable for the first discussion that took place in parliament on

the subject of abolishing the inhuman African slave trade. By the unfortunate indisposition of Mr Wilberforce, the day appointed for that gentleman's motion for abolishing the traffic was passed, without his being able to fulfil his intention; but, at the suggestion of Sir William Dolben, some regulations for restraining the cruelties practised aboard the slave-ships were enacted, which were confirmed and extended during the subsequent year.*

Perpetual disputes having arisen, as had been foreseen and foretold between the two Indian boards of direction and controul, the minister thought proper to introduce his famous declaratory act, by which various new and important powers were conferred on the board of controul, under pretence of explaining the former. After this new act, not a doubt could remain, that the crown and the commissioners were invested even with superior powers of patronage over Indian affairs, to those which Mr Fox wished to have given to parliament in the bill which he proposed. The only difference was, that Mr Pitt had obtained for the crown an influence, which his opponent sought to gain to the representatives of the people, by a fair, single, and decisive measure.

On the 4th of November, the nation joined, without distinction of parties, in celebrating the centenary anniversary of the glorious revolution in 1688; but their attention was almost immediately called to a more melancholy object of public feeling. The king's health, which had for some time been declining, was affected with fever and delirium. This occasioned a suspension of the royal functions, for which the constitution, in all its fulness, had provided no express remedy. The analogy of the common law seemed indeed to point out the Prince of Wales as the natural successor to the throne during its temporary vacancy; and as the party now in opposition were avowedly the friends of his Royal Highness, a change, in every department of office, was likely to be the result of his majesty's continuing under the present affliction. Parliament met in November, but adjourned till December. On the 4th of that month, the important question of a regency began to be discussed. Mr Fox decidedly insisted on the right of the Prince of Wales to assume the vacant functions of royalty whenever parliament should pronounce it necessary that a regent should be appointed. Mr Pitt, with no less decision, pronounced the doctrine of the prince's right to the regency treason against the constitution, and contended, that the prince had no more a right to be elected than any other individual. It was retorted, with great severity by the opposition, that this was really to make the crown elective. If a stranger, said Mr Fox, were to ask, is your throne hereditary or elective? he must now answer, I cannot tell, I must ask the king's physicians,—if his majesty is well, it is hereditary; if he is unwell, it is elective. The revolution, it was contended by ministers, had conferred the crown by the election of a new prince; but it was answered, that the revolution was not a precedent for the regular

* When witnesses were examined at the bar of the House of Commons, on the subject of this horrible traffic, it appeared in evidence, that 5 feet 6 inches in length, and 16 inches in breadth, was the average space allotted to each slave. The lower deck of the vessel was entirely covered with bodies. The space between the floor of that deck and the roof above, in height about 5 feet 8 inches, was divided by a platform, also covered with human bodies. The slaves were chained, two and two, by their hands and feet, and by means of ring-bolts fastened to the deck. In that sultry climate, their allowance was a pint of water each *per day*, and they were usually fed twice a day with yams and horse-beans. After meals, they were compelled, by the whip, to jump in their irons; this was called *dancing*. They had not, as was emphatically stated, when stowed together, as much room, either in length or breadth, as a man has in his coffin.

progress of government, any more than the sick man's physic was proper during health. Nothing in the present circumstances made it necessary to break the hereditary line of succession. The case, though new, did not sanction a revolutionary reversion to the people, as the primary fountain of power. It was a case to be judged of by analogy—the sovereign was dead for the present in point of political capacity; and the hereditary nature of the government suggested no other successor than the lawful heir. The doctrine of Mr Pitt, however, prevailed in a parliament, whose zeal for the revolutionary doctrine of electing a regent, so much at variance with their principles on the public election of representatives, may be suspected of having been influenced by the hopes (that were never abandoned,) of his majesty's recovery. The question of the prince's right to the regency being decided, Mr Pitt, before he laid the full plan of the regency before the House of Commons, acknowledged the propriety of the Prince of Wales being elected to that office by parliament, and submitted to his royal highness the terms on which it was proposed that he should hold the regency. The answer of the Prince was temperate, but decided. He lamented, for the sake of the public, that those powers with which it was proposed to invest him, were such as degraded and divided the executive power; yet, that a conviction of the evils that must result to the nation from his refusal, would induce him to undertake the painful trust.

On the 16th of January, 1789, the whole plan of the regency was submitted to parliament. The prince was to exercise the regency during his majesty's illness, without being admitted to any share in the care of the royal person, or interference with the king's household and private affairs; he was to grant no pension nor reversion, and no office but what the law absolutely required for any other terms than during the king's pleasure, nor any peerage except on the royal issue. The persons attendant on his majesty, and the officers of his household in general, were to be under the exclusive controul of the queen. The disposal of one fourth of the civil list was thus put in the hands of her majesty, and indirectly retained for the strength of a party whom she was known to favour. During these events, his majesty continued chiefly under the care of Dr Willis, who, of all his physicians, had been the most sanguine in his opinion of his recovery; hitherto these hopes had been indefinite as to time. During the month of February they became more and more decisive.

Amidst circumstances so important to the general interests of the empire, the Irish parliament asserted their legislative independency, and voted an address to the Prince of Wales, beseeching him to assume the functions of royalty. The lord lieutenant having refused to transmit their address, the Irish peers and commons voted an unqualified censure on his conduct, and sent commissioners to London to wait on his royal highness; but this measure, and all others connected with the plan of regency, was rendered unnecessary by the recovery of his majesty, which was announced to parliament by the chancellor on the 10th of March. Innumerable congratulations reached the throne, from the peers and commons down to the humblest corporations; a solemn thanksgiving was celebrated through the kingdom; and in London his Majesty made a public procession to St Paul's, attended by both houses of parliament.

The business of parliament now returned to its usual channel. A supply of 218,000*l.* was voted for fortifying our West India possessions. Mr Fox, persevering in his efforts to obtain the repeal of the shop tax, was at last successful; and the prohibition of the poor pedlars was also abolished. The trial of Mr Hastings proceeded, but with no circumstance of memorable importance.

War had for some time raged on the eastern frontiers of Europe, between the powers of Russia and Austria leagued against the Turks. In this contest, the northern powers of the Continent found themselves at last involved, either as principals or arbiters. While Denmark allied itself to Russia, Gustavus of Sweden, allured by a subsidy from the Porte, and impelled by his ambition and hatred of Russia, had declared against the latter power, and sought, when it was too late, to conciliate the Danes. In September 1788, the Prince of Denmark invaded Sweden on the side of Norway, and advanced to Gottenburgh with trifling opposition. The governor of the place, and the inhabitants, terrified at the prospect of a siege, had determined to capitulate; but Gustavus riding thither with the speed of a courier, reached the place in time to save the capitulation, to displace the governor, and to animate the inhabitants with nobler sentiments. Gustavus assembled the townsmen; he reminded them of the ancient glory of the Swedish arms, and made them promise rather to be buried under the ruins than surrender. But from this dreadful trial of their fidelity, the inhabitants were saved by the timely interposition of England, Prussia, and Holland. Mr Elliot the British minister at Copenhagen, and Baron Borsche the Prussian envoy, threatened an immediate attack by sea and land on Denmark, if hostilities should proceed. An armistice was fixed, which ended in a treaty of neutrality, ratified in the course of 1789.

The party spirit of the nation had, for some years, assumed a milder aspect; and the questions which had been agitated between ministers and their opponents, though they furnished matter of zealous discussion, had neither involved universal enthusiasm, nor degenerated into personal rancour. But the progress of the French revolution began at this period to be viewed by the British nation with an eagerness, that seemed to re-awaken, upon the subject of foreign civil wars, all the collision of opinions which had engendered our own. The event was foreign, but the application of its principles came home to ourselves. By the genuine Tories of England, the French revolution, even as early as the period of storming the Bastille, was regarded as a horrible event, which would annihilate France as a power in Europe, and consign to similar anarchy and ruin every nation whom the contagion of her politics should affect. "France," said Mr Burke, when he commented on this event in parliament, "France is, in a political light, to be considered as expunged from the system of Europe. Were we absolute conquerors, and France to lie prostrate at our feet, we should blush to impose upon Frenchmen terms so destructive to all their consequence as a nation, as the durance they had imposed upon themselves." He was indignant that any Englishmen should approve of the French revolution, and astonished that they should compare it with our own. Ours was a revolution not made but prevented; theirs was a tempest of anarchy and bloodshed; the principles of the two events were as different as good and evil. Such were the sentiments delivered by Mr Burke, in a debate which took place on the 9th of February 1790, upon a

subject which would seem to have no direct connection with the French revolution : (on a question of the army estimates.) But the minds of men were full of this subject, and disposed to give vent to their opinions wherever publicity could be obtained. Mr Fox vindicated the principles of the great event, as entirely those which had produced our own revolution ; he hailed the emancipation of so many millions of men from tyranny, as a glorious era. France, it was owned, required a new constitution, and from whom had she to expect it ? From a king at the head of his courtiers ? From Broglio, at the head of the army ? From the dungeons of the Bastille ? or, from that spirit in the people which had laid the Bastille in ashes ? At this period, Mr Burke, Mr Windham, and some others, who had formerly sided with the opposition, now ceased to act with them ; but the opinions which Mr Fox had expressed, were supported both in and out of parliament by the generality of those who had maintained the doctrines of Whiggism. Of these arguments and speculations respecting the French revolution, so recent in the public memory, it is needless to give any account. As the tragedy of French affairs grew deeper, much of the sanguine hope of the triumph of liberty was diminished. But in justice to those who predicted that final triumph, let it be remembered, that as we recovered our rights after a Cromwell and two succeeding tyrants, so may France yet recover her's after Bonaparte and his successor. The followers of Mr Burke's speculation have certainly less reason to expect their prediction to be fulfilled, that France is to be expunged from the system of Europe.

On the 5th of May, a message from his majesty announced the serious intelligence of the prospect of a rupture with Spain. In 1788, a settlement had been made by some of our countrymen at Nootka Sound, on the western coast of America, about the 50th degree of latitude. The ground had been purchased from the natives ; it had never been visited by Spaniards. In the month of May 1789, two Spanish ships of war arrived in the Sound, and mutual civilities passed between the Spanish and British officers ; but, after a few days, the Iphigenia was seized by the Spanish commander's orders ; the officers and men were sent on board the Spanish vessel, put in irons, and conveyed to a Spanish port. Another British vessel was afterwards captured, the crews imprisoned, and the cargoes sold without formal condemnation. Taking possession of the settlement of Nootka Sound, the Spanish commander declared, in the name of his Catholic Majesty, that all the lands between Cape Horn and the 60th degree of latitude, belonged to Spain. When this affair was submitted to parliament, addresses were presented to his Majesty, and a vote of credit of one million passed without opposition. The British government now exhibited at once the firmness of its character in negotiation, and the vastness of its resources in immediate armaments.

By the family convention still subsisting between the houses of Bourbon, France was bound to co-operate with our antagonist ; and the national assembly, though intent on other matters, voted an aid of 14 ships of the line. But the court of Madrid plainly saw the reluctance of the French nation to enter into a war with England, and yielded to our demands, which were immediate restitution and indemnification. On the second of October, a convention was signed at the Escorial, by which every point in dispute was settled. The settle-

ment at Nootka Sound was restored, the free navigation and right of fishery in the southern pacific ocean were confirmed to Britain, and a free trade on the American coast to the north of the Spanish settlements, unaccompanied, however, by any formal renunciation of sovereignty on the part of Spain. On the other hand, neither of the two powers were to form a settlement nearer to Cape Horn than the most southerly of the Spanish settlements.

A new parliament met on the 25th of November. The first object of the minister was to provide for the expense of the armament against Spain, amounting to 4,000,000*l.* : he proposed to obtain a part of this sum by taking half a million from the unclaimed dividends in the bank of England. But this measure, which would have been a direct violation of the right of a chartered body, was ably and successfully opposed. The term *unclaimed dividends*, in reality meant, *unreceived dividends* ; for when the creditors names were afterwards published, numbers of claimants came forward, who had been ignorant of what the bank owed them.

The violence of political controversy on the subject of the French revolution had been kept alive by the mighty events still passing in France, and still more by the publications which issued from the presses of both countries. Among the works in our own language, which excited the strongest, though most opposite, sentiments of enthusiasm, were Burke's *Reflections* on the Declaration of the Rights of Man by the French National Assembly ; and the answer to that work by Thomas Paine. In this literary controversy, the most romantic and chivalrous principles of loyalty, and a style of eloquence dazzling, and often electrifying, were opposed to the surly republicanism and blunt declamation of the American school.

Soon after the winter recess, a bill passed for the relief of the English Catholics from the legal penalties still in existence ; a humane measure, but unnecessarily confined to such Catholics as should protest against the political authority of the pope. Mr Wilberforce's motion for the abolition of the slave trade, to the disgrace of the legislature, experienced a rejection.

Some salutary reformations in the practical laws of the country, engaged the attention of parliament. A bill, originating with the minority, was passed for securing the freedom of elections ; and another for prohibiting the attorney-general in the right of the crown, or any individual in his own right from disturbing a possessor in his franchise.

The most important transaction in the internal regulation of the empire regarded Canada. By a bill which Mr Pitt introduced, the constitution of that country was changed from the arbitrary form which it had received from France ; the habeas corpus act was introduced ; councils nominated by the sovereign, and houses of assembly chosen by the people, were established in the two governments of Upper and Lower Canada. The British parliament reserving a right of imposing only such taxes as were necessary for the regulation of trade and commerce, left the raising of *other* taxes, and the disposal of *all* taxes, to the respective principal legislatures.

War continued to rage on the eastern frontiers of Europe, between the Turkish, Austrian, and Russian arms. By the peace of Reichenbach, which was mediated (in August 1790) by the courts of London and Berlin, Austria had withdrawn from hostility against

the Porte; and elated by their success, the mediating courts now demanded of Russia to abandon her successful career against the Turks. The Empress Catharine haughtily replied, that she would make peace or war with whom she pleased, without the intervention of any foreign power. Not choosing, however, to provoke too far those self-created arbiters, she secretly intimated her willingness to conclude a peace with Turkey, on condition of retaining the country eastward of the Neister, a desert tract of territory, valuable only for containing the fortress of Oczakow. This offer being peremptorily refused, the empress broke off the conference, and determined to prosecute the war. On the 28th of March, Mr Pitt delivered a message from his majesty to the House of Commons, importing, that the endeavours which he had used with his allies, not having proved successful, his majesty thought it necessary, in order to add weight to his representations, to augment his naval force. In the debate which ensued upon this message, Mr Pitt enlarged on the necessity of attending to the balance of Europe, and on the influence of the Turkish empire in the general scale. Mr Fox, and the whole party of opposition, strenuously contended against the projected war. We had no quarrel, Mr Fox observed, with the Empress of Russia; we had no alliance with Turkey. It was the absurd pride of interference, that prompted us to hazard a war, which could only second the ambitious policy of Prussia, and never could promote our own interests, or those of Europe at large. The Czarina had offered to cede all her conquests, but a barren desert, containing one valuable fortress, Oczakow; and could it be seriously said, that the balance of Europe depended on Oczakow being possessed by the Russians or the Turks. The policy of a war with Russia on such grounds was so difficult to be perceived or defended, that though the minister still retained the majority of votes, they fell far below his accustomed numbers. Encouraged by the voice of public opinion, both within and without parliament, Mr Grey proposed a vote of censure on ministers, for their precipitate conduct respecting Russia; and the motion was negatived by only 80 votes. The minister was thus compelled to give way to popular opinion: he receded from his armed mediation, after a fleet had been equipped—advising and leaving Turkey to conclude a peace with the empress on the terms which she had proposed.

To divert the attention of the nation from the severe invectives on the failure and folly of this armed interference, Mr Pitt, at the next opening of parliament, (January 1792,) exhibited the most flattering and prosperous display of the national finances. The amount of the revenue exceeded that of last year by 300,000*l.*, and the whole surplus of the income over the expenditure was 900,000*l.*, leaving room to propose the repeal of some of the more burthensome taxes, and apply 400,000*l.* to the reduction of the national debt. Our exports had risen to 20,120,000*l.*; and our internal trade had increased in at least an equal proportion.

The same session was memorable for the success of a bill originating with Mr Fox, for giving juries a power of judging of the intention, as well as fact, in deciding upon libels. The bill had been introduced, and passed the commons the preceding year, but was rejected by the lords. In the same house, it still encountered severe opposition; the law lords, Thurlow, Kenyon, and Bathurst, pronouncing it a fundamental subversion of

English jurisprudence. Lord Camden and the Marquis of Lansdowne, with greater strength and liberality, contended, that the principle of the bill had been inherent in our laws and practice. Judge Jeffreys, himself, in all his devotion to an arbitrary court, had been of this opinion. To whom, said Lord Camden, should the judging of libels be confided, or to speak more properly, who were to guard the liberty of the press—the judges, or the people of England:—the juries were the people of England. In the fierce animosity of political opinions which had recently arisen, the one party made too forcible an use of the increasing horrors of the French revolution, to discountenance all reform in our constitution; while there was evidently, on the other, a spirit of lawless disaffection, cherished by a class of the British public, who were infected by the republicanism of France. Professing to raise a barrier at once against the licentiousness, and a popular bulwark in favour of reform, a society called the Friends of the People, was formed. In such a mixed society, it may be difficult to pronounce upon the general wish; but of the leaders of this society, many were unexceptionable, and some were distinguished political characters. One of them, Mr Grey, gave notice of his intentions to move, as formerly, for an inquiry into the state of the representation: his views were vehemently opposed by the minister, as well as by a majority of the people. Reform, in every shape, was now deprecated by that party as the pretext of revolutionists, and the certain precursor of the subversion of the constitution. In a royal proclamation against seditious writings and principles, which soon after appeared, the magistrates were exhorted to vigilance, and the people to obedience; and loyal addresses of answer to the proclamation, by both houses of parliament, were transmitted from every part of the kingdom. Amidst this fear of the infection of French principles and cruelty, the horrors and disgraces of the slave trade were not suffered to be erased from our own name as a nation. The motion, renewed by Mr Wilberforce, for abolishing that iniquitous traffic, was rejected in the Lords, even though softened down by the amendment of Mr Dundas for a gradual abolition.

Before we take a view of those affairs, in Europe, which eventually dispelled all the pleasing hopes of peace and prosperity, so lately held out in the language of the throne, it is necessary among the events of the present year, to notice the affairs of India. Tippoo Saib had concluded a peace with the East India company, in 1784; but, within a few years, a dispute with the Rajah of Travancore, respecting two forts which the Dutch had sold to that potentate, but over which Tippoo claimed a feudal sovereignty, involved the company, as allies of the Rajah, once more in hostilities with Tippoo. The war, which was renewed in 1790, was this year terminated with signal success. In February, Lord Cornwallis had invested Seringapatam, the capital of the Sultan's dominions, and the prince's affairs seemed so desperate, that he consented to peace, on terms dictated by the conqueror. These were, that he should cede one half of his dominions to the British and their allies; pay about 4,000,000*l.* sterling, to indemnify their expences in the war; release all prisoners, and deliver his two sons as hostages for the performance of the treaty.

Before the news of these distant triumphs reached us, the affairs of Europe were become dark and portentous. On the 20th of April, war was declared by the French National Assembly, against the king of Hun-

gary, the title of Emperor being yet vacant by the death of Leopold II. In July, the combined armies of Austria and Prussia entered France, under the command of the Duke of Brunswick, preceded by that dreadful manifesto, in which they threatened to punish the French nation as rebels, and give up Paris to military execution, unless the king and royal family were set at liberty. For two months, the advance of the Duke of Brunswick, though conducted under many unprosperous omens, was unchecked; but, on the 20th of September, Dumourier repulsed him on the heights of Walmy, and his army, thinned by disease and famine, began their retreat. Before the close of the year, not only had the French dominions been evacuated; but the whole of the Austrian Netherlands, Luxembourg and Liege excepted, were overrun by the republican invaders.

In the mean time, the Parisians, alike ferocious in their fears and in their triumphs, had signalized the 10th of August and the 1st day of September, by massacres, at which the heart freezes in the recital, on pretence of the danger which was threatened by the approaching invaders. In November, the convention, intoxicated by the repulse of the hostile armies, passed their famous decree for fraternizing with all nations in pursuit of liberty—for annexing the Duchy of Savoy to the republic,—and for opening the navigation of the Scheldt. The event of the 10th of August, by which royalty in France was abolished, was deemed sufficient grounds by the British court for recalling our ambassador. The French ambassador, though no longer acknowledged, remained in England. The fraternizing decree of the convention, and the decree respecting the Scheldt, occasioned an offer of our assistance to be made to the States General; an embargo to be laid on all vessels freighted with corn to France; and preparations for war by land and sea.

The substance of his majesty's speech when parliament next assembled, December 13th, was to declare the necessity of putting the nation in a posture of defence against internal disaffection, and external hostility. The usurping government of France, it was declared, had shewn their contempt of the rights of neutral nations by their obnoxious decrees; they had in particular invaded the rights of our allies, the Dutch, in their decree for opening the navigation of the Scheldt.

War seemed now inevitable, yet France still held out the appearance of wishing for conciliation. M. Chauvelin, waving the ceremony of his being recognized at our court, informed Lord Grenville, in the name of the executive council of the French nation, that France would not attack Holland while she preserved her neutrality; and that the fraternizing decree had no reference to England.

With regard to the opening of the Scheldt, Chauvelin argued, that his country having rescued Belgium from the yoke of Austria, was bound to restore to the Belgians all their rights, of which they had been deprived. The navigation of the Scheldt was certainly one of these. How could the right respecting the Scheldt be excepted? particularly when it was of importance only to those who were deprived of it. The English government, after some discussion with Chauvelin, notified, that their conditions of peace were, that France should renounce her views of aggression, relinquish her conquests, and confine herself to her own territory. France had already conquered the Netherlands, yet it seems to have been expected, that she should quietly give them up.

The fate of the unfortunate Louis XVI. which had been for some time anticipated, occasioned the immediate dismissal of the French resident from London. It contributed, with the other horrible transactions of France, to rouse sensations of pity and indignation, which violently disposed the people of England for war.

Since the opening of the session in December 1792, the question of peace or war had been the subject of successive debates. On the 12th of February, a message from his majesty announced, that France had declared war against Great Britain and the Dutch. Mr Pitt read this declaration of war, and endeavoured to justify the British government from its individual charges.—“The king of England was accused of having favoured the coalition. Mr Pitt solemnly denied the charge. His majesty had recalled his ambassador from Paris after the 10th of August; but it was,” said the minister, “because the government of France was from that day a government of usurpation. Chauvelin's letters of credence had been refused; but not until the French had offered repeated offences. We were taxed with framing the alien bill; it was a measure of self-defence against foreign incendiaries. The French accused us of prohibiting corn, arms, and ammunition, from being exported to France; that too was a measure of self-defence against the designs of France, avowedly shewn in her treatment of Holland. We had prohibited the influx of assignats; in so doing we had only shielded ourselves against a gigantic system of swindling. Lastly, we were accused of having prepared an armament to disturb the French operations in Belgium. True,” said the minister, “we armed in our own defence when France shewed contempt of our allies; but we sought *not* to disturb their operations in Belgium, we meant to protect Holland.”—He concluded by moving for an address to support his majesty in the war.

Mr Fox opposed the address, because it pledged the house to an indefinite sanction of the past and future conduct of ministers. He proposed as an amendment to the address, that the house should promise to support the throne, in bringing France to such terms of pacification, as should be consistent with the honour of his majesty's crown, the interests of his people, and the security of our allies. The causes of war alleged by France, he did not pretend to justify indiscriminately. It had been customary with France, even under her ancient government, to crowd into a manifesto every complaint, solid or insignificant, which could be mentioned as grounds of hostility: but the dismissal of Chauvelin, and our prohibiting the exportation of corn to France, (in violation of the treaty of 1786,) when a supply of grain was permitted to other countries, did not warrant us to say, that the war was pure aggression on the part of France. Mr Fox severely censured the conduct of ministers, in refusing to send an ambassador to France. Had our conduct been more candid and conciliating, the fate of Louis, as well as the war, might have been averted. But the minister negotiated unofficially. What benefit could arise from this strange distinction between official and unofficial negotiation, Mr Fox could not conceive; but had we negotiated, (he would ask,) with a real and conscientious wish for peace? No; we remonstrated against accessions of territory, and we complained of the violated rights of our ally, but we proposed nothing that we could rationally expect to be conceded as a satisfaction. We pointed out nothing that could remove the alarm. We told them to abandon their con-

quests—to withdraw their troops from the Netherlands. While they were at war with the emperor, such a proposal was not an offer of peace. It was an insult, and a pretext for quarrel. The invasion of our ally, by the opening of the navigation of the Scheldt, was set forth as the grounds of war; but was this exclusive navigation really an object worthy of a war? Did the state's general think it such? had they asked for our assistance? had they determined to assert their right to the Scheldt by force of arms? No, they had not! How then could we take the lead, in asserting a claim in which we were not principals, and in which the principals did not call for our interposition. As to the satisfaction which we sought, viz. the restitution of Belgium, it was evidently and wholly impossible to be admitted. We made a pretence of the balance of Europe to justify going to war, but had we not seen France invaded, her frontier town taken, and her capital threatened, without speaking of the balance of Europe, or interfering to preserve it. Now, when France had repelled invasion, we discovered that Europe was in danger. This was the language of men devoted, not to the preservation of peace, but to the coalition against France.

In the mean time, the war was carried on, on the continent, by the allied powers formerly engaged, with various success. The French, under Dumourier, entered the Dutch territory on the 17th of February, and Breda, the fort of Klundert, and Gertruydenburgh, surrendered to their arms; but at the city of Williamstadt they first received a check. The English troops under the Duke of York having debarked in Holland, entered Williamstadt; and this circumstance, with other concurring events, turned the tide of fortune in favour of the allies. The successes of the Imperial commanders, Clairfait and Cobourg, were at first equally illustrious. The latter obliging Miranda to raise the siege of Maestricht, repassed the Maese, and defeated Dumourier, in two severe encounters at Neerwinde and at Fer de Louvain. The French now retreated from Belgium, pursued by the vengeance of the inhabitants. The defection of Dumourier left the French army in a state of imminent peril, from which the genius and courage of Dampierre, with difficulty, recovered it. But that enterprising commander, advancing from his camp at Famars, attacked the allies at Quiverein, where he was defeated with the loss of 4000 men, and where he himself fell in the action. In this engagement, the English and Hanoverians turned the fortune of the day: the Coldstream guards were particularly distinguished by charging the foremost lines of the French. By this success, the allies were enabled to besiege Valenciennes, which surrendered on the 25th of July. Mentz and Condé, about the same time, capitulated to the confederates. While so important a mass of the allied forces kept together, nothing could withstand their efforts; but unhappily they divided, entertaining different views of aggrandizement. The British, under the Duke of York, forming a distinct army with the Dutch and Hessians, opened the trenches before Dunkirk on the 24th of August. The works were carried on, though with trivial effect, till the sixth of September, when the covering army, commanded by the Hanoverian Field Marshal Freytag, was unexpectedly attacked and defeated by the French General Houchard; a successful sortie was at the same time made by the garrison, and the besieging army was compelled to retreat with the loss of all its heavy artillery. On her own

element, Britain began the war with success. Tobago was captured by a British squadron under Admiral La Forey. The settlements of Fort Jeremie, and Cape St Nicholas Mole in St Domingo, also surrendered to our arms. The small islands of Miquelon and St Pierre became an easy prey to our arms; and, in the East Indies, we became masters of Pondicherry, Fort Mahic, and other settlements of the French on the Malabar and Coromandel coasts. A fallacious hope, for a short time, shone upon the affairs of the allies, that the internal distractions of the French would afford them effective partisans in restoring the monarchy. After the fall of the Girondine, (the less ferocious faction of the republicans,) and the ascendancy of the terrorists, some of the proscribed deputies fled from Paris, and raised the standard of insurrection in the provinces. In the south, a most formidable federation against the Jacobins was framed by the three cities of Marseilles, Lyons, and Toulon. Lord Hood was at that time cruising in the Mediterranean, and with him the people of Toulon and the French Admiral Trugoff negotiated to surrender the town and the shipping. His Lordship took possession of both in the name of Louis XVII. solemnly engaging to assist in restoring the constitution of 1789. The siege of this place was immediately commenced by a large army of the republicans, with all the advantages of having the adjacent country subjected, although not devoted, to their cause. General O'Hara, who had reinforced the garrison with troops from Gibraltar, was wounded and made prisoner in a sortie, the neighbouring forts were carried by the enemy, and the town was bombarded and found untenable. Thousands of the inhabitants who crowded to the shore, were taken on board the English ships; but many more thousands were necessarily abandoned to the cruel vengeance of their countrymen. Of 15 French ships of the line which had surrendered to Lord Hood, only three were brought off.

The session of parliament of 1794 was opened on the 21st of January. As the avowed object of the war had been the deliverance of our allies, and security for ourselves, the ministry were called upon, by their opponents, to explain why they had suffered a period of time to pass over, when the arms of the allies were every where victorious, without endeavouring to profit by success, and to restore the blessings of peace. "The present war, (said his grace the duke of Grafton, in seconding a motion of the marquis of Lansdown, for addressing his majesty to make a pacific attempt,) was undefined in its principle and object. It was a war of extermination, which, if continued upon the present principles, would convert France into a great military school; it would rouse her utmost enthusiasm, and ultimately shake the prosperity and safety of these kingdoms." To these almost prophetic predictions, and to other views and arguments, strongly urged during this session by Mr Fox and Mr Whitbread, the answer of ministers was in substance: That though security was the object of the war, they would not bind themselves to define the circumstances which might be allowed to constitute that security; that the war held out every probable hope of success; that France was on the eve of bankruptcy, and could not long resist the allied powers; and finally, that, with a seditious faction at home, and a foreign enemy, bent on subverting our monarchy, we could not expect refuge from danger, even in peace, nor were peace itself desirable and safe, could we treat with such men as the present governors of France. The public in

general received implicitly those views of success in the war. They listened to the descriptions which ministers gave of the dangerous conspiracy hatched by the reforming societies. Parliament was induced to suspend the habeas corpus act; and twelve of the reforming leaders were arrested for high treason. Of these, John Horne Tooke was the only man of the smallest political distinction. Hardy, a shoemaker; Thelwall, an itinerant lecturer; Holcroft, a play-writer; and others of less note, were his associates. They were indicted at the Old Bailey. It was sought to be proved, that the associations in question had armed themselves against the government; but it was only proved, that a few of the individuals had procured some pikes to defend themselves against the mobs at places where they held their meeting. Hardy was first tried; and after a trial of nine days, acquitted. Never was a verdict considered as more important to public liberty; and the eloquence of Erskine never brought more reputation to himself, or on the legal profession, than on this occasion. The verdict in Hardy's case clearly predicted the acquittal of the other reformers.

Some of the late members of opposition, who had left their party on the breaking out of the war, were this year admitted to a share in the administration. Earl Fitzwilliam was appointed president of the council; earl Spencer, lord privy seal; the duke of Portland, third secretary of state; and Mr Windham, secretary at war. By a subsequent change, lord Spencer was appointed to the head of the admiralty, and lord Fitzwilliam was made viceroy of Ireland.

The military and naval force voted for the service of the year, amounted to 250,000, including 35,000 foreigners. A great augmentation of the militia, and of the volunteer fencible corps, took place; and the doubtful expedient was resorted to, of soliciting voluntary subscriptions by a formal letter, written by the secretary of state to the lords lieutenants of the counties. A treaty was concluded with the king of Sardinia, by which that monarch received a subsidy of 200,000*l.* a year from this country; and it was agreed, that his Britannic majesty should not conclude a peace with France, without the restoration of the conquered territories of Sardinia being made a preliminary. By another treaty, his Prussian majesty was to maintain 62,000 men, on condition of receiving from Britain 150,000*l.** a month, besides 400,000*l.* when his army should be put in motion, and 100,000*l.* on their return. But the direction and command of these costly auxiliaries was still to be vested in his Prussian majesty. On the 9th of April, his majesty the emperor of Germany arrived at Brussels, to take the supreme command of the allied forces. On the 16th, he reviewed them on the heights above Cateau. The following day the allies proceeded to invest Landreci, which fell into the hands of prince Cobourg after a siege of no long duration. But to balance the success, Pichegru drove the army of Clairfait from Moucron, and the republicans got possession of Menin and Courtray. In June, the French, under Jourdan, having passed the Sambre, and laid siege to Charleroi, the prince of Cobourg risked a general attack. The scene of the important battle which ensued was at Fleurus, memorable for the total defeat of the allies. Charleroi and Brussels thus fell, without resistance, into the hands of the French. This was but the prelude to a succession of

victories on the side of the enemy. Ypres, the key of West Flanders, yielded to Moreau. The duke of York had fatally separated from the confederates, and stationed himself at Tournay, which he soon found untenable, and retreated in the direction of Antwerp. When the fate of the Netherlands had been thus decided, a body of 10,000 men under lord Moira, which landed at Ostend, with difficulty reached the British army; but the tide of the war was too strongly turned, to be affected by so small a reinforcement. Ostend, Ghent, Mons, Oudenarde, and Neuport, fell in rapid succession into the hands of the republicans, and the whole line of the allies, from Antwerp to Namur, became broken and defenceless. The Stadtholder in vain called on his states to support him by a general levy: disaffection or apathy every where prevailed. Sluys alone made a brave resistance. In the mean time, the strong towns in the French territory, which the allies still possessed, being now completely insulated, quickly reverted to their former possessors. The army of the duke of York retreated in August to Breda, and quickly after to Bois le Duc. Pursued by Pichegru at the head of 80,000 men, they next retreated across the Maese, took a fresh position near Grave, and at the beginning of October encamped under the walls of Nimeguen. At the latter end of the month they crossed the Waal, leaving a corps to protect Nimeguen; but the town was evacuated on the 7th of November, with great loss and confusion. During these events, the arms of the republic were equally successful in all directions. Clairfait, after successive defeats, was obliged to cross the Rhine at Cologne, and the imperial troops were pursued to the river side by their conquerors. On the side of Spain and Italy, the French armies shared similar triumphs, and victory, to use the language of Barrere, was in a state of permanence.

Amidst these disasters by land, it was some consolation that our navy supported and even exceeded its former glory. By this naval superiority, we were enabled to capture the islands of Martinique, St Lucia, and Guadaloupe, although the last of these conquests was soon after recovered by the French. In February, the island of Corsica, where a great proportion of the inhabitants, under their ancient chief Paoli, were in arms against the French convention, was visited by lord Hood's squadron, and, in a short time, the whole island submitted to the English and their Corsican adherents. In June, the representatives of the whole nation assembled at Corte; voted the union of the island with the British crown; and a constitutional act was framed, almost exactly similar to the French model of 1791. Sir Gilbert Elliot (since lord Minto,) assumed the power and title of viceroy.

In the month of May, the French Brest fleet under admiral Villaret, anxious for the fate of a large convoy from America, ventured to put to sea; though it was known that lord Howe, with an equal force, was cruising off the harbour to intercept it. Early on the 28th of May, the grand fleets of the two nations came in view of each other, and on the first of June, after lord Howe had, by a series of masterly manœuvres, gained the weather gage, they came to a close and desperate conflict. After suffering immense carnage, the French admiral crowded off, and was followed by all the ships in a condition to carry sail. Six remained in possession of the British; but the French consoled themselves

* The states general of Holland were to pay 40,000*l.* of this as their proportion.

with reflecting, that they had saved a convoy of 160 merchantmen, valued at many millions.

The brilliant successes of France by land, had, by this time, rendered most of the neighbouring powers disposed to acknowledge her new government, and some of them even to court her alliance. The grand duke of Tuscany, at the beginning of 1795, deserted the coalition. Prussia having received our subsidy, which she applied to accomplish the infamous partition of Poland, soon followed the same conduct, concluded a treaty with the French, and mediated a peace between the republic and the Landgrave of Hesse Cassel. Yet amidst all these unpromising events, the speech from the throne, at the opening of the next session of parliament, exhorted a strenuous continuation of the war; and every motion advanced by the opposers of the war, was negatived by triumphant majorities. In these debates, however, several accustomed supporters of the minister, sided with the pacific party in the commons; and Mr Wilberforce, announcing a total change in his views of the necessity of the contest, took the lead in proposing a negotiation. A loan of 4,600,000*l.* was guaranteed by parliament to the house of Austria. The force voted for the year amounted to 100,000 seamen, and 216,000 regular soldiers and militia, exclusive of fencibles and volunteers, and embodied French emigrants. The sums levied for the service of the year, and the payment of the national debt, rose to 40,000,000*l.*; nor was our expenditure in Ireland, and the East and West Indies, taken into this account.

The trial of Mr Hastings, so remarkable for its importance, for the talents of its conductors, and for the length of its duration, was, in the course of 1795, brought to a conclusion. He was acquitted of every branch of every charge, distinctly and severally.

In the month of April, were celebrated the nuptials of his royal highness the prince of Wales with the princess Caroline, daughter of the duke of Brunswick. The annual revenue of the prince was, after some agitation, settled at 120,000*l.*, exclusive of the rents of the duchy of Cornwall, estimated at 13,000*l.* Of this income, 73,000*l.* were appropriated to the liquidation of his royal highness's debts, under the direction of commissioners appointed by parliament. For some time, the attention and fears of government had been roused by the importunate and impatient clamours of the Catholics of Ireland, at the restrictions which still continued to gall that numerous class of subjects. Baffled in their applications to the Irish parliament, the Catholics had met over the whole kingdom, and addressed the sovereign himself in a determined and energetic manner. Ministers, who were embarrassed between the force and justice of those claims, and their wishes to retain the attachment of the high church Protestants in Ireland, who opposed the Catholic emancipation, seem to have adopted a momentary resolution of complying with the demands of the former party. Earl Fitzwilliam was appointed to the government of Ireland. His inclination to healing measures, rendered his appointment universally acceptable to the Irish. The depressed influence of the Whig Protestants, the friends of emancipation, rose in the Irish parliament; and a bill for the relief of the Catholics, drawn up by the accustomed advocates of their rights, was introduced into the Irish commons with little opposition. But the joy and conciliation occasioned by this event, quickly vanished. Earl Fitzwilliam, as a necessary step to the measure of emancipation, had

VOL. IV. PART II.

been obliged to dismiss some of the most zealous of the anti-catholic friends of ministers in Ireland. Indignant at this change, Mr Beresford repaired to London, and held conferences with the British cabinet, which induced a total change of measures. The popular viceroy was recalled, and lord Camden sent in his place. The Irish parliament, after having voted with enthusiasm an approbation of all the measures of the preceding deputy, now rejected the bill in favour of their Catholic countrymen, and contributed, perhaps, to foster the seeds of a rebellion, which afterwards deluged the country with blood.

The retreat of the allies through the Netherlands and Holland, had become unavoidable at the close of 1794. From the latter country, the stadtholder and his family made their escape in an open boat, and arrived in England. The whole country followed the example of the Dutch capital in submitting to the French. The departure of the duke of York for England, had, in the mean time, appeared as a signal, that the British despaired of preserving Holland. The shattered remains of our army, during a dreadful winter, retreated through Holland towards Bremen, which they reached in the month of March, after experiencing incredible hardships, and after having traversed, or rather fought their way across the provinces of Utrecht, Guelderland, Overysel, and Groningen. The campaign of 1795 was, however, much less disastrous to the allies in other parts of the continent, than that of the preceding year. By a severe defeat which the French sustained on the Rhine, they were driven to seek shelter under the walls of Mannheim, and were obliged to raise the siege of Mentz. Both Jourdan and Pichegru were driven back from the Rhine; the imperialists recovered the Palatinate; Mannheim was reconquered; and at the end of the campaign, the Austrians had been so successful as to form the project of attacking Luxembourg.

The declaration of the Dutch republic, in favour of France, was thought to justify Britain in making reprisals. In the course of the summer, their valuable settlement at the Cape of Good Hope, surrendered to Admiral Elphinstone.

In the month of June an unfortunate descent was made in the bay of Quiberon, by an army of some thousand emigrants, who were debarked from a British squadron under sir J. Borlase Warren, and who, it was vainly hoped, would revive the spirit of royalty, so lately crushed in La Vendée. But their force was suddenly surprised by the republican forces of Hoche. Their leaders, among whom were the venerable bishop of Dol, and the gallant and young count Sombreuil, were consigned to military execution; and about 60,000 stand of arms, intended for the expected associates in the cause of royalty, fell into the enemy's hands.

The naval events of the year were not important. In March, an indecisive engagement took place between our fleet in the Mediterranean, under admiral Hotham, and the French, under admiral Richery, in which the enemy lost two ships of the line. In the month of June, admiral Cornwallis, with only five ships of the line, maintained a running fight, for a whole day, with 13 sail of the enemy's line, without suffering them to gain any advantage. The same ships of the enemy fell in with lord Bridport's fleet, and were defeated off Port L'Orient, with the loss of three first rates. In the West Indies, the French recovered Fort Tiberon, in St Domingo, and the islands of St Eustatia, and St Lucia.

4 M

The war, although supported by a powerful party in the country, was, by this time, become extremely unpopular among the lower community. A scarcity, at the same time, prevailed throughout the kingdom; and such was the state of the poor, that some wretched individuals had died of hunger. In this state of discontent, the multitude, while they demanded the real blessings of peace, were also clamorous for the visionary blessings of annual parliaments, and universal suffrage; and the associations formed for the latter objects, had grown exceedingly bold and licentious.* Parliament met on the 29th of October 1795, a day remarkable for the disagreeable events attending it. His majesty was beset by a furious multitude, in passing from St James's: a stone was thrown into the state coach, and the interposition of the horse guards was necessary, to preserve his person from the insults of the mob. Ascribing this ebullition of popular fury to the inflammatory influence of the reforming associations, ministers introduced into parliament two bills, which struck at the meeting of the disaffected, and enlarged the treason law, and enacted severer punishments for sedition. The first of these bills, which passed the peers, at the instance of lord Grenville, the pains of death were attached, not merely to the actual conspiracy against the king, but to the guilt of speaking or publishing what might tend to produce rebellion. By the other bill, which Mr Pitt carried through the commons, a right was given to magistrates to disperse, at their pleasure, any meeting suspected of seditious objects. The term of three years was prescribed to the duration of these acts. The financial business of the session necessarily included the imposition of fresh taxes: the most important of these was one on legacies, and an addition of 10 per cent. to the already assessed taxes. One hundred and ten thousand seamen were voted for the year 1796, and two hundred and seven thousand men for the land service. A loan was negotiated for 18 millions, and afterwards for seven millions and a half.

The first declaration of a pacific disposition was now made by the British ministry, in the fourth year since the commencement of the war. The destruction of the Jacobins, and the return of a comparatively mild and humane system in France, had, for some time, taken away the difficulty of having no government, with whom we could treat. On the 8th of December 1795, a message from his majesty announced to parliament his willingness to meet any negotiation on the part of the enemy; and Mr Pitt, in consequence, obtained a vote of the commons, that Great Britain *might* now safely treat with France. It was objected, by his opponents, that this cold and general declaration was altogether inexpressive of a real determination, that ministers *would* open a treaty. The minister, however, could pledge himself to no specific promise on the subject. A commission was given to Mr Wickham, our agent at Basle, to sound Mr Bartholemi, respecting the willingness of the French government to come to terms; but the declaration, on the part of France, that she never would concede Belgium, put an immediate termination to the affair.

Mr Wilberforce's annual motion, for abolishing the slave trade, was lost for want of numbers to constitute a house. A humane attempt, by lord Moira, to obtain a bill for the relief of insolvent debtors, met with no better success. The session was closed on the 19th of May,

and, in a few days afterwards, parliament was dissolved.

On the continent, this year was signalized by the most awful and interesting fluctuation of fortunes, between the arms of France and our allies. On the side of Italy, it is true, there was no fluctuation of success. The career of the enemy was uniform. Sardinia, Parma, Modena, and Genoa—the pope, and the king of Naples, were reduced to implore and purchase peace, by immense sacrifices, in consequence of the victories of the French, obtained by a commander, (Bonaparte) young, and hitherto unknown in the world; but who has since chained the history of the age to his biography.

In Germany, the campaign began successfully on the side of the French. Moreau and Jourdan, superseding Pichegru in command, penetrated to the very heart of the empire. Moreau, after successive victories, forced the Elector of Bavaria to sue for peace; while Jourdan, taking the route of Upper Suabia, had penetrated to Amberg, and even stretched his lines to the neighbourhood of Ratisbon. At this critical period, the fortunes of Austria were restored by the gallantry of the Archduke Charles, who attacked the van of Jourdan, and following up the success by repeated blows, pursued the invaders back to the Lower Rhine. Moreau was compelled to retire by the fall of the army on his left, and pursued for 300 miles, a most skilful and memorable retreat, in the face of a superior enemy. On the 2d of August, a most valuable and bloodless conquest was made of nine Dutch ships, which had been sent by that enemy to recover the Cape of Good Hope. Their commander, Admiral Lucas, terrified by a mutinous spirit among his crews, yielded the fleet (without firing a shot) to the summons of Admiral Elphinstone. The Dutch possessions in the East Indies, including their settlements in the island of Ceylon, fell about the same time an easy prey to our arms. St Lucia was recovered by General Abercromby, and a formidable insurrection of the negroes was quelled in Grenada and St Vincent's. Whilst the successes of Bonaparte in Italy, and his fame among his countrymen in Corsica, inspired the Gallic faction in that island, a body of French, under General Cazette, arrived to co-operate with the natives. They drove our troops from Bastia, and obliged the viceroy and the fleet to take a final leave of the island.

The series of warlike events in this year, was concluded by the most formidable effort that was ever made by France in the course of the century, to invade these dominions. On the 2d of December, fifteen thousand chosen troops, intended to act with the disaffected in Ireland, were embarked at Brest, accompanied by eighteen sail of the line, and a number of frigates. But of this armament, which was overtaken and dispersed by a storm soon after it had put to sea, only eight two deckers reached the coast of Ireland. They appeared off Bantry Bay, but were forced from that station by another tempest, narrowly escaping two squadrons of our navy. They returned to France with the loss of several ships of the line.

As the feeble and ineffectual attempt of Mr Wickham to open a treaty for peace, had not gained to ministers much credit for pacific intentions, a more direct negotiation was opened some months after, and Lord Malmesbury was sent ambassador to France. His plan of pacification, however, made the cession of Bel-

* That which was held near Islington, at Copenhagen House, was computed to collect, at one time, 40,000 individuals, but the most of them were mere spectators.

gium to the emperor an indispensable preliminary ; and on declaring that he was empowered to treat on no other terms, his lordship was ordered by the Directory to depart within forty-eight hours. His stay in Paris did not exceed two months, during which time the Court of Madrid issued a proclamation of war against Britain.

The minority in the next session of parliament, made the severest animadversions on the conduct of Lord Malmesbury's negotiation. Mr Fox did not hesitate to accuse the minister of insincerity in the whole affair. We had proposed to France that she should cede the Netherlands, when we well knew that France would consent to no such proposal. "The war," he said, "was now evidently maintained for no other object than recovering Belgium." The pacific motions of the opposition were, as before, overturned by large majorities.

After the failure of the negotiation, the mutual language of the French and English governments breathed irreconcilable hatred. The French uttered, as usual, their unmeaning threats of invasion. The English ministers, anxious to unite the people, by fear, if not by love, favoured and propagated the rumour ; but, from the universal panic, some consequences followed, which the government neither wished for, nor intended to produce.

On the prospect of invasion, the people had been exhorted, but in vain, not to be moved by a false alarm, or give a blow to public credit. The diminution of gold became greater and greater every day. The run upon the bank continued to increase until the 25th of February, a day that will long be memorable, as the last on which the Bank of England was compelled, at the will of the bearer, to pay its promissory notes in gold and silver. Till the evening of the 25th, the run continued ; but, on the next day, though it was Sunday, an order was issued from the privy council, requiring the directors of the bank to forbear issuing any cash in payment, until the sense of parliament could be taken upon the subject. A great crowd of people, who had assembled on Monday morning, as soon as the doors opened, were presented with hand bills, announcing the authority by which the stoppage had been sanctioned.

The resemblance of this stoppage to actual bankruptcy, occurred to many persons who were not versed in the modern science of distinctions. But the friends to ministers boldly denied what they were pleased to call the false notion, of the bank being unable to make their payments in gold. They said, that it was a great measure of state, produced by the caution of the minister, that too great a drain of gold should not be made. They accused the Jacobins of having caused a distrust of the bank, and of having formed a design to ruin the credit of the country, by persuading the people that gold was preferable to bank notes. It is with pain that we notice the well-intentioned mind of Wilberforce himself, led away by this senseless clamour. In the first debate upon the subject, he attributed much of the public calamity to the conduct of the opposition. In answer to this, Mr Fox said, that it reminded him of a scene in Ben Jonson, where it appears, that an im-

postor had played his tricks very successfully for a long time upon his dupes ; and when he was detected, the dupes became very angry, not at the impostor, but those who had detected him. The consequences which have since resulted from the order to stop bank payments in cash, the depreciation and the deluge of paper currency were then predicted ; but, being Jacobin predictions, it was resolved, that they should not be believed.* The fact, of the bank directors having sheltered their stoppage under an order of the privy council, however glaring, was most shamefully denied by the directors. Several days before the bank stopt its payments, the directors, observing with great uneasiness the large and constant decrease in their cash, held a particular consultation on the subject ; and perceiving that their cash was reduced to a certain sum, they came to a resolution to go to Mr Pitt, and tell him how they were circumstanced. They did so ; and Mr Pitt, seeing that the peal of alarm about invasion, which it had suited the views of ministers to ring, had produced more serious effects than he had foreseen, observed, that the alarm of invasion was now become much more general than he could see necessary. They then pressed Mr Pitt to make some declaration in parliament, which should ease the public mind. On the 24th of February, they had another interview with Mr Pitt. In a report by a committee of their whole court, it was declared that the cash was going ; which gave such an alarm for the safety of the house, that no time was lost in sending a deputation to Mr Pitt, to ask him how far they might venture to go in paying cash, and "when he would think it necessary to interfere."

On the 27th of February, Mr Pitt gave notice of a motion to be made next day, for the appointment of a committee to inquire into the solvency of the Bank, and also to inquire and report as to the necessity of continuing to prohibit their money-payments. The opposition members strongly contended for an inquiry into the causes of the necessity of this measure. Here, they said, is an open acknowledgment, that the government has been obliged to interrupt the right of the subject, the right of the holders of notes, to demand payment in gold and silver, yet a remedy is attempted, without examining the cause of this evil. Their motions for full inquiry shared the general fate of the proposals of the same party. A committee, chosen by the ministerial party, was appointed, for the object, as Mr Pitt said, of ascertaining that the affairs of the Bank were not in a dangerous state. They were not, he added, by any means called upon to push their inquiries into circumstances, the disclosure of which would be attended with temporary injury to the credit of the country, and with permanent embarrassment to the operations of the Bank. This secret and delicate committee seemed, indeed, to understand the lesson that was set to them : they made no inquiries about the quantity of gold and silver in the bank ; they only compared the bank notes of their creditors with the money that was due to them by government. When the reports of this committee were brought up,† which Mr Pitt called highly consoling, the ministers assumed a high tone.

* Mr Sheridan said, that he was convinced, that if the bank was not able to resume its payments immediately, he foresaw it never would be able afterwards to defray its outstanding engagements in cash. The suspension of cash payments, he predicted, would produce the issue of a much greater quantity of paper.

† The first report of the committee, March 3d, 1797, was as follows : Your committee have examined the total amount of outstanding demands on the Bank of England, and likewise of the funds for discharging the same, and think it their duty, without loss of time, to state those total amounts, and to report the total result thereof. Your committee find, upon such examination, that the total amount

Lord Hawkesbury spoke exultingly of paper. It is not only, said his lordship, a cleaner, neater, and more portable medium to represent property, but it is the essence of wealth itself. The flourishing state of our commerce, is the cause of this inability to produce specie to answer the demands upon the Bank of England. Mr Sheridan called upon gentlemen, if this was the case, to explain how it happened, that the public were of this opinion, and yet rejected it. The public like bank notes as well as guineas; and yet, while ministers asserted this, they passed a law to protect the Bank against the demands of that public. They passed a law to compel that public to take the paper, which it was pretended was as popular as gold.

The statement of the Bank clearly ascertained their solvency in paper: but with regard to their power, or the prospect of power, of renewing their payments in money, it was far from satisfactory. According to the state of their finances, they stood thus on the 25th of February:

Amount of bank notes in circulation,	8,640,250 <i>l</i> .
Bills and notes discounted,—cash and } bullion,—petty cash in the house, }	4,181,400
Difference,	4,458,850 <i>l</i> .

In this statement, the comparative amount of the discounted bills, and of the coin and bullion, were not given. This was not satisfactory to the public; for the main point on which the public alarm had been grounded, was the inability of the Bank as to real, not nominal money.* A table was indeed drawn up by a Mr Allardyce, from which the coin and bullion of the Bank, at their stoppage, was said to be 1,272,000*l*. This was said to be ascertained, from a statement of proportionate increase or diminution of the cash and bullion in the Bank for distinct periods in several years. But the direct sum of their cash and bullion was not given in by the bankers. Allowing, however, that this sum did exist in cash and bullion at the period of stoppage, it gave but a scanty prospect of their speedy resumption of solid payments.

Mr Pitt was charged with having drained the money from the Bank, and sent it abroad in subsidies. He replied, that the whole of the transactions of the Bank, or nearly so, were transactions in paper. This answer certainly repelled the direct censure, that he had drained the Bank of gold; but it still did not disprove, that the advances of the Bank to government, the consequences of an expensive war, had occasioned an issue of paper too much disproportioned to the solid money of the country; that the whole system of our finances was a paper system, and that it had been stretched to a dangerous length.

of outstanding demands on the Bank, on the 25th of February last, (to which day the accounts could be completely made up,) was 13,770,390*l*.; and that the total amount of the funds for discharging those demands, (not including the permanent debt due from government of 11,686,800*l*., which bears the interest of 3 per cent.) was, on the same 25th day of February last, 17,597,280*l*.; and that the result is, that there was, on the 25th day of February last, a surplus of effects belonging to the Bank, beyond the amount of their debts, amounting to the sum of 3,826,890*l*., exclusive of the above-mentioned permanent debt of 11,686,800*l*., due from government. And your committee farther represent, that, since the 25th of February last, considerable issues have been made by the Bank in bank notes, both upon government securities, and in discounting bills, the particulars of which could not immediately be made up; but as those issues appear to your committee to have been made upon corresponding securities, taken with the usual care and attention, the actual balance in favour of the Bank did not appear to your committee to have been thereby diminished.—The second report, Tuesday, 7th March, thus concludes: That, in their opinion, it is necessary to provide for the confirmation and continuance, for a time to be limited, of the measures taken in pursuance of the orders of council on the 26th of February last, submitting to the wisdom of parliament to determine for what limited time it may be necessary that those measures should be continued.

* The nation, that is, the part of the nation who had bank notes, were the creditors of the Bank; they were now compelled to take paper currency in discharge of a debt. Let us hear what Mr Burke says,—“As soon as a nation compels a creditor to take paper currency in discharge of his debt, thence is a bankruptcy.”

In estimating the finances of the year, Mr Pitt stated, that the loan which he should require would amount to eighteen millions, besides five millions and a half of exchequer bills, and thirteen millions and a half of navy bills, which he proposed to fund. Three millions were raised for the assistance of our allies. A levy of 15,000 seamen was ordered to be raised upon the different parishes; a supplementary militia, to the number of 60,000, and a force of 20,000 irregular volunteer cavalry, was expected to be raised by an act, which obliged the owners of pleasure horses to furnish a certain proportion of horsemen for the militia. The general fear had hardly been quieted upon the subject of public credit, when it was awakened by a still more alarming danger. This was a mutiny on board the channel fleet, which broke out in the month of April.

The fleet being entirely in possession of the seamen, delegates met from all the ships in Lord Howe's cabin. Two petitions were presented, in respectful but firm language,—one to the House of Commons, the other to the Board of Admiralty,—demanding a small increase of pay, and of the Greenwich pensions, and a redress of some grievances; in all very reasonable demands. These were readily granted by government, and order was restored without a drop of blood being shed. A revolt of a more licentious nature broke out soon after in the fleet at the Nore, where the seamen, on the refusal of their demands, seized some vessels laden with provisions, and, mooring their ships across the Thames, threatened to cut off all communication between the mouth of the river and the metropolis. Government, to guard against the worst extremes to which the mutineers threatened to proceed, ordered all the buoys to be removed from the mouth of the Thames, whilst furnaces, and red-hot shot, were kept in readiness at Sheerness, and at Tilbury, in case of the forts being attacked. The firmness of government in persisting to refuse their demands, finally prevailed over these improvident and misguided insurgents, who at length struck the red flag of mutiny; and, after struggles on board several of the ships, the ringleaders (of whom the chief was Richard Parker) were seized by the loyal part of the crews, and put to death after a solemn trial.

But the gallantry and success of our seamen formed, during this year, a brilliant contrast to their temporary dereliction of duty. On the 14th of February, Admiral Jervis, while cruising off Cape St Vincent, on the coast of Portugal, with fifteen sail of the line, received intelligence of the approach of a powerful Spanish fleet, which was found to consist of twenty-seven ships of the line. Unintimidated by superior numbers, the British admiral bore down upon the enemy with a press of sail, and, after passing with electric celerity through their line before it was yet formed, tacked about, and separated one-third

of them from the main body. After a furious engagement of four hours, he captured two ships of 112 guns each, one of 84, and one of 74. Only 300 of the victors were lost in this memorable battle; while the loss of the Spaniards, in killed, wounded, and prisoners, could not be less than 6000. The honour of a peerage was deservedly bestowed on Sir J. Jervis, and the title of St Vincent commemorated the scene of his glory.

In the course of the summer, an unsuccessful attempt was made upon the island of Teneriffe, by a body of men that were landed from the squadron of Nelson, who had eminently distinguished himself in the late action. After an ineffectual attempt to storm the fort of Santa Cruz, the assailants were suffered to retire to their ships, rather from the respect than the fear which the Spaniards felt for their rash valour. But the affair cost nearly as many lives as the splendid victory of St Vincent, besides the lives of some brave officers, and the arm of Nelson.

The Dutch fleet, which had long been blocked up in the Texel by Admiral Duncan, ventured out in the month of October, when the British had retired for the purpose of refitting. But Duncan hastily returned from Yarmouth, and found the Dutch fleet, under De Winter, amounting to fifteen sail of the line, drawn up off the coast, adjacent to the village of Camperdown. By the accustomed manœuvre of breaking the hostile line, he engaged the main body under De Winter alone, and prevented his retreat; while Storey, the Dutch vice-admiral, fled basely, with the greater part of his division, soon after the commencement of the action, and entered the Texel in safety. De Winter, with all his remaining crews, fought with desperation, but at length was compelled to strike, with eight others of his line, and two frigates, to the overwhelming force of the British. The carnage on both sides was great, but on the side of the Dutch it was terrible, five hundred men being killed or wounded on board two of their ships only.

Early in this year, Trinidad was captured by a force under Sir Ralph Abercromby, and a fleet under Admiral Harvey. In the Gulf of Pavia, the Spaniards set fire to a fleet of four ships of the line, to prevent their falling into the hands of the captors, but one of them escaped the conflagration.

After the last disastrous campaign of 1796, the Austrian armies in Italy were reinforced with astonishing promptitude, and the imperial general, Alvingi, had even forced the French to fall back. It was then that Bonaparte assumed the command of the army in Italy, and completely beat the Austrians at Rivoli. Mantua was by the issue of this engagement compelled to capitulate, and the shattered remains of the Austrians retired across the Adige, or retreated to Trent. Bonaparte then advanced against the Papal forces, and carrying his arms to Tolentino, reduced his holiness to sign a humiliating peace at that place, as the price of which he paid 30,000,000 livres, and the most valuable manuscripts, statues, and pictures, in his dominions.

In the northern parts of Italy, the Austrians were again enabled to take the field, in considerable force, under the Archduke Charles. But in the face of their reinforced army, Bonaparte passed the Tagliamento, and gaining a succession of victories, compelled the Archduke to retreat towards the Venetian territory, leaving Palma, Nuova, Udine, and the adjacent territory, to the mercy of the French. The main body of the French soon after entered the Austrian dominions. Friuli, and the

garrison of Gradisca, having surrendered, Trieste, the chief town of Carniola, and the whole province of Istria, bordering on the Adriatic, were added to the republican conquests. The French armies continued to advance to within 120 miles of Vienna, when the Archduke accepted a suspension of arms. The preliminaries of a peace between France and Austria were signed at Leoben in Stiria, in April, and a definitive treaty in the following October. By this treaty, the emperor completely renounced the Netherlands, and acknowledged the Cisalpine republic, erected on the French conquests in Italy. By this event, England was left to combat alone with an enemy which had, by force or intimidation, withdrawn Prussia, Germany, Spain, Holland, and the Italian States, from our alliance. Ministers, either intimidated at the alarming solitude in which we now stood as the opponents of France, or desiring to throw the odium of the war upon our enemies, announced, for the third time, their inclination for peace. An answer was returned by the French Directory, expressing an equal desire for peace, but requiring that the negotiation should be for a definitive treaty. Lord Malmesbury arrived at Lisle, and was there met by three French plenipotentiaries, (Messrs Latourneur, Maret, and Pleville.) By accepting French passports, purporting that he was received for the purpose of negotiating a definitive treaty, the British government certainly had virtually acknowledged that his Lordship was invested with powers for more than a preliminary treaty. After a residence of two months at Lisle, the negotiation was broken off by an order from the Directory for his Lordship to depart. The French complaining that he was not invested with sufficient powers, and the British complaining that the Directory had demanded a restitution of all that we had conquered from them and their allies in the course of the war.

Tired with an unavailing contest against the minister's uniform majorities, the chief speakers of the opposition absented themselves from most of the debates in the session of 1797-8. Mr Fox, however, took his place on some occasions of peculiar importance,—he strongly combated the minister's plan of finance for 1798, which included the imposition of the triple assessed taxes, and he gave his support to the yet unsuccessful efforts of Mr Wilberforce for the abolition of the African slave trade. In resisting the unpopular assessed taxes, the minister was assailed by so many objections, that he was forced to modify them by numerous alleviations, adapted to particular cases. The consequence was, that they fell three millions short of their expected produce; and Mr Pitt, in his second budget for the year, was obliged to supply the deficiency by fresh burthens on the exports and imports of the country. To these, and other resources, was added a scheme of voluntary contributions, of which the eventual product was a million and a half. As the country was now confidently menaced by the French with invasion, the army and navy were powerfully recruited, while volunteer associations, which had already been formed throughout the country, became more numerous and assiduous in their application to duty. These threats of invasion, as far as it related to Britain itself, were rather calculated to rouse the spirit than the fears of a free and armed people; but the state of Ireland materially aggravated our danger. Since the refusal of Roman Catholic emancipation, and the recal of Earl Fitzwilliam from the viceroyalty, the great mass of the society denominated the United Irishmen, had been ini-

fiated in a secret conspiracy against the government, which before had been far from general, but confined to the views and designs of a few of its individuals. By the system of severity which was pursued in attempting to discover the machinations of this society—by the use of torture to elicit confessions of those implicated in it, and by the distinguishing persecution set on foot by the Orange faction, the Catholics were at once driven by their enemies, and deluded by factious demagogues, into rebellion. In 1797, the United Irishmen projected a general rising, which would have taken place if the assistance promised by France through their agent Dr Mac Niven, had arrived. An armament for their support was fitted out in France during the same year, and another in the ports of Holland, but the latter was the only one that ever put to sea; it was to be covered by the fleet of the Texel, which Duncan defeated.

In 1798, when a general rising had been concerted, their intentions were fortunately betrayed to government; fourteen of their delegates, and three members of the Irish Directory, were arrested. A fourth, Lord Edward Fitzgerald, died of the wounds which he received in resisting the officers who seized him. Such discoveries, without preventing the rebellion, made it partial and ineffective. Instead of a general rising, which had been intended, the rebellion broke out by an abortive attempt on the town of Naas (on the 24th of May), where the insurgents were instantly dispersed. At Kilkallen and Rathfarman, the rebels were equally unsuccessful. On the 26th of May, a large division of their force was defeated at Tallaghill, and they were repulsed in two attacks upon the towns of Curlew and Kildare. In the county of Wexford, they were more successful; they carried the town of Inniscorthy, sword in hand, and in the town of Wexford exercised some barbarous retaliations on their antagonists the Orangemen. Here they released from confinement Bagnal Harvey, who was appointed commander in chief of their disorderly army. Flushed by their successes, they advanced upon the town of Ross, and by their resolution and weight of column, cleared the bridge and entered the streets of the town; but numbers having entered the houses and got intoxicated, they were repulsed with immense loss. General Lake was, by that time, advancing with large reinforcements of the regular army, and attacked their main body, consisting of nearly 20,000 men, within a mile of Inniscorthy, upon an eminence called Vinegar-hill. After a severe engagement, the rebels fled with precipitation, sustaining an immense loss, while that of the king's troops was comparatively trifling. Rebellion was thus quelled in the south. In the north, it was subdued with less difficulty, although it was very general throughout the counties of Down and Antrim. The insurgents, under a leader of the name of Munroe, to the number of 7000, were defeated at Ballynahinch, and tranquillity was completely restored.

Attempts, however, were made by the French to reanimate the expiring flame of rebellion. About 900 men, under the command of General Humbert, landed at Killala on the 22d of August. Proceeding rapidly to Castlebar, they were joined in their march by numbers of the peasantry, and repulsed a force more than thrice their number, under General Lake, whom they forced to retreat with the loss of six pieces of cannon, and continued advancing towards Tuam. This small band of Frenchmen, who in the course of 17 days had penetrated a considerable way into the kingdom, held for some

time the undisputed possession of Connaught; but at last, a column of our troops under Colonel Crawford forming the advanced guard of Marquis Cornwallis's army, came up with them as they were retreating to Ballinamuch, and after a short, but sharp contest, forced them to surrender as prisoners. A French squadron of one ship of the line and eight frigates, with troops and ammunition on board, destined for Ireland, was on the 11th of October taken or dispersed by the squadron of Sir John Borlase Warren. Among the prisoners taken on board one of the captured vessels, was Theobald Wolfe Torie, one of the earliest founders of the society of United Irishmen, who being tried and condemned, avoided the ignominy of public execution by a voluntary death.

While troops were assembling on the northern shores of France, which assumed the ridiculous appellation of the army of England, a more serious and secret expedition was fitted out for Egypt, which sailed from Toulon under the command of Bonaparte, on the 30th of May. The army, composing nearly 300 sail, having on board 40,000 of the chosen troops of France, arrived on the 9th of June off Malta; the knights of this far-famed spot, which had once been the bulwark of Christendom, capitulated after a spiritless show of defence, and the French obtained an immense military spoil, with more than a thousand pieces of cannon.

Lord St Vincent, while he continued to watch the Spaniards on the western coast of Europe, detached Admiral Nelson with 13 ships of the line and a 50 gun ship in quest of the French, who, after twice crossing the Mediterranean, learnt that they had been seen on the coast of Egypt. Hither he steered his course, and coming in sight of the Pharos of Alexandria, beheld the fleet of Admiral Breuys, consisting of 13 line of battle ships in the bay of Aboukir, with the ~~headmost~~ ship as close as possible to a shoal to the north west, and the rest of the fleet describing a curve along the line of deep water, flanked by numerous gun boats, and a battery of shells and mortars on an island in their van. On the 1st of August, Nelson having reconnoitered the enemy, determined on a dangerous, yet decisive manœuvre, to which he could only be prompted by that high and heroic ardour which borders on temerity. Having made himself acquainted, by repeated trials, of the depth of water near the shore, the signal was made (and boldly executed,) to turn the head of the French line, by which means the whole of the enemy's van was attacked on both sides before any of the French ships, rendered useless by being at anchor, could move to their assistance. The action commenced a little before sunset, and victory declared in favour of England. The contest, however, was long and tremendous. At midnight, Admiral Breuys' ship, L'Orient, which fought with an energy worthy of her size, (she bore 120 guns,) blew up with an explosion that was heard ten leagues from the scene of action. The cannonading ceased on both sides for about ten minutes, with a pause expressive of that awe which the dreadful spectacle had inspired. After midnight the firing was at intervals suspended, from the excessive fatigue of the combatants. At morning the victory was complete. Of a fleet of 13 sail of the line, the Admiral's ship of 120 guns and a 74 were burnt; two 80, and seven 74's were captured; two ships of the line and two frigates escaped by flight, but were soon after taken; so that the whole armament was either captured or destroyed.

The debarkation of Bonaparte, with his staff and his

vanguard, had been effected exactly a month before the battle of the Nile. After issuing a pompous proclamation, declaring, that he came to deliver Egypt from the yoke of the Mamelukes, the French commander took Alexandria by storm. Rosetta soon after surrendered, after which he proceeded to Grand Cairo. The Mamelukes twice gave him battle, and by the impetuous charges of their cavalry, put the fortitude and discipline of his troops to the hardest trial; but the hollow square of the French infantry was found impenetrable to the fury of their antagonists; and a victory which he gained some miles from the Pyramids, decided the fate of Lower Egypt. Mourad and Ibrahim Bey, the chief leaders of the Mamelukes, fled, the former to Upper Egypt, the latter to Syria. In the summer, an armament under Capt. Popham, with a body of troops commanded by Col. Coote, bombarded Ostend, and landing near the town, did considerable damage to the basons, gates, and sluices of the Bruges canal. But after this petty service had been achieved, the troops were prevented from reëmbarking by the fury of the wind and surf, and surrendered, after a short contest, to a superior force of the enemy.

An expedition to Minorca proved more successful. General Stuart, with only 800 men, debarked from Admiral Duckworth's squadron, and having forced, in rapid succession, the most important posts of the island, with the aid of the frigates, and the co-operation of the seamen and marines, obliged the governor to capitulate for the surrender of the whole island.

About the same time, the British government finding that St Domingo could not be retained without immense sacrifices, determined to abandon it. General Maitland, therefore, entered into a compromise with Toussaint Louverture, (formerly a slave, but now commander in chief of the colony,) by which the British consented to leave the island, on condition of the lives and properties being granted to such white inhabitants as chose to remain. The victory of the Nile produced a sensation over all Europe, which was felt at Rastadt, where negotiations had been vainly conducted for a general system of continental indemnities, after the armed truce of Campo Formio. The attacks which were made by France upon Switzerland, Rome, and Egypt, afforded a just ground of quarrel to Austria, Naples, and the Ottoman Porte; while the accession of Paul, Emperor of Russia, who had lately succeeded his mother Catherine II., gave new hopes to the confederates. Hurried on by an imprudent confidence, the king of Naples first took the field, and advanced against the French at Rome, who retired at his approach; but in the course of a few weeks, his whole army (commanded by the imperial general Mack,) was totally routed and dispersed, his capital taken by storm, and he himself obliged to fly for refuge to Sicily, abandoning his continental dominions.

Before the close of the year, a provincial treaty was signed at St Petersburg, by which the emperor of Russia was to afford a succour of land forces, amounting to 45,000 infantry and cavalry; in consideration of which, his Britannic majesty engaged to furnish the emperor a subsidy of 75,000*l.* sterling per month, from the day on which the Russian troops should have passed the frontier; another subsidy of 37,000*l.* per month for extra charges; and a further sum of 225,000*l.* in three months, to expedite the march of the troops to be employed.

The confidence with which the minister spoke of our

new alliance, when the subject of the Russian subsidy came before parliament, was met by animadversions of a very different nature from the opposite side of the house. However dazzling the rising coalition might appear, it was observed, we had seen a former one of still more imposing promises broken to pieces by the enemy. The very name of subsidy implied selfishness in the powers who were to join us. If the interests of Europe were involved, it became its powers to fight for their own security, and not to become the hirelings of Britain. The supplies voted for 1799, amounted to thirty-nine millions. Ten millions of this sum Mr Pitt proposed to raise by a tax upon income, in lieu of the assessed taxes, which had failed in productiveness. Every person whose income exceeded 60*l.* a year, was to be subject to this tax. Incomes from 60*l.* to 100*l.*, were to be taxed in a trifling proportion. Those above 100*l.* were subjected to considerably more. From those of 200*l.* and upwards, a tenth part was to be levied. If the statement of income given in by any individual should be suspected by the commissioners of this tax to be false, they might examine upon oath. An appeal might lie from the lower to the higher commissioners, but with the latter the decision should be final. The land forces voted for this year, were somewhat larger than for the former year. For the navy, 120,000 men were required.

In proportion as the enemies of the country laboured to separate the ties of connection between Britain and Ireland, the British government was anxious to draw them closer together, by uniting the two countries, not only under the same crown, but the same legislature. So sanguine was the British minister in his hopes of succeeding in this measure, though it was necessarily to be submitted to the Irish parliament, that he did not wait for the result of their deliberations, but submitted the plan to the parliament of both kingdoms in one day. On the day appointed in the House of Commons, for addressing his majesty on this subject, the measure met with considerable resistance. Mr Sheridan said, that he conceived it incumbent on ministers, before they proposed the discussion of the plan of the union, to offer some explanations with regard to the failure of the last solemn agreement between the two countries, which had been declared in 1782. The people of Ireland had, at that memorable period, declared their parliament independent. The British legislature acquiesced. What should the Irish now augur from our declared intention of innovation? Not tranquillity, but disquietude; not the suppression of treason, but its aggravation. To agitate any important question on Irish affairs, above all, to decide on so momentous a subject, would be to insult the rights and dignity of their parliament. Whatever were the merits of the plan, or how pure soever the intentions of its projectors, it would aid the purposes of the enemy, by the very passions which its agitation would excite. The concurrence of the Irish, (he added,) could not be hoped for but by stratagem, bribery, or coercion. To the period of the last final adjustment, the cruelty of Britain towards Ireland had been notorious. Would a country which had been insulted for three centuries, when at last she had wrung her independence from our tardy justice at the end of 16 years, forget all her fears, and prejudices, and give up her independence?—Would this be offered, if the free sense of the country were to be taken? Was the parliament of England competent to decide for the par-

liament of Ireland? Impossible. Every advantage of situation favoured the one; the other was unfitted for governing or giving laws, by disadvantage of situation, and by dissimilar habits and temper. The Irish legislature itself, Mr Sheridan contended, was incompetent to sacrifice itself, and transfer its power to the British parliament. Mr Pitt, in answering the opponents of the union, argued, that if the incompetency of the Irish parliament to decree the union were admitted, it would invalidate all the acts of the British legislature since the union of England and Scotland. The gentlemen in opposition, he observed, had for many years loudly complained of the mismanagement of Irish affairs, had expatiated on the deformity of its constitution, and lamented the miseries of its inhabitants. Would it not then be more prudent to apply a promising remedy at the present time, than to risk the effects of a long delay, by which the evils of the country might be aggravated and embittered? Those evils had a deep root, being involved in the prevailing character, manners, and habits of the people—in their want of knowledge—in the unequal state of property—in the separation of classes of the community—and in the rancour of religious differences. Catholic emancipation, and parliamentary reform, had been recommended as remedies; but if the state of society were such, that laws, however wise in themselves, would be ineffectual until the minds of the people were changed, what was the remedy? A legislature standing aloof from party connections, sufficiently removed from the influence of contending factions, to be influenced by neither, and so placed as to have no superstitious reverence for the names and prejudices of ancient families, which had so long enjoyed a monopoly of power and property; a monopoly which custom had sanctioned, and which recent necessity might justify. A legislature was wanted, which should neither give way to the haughty pretensions of a few, nor to the popular clamours of the many. All this was wanted for Ireland. Where was it to be found? In a country where the evils enumerated still exist; or in this country. Where should that legislature deliberate?

No sooner was the proposal of the union unequivocally known in Ireland, than the leading political characters of that country took the ranks in the controversy: the Earl of Clare at the head of the unionists; Mr Forster at the head of the anti-unionists. Some of the latter party were dismissed from their official situations, for refusing their support to the British government on so important an occasion. The members of the Irish bar, by a large majority, published their resolution against the union. The city of Dublin distinguished itself in opposing it; almost all the incorporate bodies of the citizens followed the example.

The Irish parliament opened their debates on the grand question of the union, at the same time that it was submitted to the British legislature. In the first debate, the address to his majesty in favour of the measure was carried by a majority of only one vote. In the next debate, the anti-unionists gave an actual defeat to the ministry, by a majority of six votes. The popular exultation rose to the greatest height on this occasion, and the members of parliament who favoured the union, were generally insulted by the populace. But the determined character of the British minister, was not to be checked by the opposition of Ireland. After a final

debate upon the subject in the English House of Commons, on the 26th of April, a conference was held with the Lords, and the sentiments of both houses were communicated to the throne in due form; but it was reserved for another session to obtain the assent of the parliament of the sister kingdom.

After the treaty of Campo Formio, negotiations had been conducted at Rastadt, for extending the peace, which had been signed only between the French and the king of Hungary and Bohemia, to the whole German empire; but for some time these negotiations had been but a shadow. The capture of Ehrenbreitstein, by the French, put an end to a treaty insincere on both sides. After which, prince Charles, at the head of the Imperialists, gave three successive defeats to the French under Jourdan,* and drove the republicans once more beyond the Rhine. The renewal of the war in Italy, was signalized by the accession of a Russian army, commanded by the far famed Suwarrow. This officer, being joined by an Austrian army, defeated General Moreau, near the Adda, and entered Milan in triumph. Several other important victories were gained by the allies, by which they recovered Turin, Alessandria, and Mantua. These events having encouraged the Neapolitans, they reduced fort St Elmo, with the assistance of the British seamen under Commodore Trowbridge, and effected a most sanguinary and vindictive counter-revolution in their capital. The people of Tuscany acted the same part, and Rome surrendered to the summons of the British commodore.

Suwarrow, after his victories in Italy, for which he was honoured with the title of Prince Italinsky, turned his arms into Switzerland; but there he was arrested by the prevailing fortune of the French, or rather by the misconduct of his Austrian allies, who precipitately retiring from the Rhine, left the Russians in danger of being enclosed between two armies, and necessitated their retreat.

The temporary success of the allies was, however, so important, that it was deemed expedient to make an attempt to rescue the people of the United Provinces from the subjugation of the French. For this purpose, an army of 36,000 men was prepared, of which 17,000 were contributed by the Emperor Paul, on a stipulation of ample pecuniary compensation from the British government. The Prince of Orange (whose son, the hereditary Prince, received a command in the expedition) drew up an address, to be distributed among his people, exhorting them to return to their allegiance, and to give their aid to the Anglo-Russian army, which was sent to support his cause. About the end of August, a landing was made by the British army, and after an engagement with a body of the French and Dutch, they took possession of the Helder fort, with the magazine and shipping. Admiral Mitchell, who commanded the fleet in this expedition, entered the Texel unopposed, and captured the whole Dutch fleet, amounting to 12 ships, eight of which were of the line, their crews refusing to fight against the cause of the Prince of Orange.

On the 10th of September, General Abercromby, waiting on the defensive till an expected reinforcement should arrive from England, was attacked by the Gallo-Batavian army in three large divisions. They were repulsed, however, at every point. Within a few days of this well fought action, his Royal Highness the Duke

* These victories were obtained at Pfullendorph, at Stockach, and at Villengen.

of York arrived, to take the chief command of the army; but though he was accompanied with a reinforcement from England, and a Russian army, the aspect of affairs grew immediately unfavourable. On the 19th of September, the allies proceeded to act on the offensive: they attacked the French and Batavian troops under General Brune, near the town of Bergen; but though they brought off a number of prisoners, and some pieces of artillery, they were obliged to retire to their former position, with a large loss of men. To be stopt in such circumstances, was, in fact, to be defeated. Two other sanguinary actions took place, on the 2d and 6th of October, in which the Anglo-Russian army kept the field during both days, but experienced such resistance as effectually ruined their cause. The difficulties in obtaining provisions, also, daily increased, and the army of the enemy was obtaining fresh reinforcements. Overcome by these obstacles, the Duke of York entered into a convention with General Brune, the French commander, by which the invading army were suffered to retire, on condition of eight thousand seamen, French and Batavian, at present prisoners in England, being restored to their respective countries.

Bonaparte, after having reconquered Italy, had no sooner possessed himself of Egypt, than he turned his arms against the Holy Land, and invading Syria, commenced the siege of Acre. At the head of a chosen band, exceeding twelve thousand, and with a staff of great military skill and experience, he arrived at that place, which was poorly fortified, and defended only by a small garrison of Mussulmans. A gallant British officer, however, (Sir Sidney Smith,) who had been left on the coast, with a small flotilla, inspired the governor and the garrison to make a vigorous resistance, and assisted him so effectually with a body of seamen and marines, that Bonaparte was baffled in eleven attempts to carry it by assault. The conqueror of Italy, after experiencing, for the first time in his life, a defeat, was obliged to retire, having lost eight of his generals, eighty-five of his officers, and one half of his army. Retreating to Cairo, he proceeded from thence to Aboukir, to encounter a large body of the Turks who had effected a landing there, under the command of Mustapha Pacha. He consoled himself for his late disgrace, by a signal victory over 18,000 of these undisciplined barbarians. Soon after this event, the affairs of Europe recalled him to France, to take that high share in the events of his country, which has so materially affected the face of Europe.

The British power was, in the mean time, preserved in India by the overthrow of its inveterate enemy Tippoo Saib. Since the event of the last war, which deprived that prince of half his dominions, he had secretly meditated revenge, and cultivated the friendship of the French republic, with the same assiduity with which he had formerly sought that of the monarchy. Already he had received a small force from the Mauritius, and was busily preparing for a new attack upon the English; the Earl of Mornington, governor of Bengal, sent General Harris with an army of 18,000 men, including 6,000 natives, who took several forts on the frontiers of Mysore. A pitched battle was soon after fought, in which Tippoo was entirely defeated, and General Harris commenced the siege of Seringapatam, the capital of his dominions. The trenches being opened, the cannonading having lasted for three days, orders were given for carrying the place by storm; about noon, on the 4th of May, at an

hour when, according to custom, the Asiatic troops were resigned to repose. General Baird commanded the troops, who ascended the breaches in the fosse, and in the rampart of the fort. The capital was taken, and the sultan himself, who had shared the dangers of his troops, was found, after the engagement, among a heap of the slain. The greater part of his dominions was seized by the British East India company; a small part being allotted to our ally the Nizam of the Decan.

In the opposite quarter of the globe, the British arms were also successful. The flourishing settlement of Surinam was this year wrested from the Dutch, by a body of troops collected from St Lucia and Martinique, and embarked on board a squadron commanded by Lord Hugh Seymour.

In the month of October 1799, all Europe was astonished by the appearance of Bonaparte in Paris, after having returned from Egypt, like a spirit from another world. His return was quickly followed by his usurpation of the supreme power in France, under the title of First Consul; and the first use he made of his sovereignty, was to convey a direct offer of peace to this country, in a letter written with his own hand to the king of Great Britain. His Britannic majesty refusing to depart from the accustomed forms of diplomacy, replied, through his secretary for foreign affairs, to the proposition, that he would seize the first favourable opportunity for a peace, but that at present there appeared to be none. The conduct of ministers in advising the king to this unfavourable answer, met with the severest censures of the opposition at the opening of the session of 1800. The emperor Paul, already tired of a war in which he had reaped neither benefit nor glory, had recalled Suwarrow with the remnant of his army, which had been driven out of Switzerland from the scene of action; and among the subsidiaries of Britain for the year 1800, he was no longer named. Negotiations were, however, concluded, by which the troops of the empire of Germany, and of the elector of Bavaria, were taken into pay.

The Irish parliament having assembled on the 15th of January, the subject of the union was again brought forward; and it was found, that the strength of the anti-unionists was diminished in the Irish commons to 96 voices. On the 5th of February, the whole plan of the union was detailed by Lord Castlereagh, the principal Irish secretary of state, who, after displaying the general principles of the measure, proposed eight articles as the foundation of the union. The 1st article imported, that from the first of January 1801, the kingdoms of Great Britain and Ireland should be for ever united under one kingdom. The 2d, That the succession to the imperial crown should continue limited and settled, according to the act of union between England and Scotland. The 3d, that the united kingdom should have one parliament. The 4th, That four lords spiritual of Ireland, by rotation of sessions, and 28 lords temporal, should be the number of Irish peers who should sit in the united parliament. The 5th, That the churches of England and Ireland should be united into one Protestant Episcopal church, the doctrines and discipline to remain for ever the same. The 6th article provided for a fair participation in commercial privileges; for which end it was however thought necessary to impose certain countervailing duties. The 7th article left to each kingdom the separate discharge of its public debt already incurred; and ordained, that for 20 years from the time of the union, the national expense should be defrayed

in the proportion of 15 parts out of 17 for Great Britain, and 2 for Ireland. The 8th article provided, that the laws and courts of both kingdoms, civil and ecclesiastical, should remain as they were now established, but subject to future alterations of the united parliament. These articles were voted by the peers and commons of Ireland, and on the 2d of April were submitted to the British legislature. In the British as in the Irish parliament, they again encountered the warmest opposition, but finally prevailed. Having been remitted to the latter parliament, they suffered a few immaterial alterations, and, on the 2d of July, were ratified by the royal assent.

The offers of peace which Bonaparte held out to Britain, he extended to her allies; but by them also they were rejected. Flattered by the deluding promises of success in Italy, the Emperor of Germany was induced to continue the war; but Bonaparte resuming, in that quarter, the command in person, victory, as before, waited on his standard; and the fatal battle of Marengo, in Italy, decided the campaign. An armistice was proposed by the defeated Austrians, and granted, on condition of Genoa, Milan, Tortona, Alessandria, Ceva Savone, Urbino, and other important places, being delivered into the hands of the French. Moreau had led another army of France across the Rhine, defeated the Austrians at Blenheim, and penetrated to the Danube, when the extension of the armistice to Germany made him pause in his career of victory.

The English maritime forces, during this year, made a descent on the coast of Bretagne, and destroyed the forts of Quiberon. The Dutch settlements of Goree and Curacoa were also added to our conquests. Two unsuccessful attempts were made upon the Spanish coast. The first by a force under General Pulteney, which debarked from a squadron of Sir J. B. Warren, at Ferrol, but which retired, after a slight skirmish with the enemy, the place being found to be too strong for assault. A still larger armament, under Lord Keith and General Abercromby, appeared before Cadiz; but the plague, which raged in the garrison, and the tempestuous weather on the coast, induced them to retire. They proceeded to the Mediterranean, and happily succeeded in wresting Malta from the hands of the French.

The first continental armistice expired in September, when Austria, unable to renew the combat so soon, dearly purchased the prolongation of the German truce, by surrendering the three fortresses of Ulm, Philippsburg, and Ingolstadt. Hostilities being renewed, at the close of the second armistice, a few partial successes attended the Imperial arms in Franconia; but the contest was speedily and disastrously closed by the battle of Hohenlinden, and by the contemporary victories of General Brune in Italy. At the same time, Macdonald being in possession of the Tyrol, could either turn to strengthen the Italian army, or to join Moreau, who advanced within seventeen leagues of Vienna. Compelled by these disastrous circumstances, the Emperor signed a peace with France, by which he ceded the Belgic provinces, all his territories on the left banks of the Rhine, and all the rights he possessed in Italy over those parts which were now comprehended under the Cisalpine and Ligurian republics.

To increase the gloom of our affairs, the insane and capricious Emperor Paul commenced a dispute with Great Britain, on pretence of her maritime encroach-

ments; and, without warning, laid an embargo on all the British shipping in his ports. This embargo he revoked; but again imposed it, in consequence of a new quarrel respecting Malta, the Russian monarch having assumed the title of Grand Master of the Knights of that island. Sweden and Denmark speedily acceded to a convention against us, in support of what they styled the maritime rights of neutral nations.

Such was the state of public affairs at the close of 1800; a period also memorable for the severest scarcity that had been experienced in the country since the famine at the close of the 17th century; while the ports of the Elbe, the Weser, and of the Baltic were shut against our commerce, and prohibited from relieving us with grain.

Amidst these discouraging circumstances, parliament assembled on the 22d of January, 1801. The great recent events, the union with Ireland, and the hostile convention of the northern courts, furnished matter sufficiently interesting for the royal address, and for the debates of both houses. In the House of Commons, Mr Grey still continued to declare his unfavourable opinion of the boasted measure of the union. With regard to the northern confederation against us, though he could not acquit the Emperor of Russia of violent and unjustifiable conduct, he begged to draw a distinction between the case of that potentate and of the other powers in dispute with us. He expressed his doubts of the justice, as well as the importance of our claims on the neutrals, and of our high pretensions to the right of search. Such claims had been wisely suspended in the year 1780, when the country was in a much less dangerous situation than at present, without any evil consequences having resulted. Mr Pitt, in reply, defended the practice of searching neutrals, which it might now be incumbent upon us to vindicate by force of arms, on the plea of right, as well as of expediency. The principle on which we were now acting, had been universally admitted, and acted upon as the law of nations, except in cases where it had been restrained and modified by treaties between particular states. Those very exceptions were proofs what the law of nations would be, if absolute and unrestrained by such particular treaties. And with regard to the particular treaties between ourselves and the present hostile confederates, they inculcated the right of search in strict and precise terms. On the ground of expediency, he asked, whether, by desisting from search, we ought to allow the navy of our ancient enemy to be supplied and recruited, blockaded ports to be relieved, the treasures of America to be brought in neutrals from South America to Spain, and the stores of the Baltic to Brest or Toulon.

This was one of the last questions which Mr Pitt had to debate in his ministerial capacity. The executive council of the kingdom was now on the eve of dissolution: the minister and his colleagues, Lord Grenville, Lord Spencer, Mr Windham, and Mr Dundas, having determined to resign. Their avowed reason was, their inability to accomplish the full emancipation of the Irish Catholics. So much had been already granted to that body of men, that Mr Pitt had deemed it unsafe to make further concessions, until the union should be effected. When that measure had been accomplished, every obstacle in the way of emancipation seemed to be removed, but the scruples of his majesty had been opposed to their wishes. Such was the cause of their resignation, held out by ministers to the nation and the parliament;

but the strongest doubts were suggested by many, whether the obvious necessity for attempting to make peace with France, and their conscious inability to conclude favourable terms, had not been weightier motives than the business of the Catholics. A new administration was speedily formed, in which Mr Addington was first lord of the treasury and chancellor of the exchequer; Lord Hawkesbury and Lord Pelham were secretaries of state; and the Earl St Vincent first lord of the admiralty. From the number of Mr Pitt's friends, who were left in the subordinate offices of the new administration, and from Mr Pitt's language in parliament, it was suspected that he held unavowedly an influence in their councils. Before his resignation, the house had voted the supplies of the year, which he estimated at forty-two millions.

At the commencement of the year an embargo was laid on all Russian, Danish, and Swedish vessels in the ports of Great Britain; but the court of Berlin, although a party to the league, was, for particular reasons, treated with deference and respect. It was resolved to strike with promptitude, since the combined fleets of the north, had they acted by simultaneous movements, could have collected nearly 80 sail of the line,—a power, which was made more formidable by the narrowness of their seas, and the dangers of their coasts.

On the 11th of March, a British fleet of 18 line of battle ships, with a great number of inferior vessels, sailed from Yarmouth, under the command of Admiral Parker, assisted by Vice-admiral Nelson and Rear-admiral Totty. The commanders were instructed to direct their efforts against the capital of the Danish dominions, if our new plenipotentiary Mr Vansittart should fail in detaching Denmark from the hostile alliance. On the 30th of March the British fleet passed the Sound, and anchored five or six miles from the island of Huen. During the passage of the straits, a remote, but ineffectual cannonade was exchanged with the fortress of Cronenberg.

Lord Nelson having offered his services for conducting the attack, was judiciously entrusted by Admiral Parker with an enterprize worthy of his genius and intrepidity. On the 2d of April, having weighed anchor, and made the signal for attack with 12 ships of the line, he advanced to force the approaches to Copenhagen, which were defended by eleven floating batteries, a numerous artillery on the islands of the Crown and Amak, and by a numerous fleet of ships of different sizes, containing six of the line. Owing to the intricate navigation of the narrow scene of action, three of our chief ships, which were intended to silence the batteries of the crown isles, were prevented from taking the station assigned to them, and although they performed considerable service, this circumstance considerably diminished the success of the day.

The action began at five minutes past 10 in the morning. The British van was led by Captain George Murray of the *Edgar*, and his example of intrepidity was quickly followed by every officer and man in the fleet. After an action of four hours, the fire of the whole Danish fleet was silenced, and the majority of their vessels were either burnt, or taken. As soon as the fire had slackened, and Lord Nelson had perceived that the ships and floating batteries were in his power, although the fire from the islands still continued, he sent a letter to the prince royal of Denmark, addressed to the Danes, the brothers of the Englishmen, in these words:—"Lord

Nelson has directions to spare Denmark when no longer resisting; but if the firing is continued on the part of Denmark, Lord Nelson must be obliged to set on fire all the floating batteries he has taken, without having the power of saving the brave men who have defended them." His royal highness immediately sent his adjutant-general on board Lord Nelson's ship to inquire the particular object of sending the flag of truce. The vice-admiral's answer was, "Lord Nelson's object in sending the flag of truce was humanity; he therefore consents that hostilities shall cease, and that the wounded Danes may be taken on shore. Lord Nelson will take his prisoners out of the vessels, and burn or carry off his prizes, as he shall think fit." Hostilities ceased after this correspondence, which led first to an armistice, and afterwards to a compromise between Britain and Denmark; the secession of Denmark from the northern league being the primary condition of the treaty. A few days previous to this engagement, the Danish and Swedish islands in the West Indies had been reduced by a squadron under Admiral Duckworth.

A Swedish fleet left Carlescrona on the 31st of March, but were prevented by contrary winds from joining the Danes. The British admiral arriving before that harbour, required an explicit declaration from the Swedes, with regard to their intentions against Britain. The Swedish admiral Cronstedt, replied in the name of the king, that Sweden would be faithful to her allies, but would listen to equitable proposals from England, if they came through regular plenipotentiaries.

But an event, important to the present peace of Europe, had occurred a few days before the action of Copenhagen, which, if known sooner, might have saved the lives and limbs of many thousands. This was the death of the insane Emperor Paul, who was strangled by a conspiracy of the nobles in his own palace. The accession of Alexander opened the path to immediate conciliation between the northern powers and this country. Britain, by a few salutary concessions, maintained the right of searching neutrals, and commerce returned to its wonted channels. A convention with Russia was signed on the 17th of June, to which Denmark and Sweden acceded, receiving back from us their captured ships and colonies.

The affairs of the French in Egypt had begun to wear a more promising aspect, when the poinard of an assassin deprived the French army of their able and popular commander Kleber. General Menou, his successor, had still nearly 30,000 regular troops, independent of Copts, Greeks, and Arabs, on whose fidelity, however, small reliance could be placed, to defend the new colony, when a plan was adopted by the new coalition, for invading it with three different armies. It was concerted between the powers interested in the recovery of Egypt, that the grand vizier should lead a body of Turks across the desert. An English army, commanded by General Baird, was to be brought from India by the Red Sea, while the main army of the English was to be landed on the opposite shores. This last and most important body collected at Malta in November 1800. The command of them being declined by General Sir Charles Stuart, K. B. devolved on Sir Ralph Abercromby. Embarking from Malta in December, the British remained for some time on the coast of Caramania, and having encountered severe gales, reached the bay of Aboukir on the 2d of March 1801. There they effected a landing upon the 8th, in the face of a numerous opposing body of the

French. On the 13th, they fought another spirited action with the advanced body of the French near Alexandria, whom they drove back to the heights of Nicopolis. In a few days the fort of Aboukir surrendered; while Menou, arriving from Cairo with his whole disposable force, was on the 20th of March concentrated at Alexandria, and prepared for a decisive battle on the following day. The British occupied a position about four miles from Alexandria, having a sandy plain in their front, the sea on their right, and the lake of Aboukir and the canal of Alexandria (at that time dry) on their left. The action began two hours before day light. A feint attack upon the left of the British was succeeded by a furious onset of the French upon their right. After an obstinate conflict, the repulse of two charges left the British masters of the field; the French returning under the protection of their cannon. The deficiency of ammunition prevented an effective pursuit of them; but the fire of some of our vessels in the harbour gave considerable celerity to the retreat of Menou. Above 3000 of the enemy were killed, wounded, or taken. On the side of the British 1200 men, including the justly lamented Abercromby, were the price of the victory. See ABERCROMBY.

The chief command, after the death of Abercromby, devolved on General Hutchinson. The battles of his predecessor had opened the way to the conquest of Egypt, but had not secured it. For some time the operations of the new commander were slow and cautious. Rosetta, however, was taken; and the Turks, who had now joined the English, gained some advantages over the enemy at Ramanich. These successes, and the exemplary behaviour of our troops, encouraged both the Arabs and the Mamelukes to join our army in great numbers. While their progress was marked with victory on the left bank of the Nile, they made advances in the Delta, till, possessing both shores of the river, they traversed the burning desert, and, coming in sight of the pyramids, proceeded to reduce the once famed capital of Egypt. General Belliard surrendered Cairo, on condition of its garrison being allowed to return to France. They carried with them, as a mark of unfeigned regard, the body of General Kleber. The surrender of Alexandria was alone wanting to complete the conquest of Egypt: But here Menou, far from approving the capitulation of Cairo, increased the fortifications, and threatened to bury himself under their ruins rather than yield. He did not yet despair of receiving reinforcements from Admiral Gantheaume, who, after having been two days within thirty leagues of Alexandria, was obliged to bear away, for fear of an interview with the English fleet. The siege was protracted till September, when the conditions which had been granted to Belliard were renewed to the commander in chief. About 23,000 Frenchmen thus returned from an expedition for which 40,000 had embarked. They were accompanied by several hundreds of the natives of both sexes.

In the naval campaign of this year, although no great battle took place between the rival fleets of the two nations, our accustomed superiority was maintained. On the channel station, Admiral Cornwallis menaced or blockaded Brest; in the south, Sir John Borlase Warren intercepted the trade and communication of Toulon; Sir James Saumarez cut off the trade of Cadiz; Dickson and Greaves menaced the Dutch shores; Admirals Keith and Bickerton possessed the Levantine and

Egyptian seas; Duckworth and Scymour protected our West India islands; and Nelson threw back the terrors of invasion on the shores of France.

The Dutch colony of St Eustatia was captured early in the course of the year by Captain Perkins of the Arab, and a detachment of the 3d regiment of foot under Colonel Blunt. Ternate, the most considerable of the Molucca islands, surrendered to the arms of the East India Company.

In the Mediterranean, Sir James Saumarez finding three French ships of the line and a frigate at anchor near Algeiras, embraced the bold resolution of cutting them out. But the batteries on shore opening a tremendous fire, and several ships of his fleet being disabled from succouring those which commenced the attack, he was obliged to desist from the attempt, and to leave the Hannibal, a 74, which had struck on a shoal beneath the Spanish batteries. The news of this disaster occasioned a boundless exultation in France; it was publicly announced in the Parisian theatres, that six British ships of the line, had been beaten by three French ships, and one of the British ships taken. No allusion was made to the Spanish batteries.

With his few remaining ships, Admiral Saumarez did not hesitate to follow a fleet of the enemy from Cadiz, amounting to ten French and Spanish sail of the line. A cluster of these were attacked by two British ships, on the night of the 11th of July, and in a short time it was discovered that two of the Spaniards were on fire. Two thousand four hundred men were on board these vessels, inextricable from destruction by friend or foe. Saumarez continued to pursue the enemy, who dispersed before him, but two French seventy-fours were made prizes. The boldness and dexterity of this exploit, deservedly received the thanks of parliament.

After consolidating his power, and humbling the great nations, the establishment of peace with England could not be unwelcome to Bonaparte, to whom it would necessarily bring popularity; while the protraction of the war eventually exposed him to farther losses of his colonies, and demanded from him an attempt at the hopeless invasion of England, or a tacit acknowledgment that it was beyond his power. It is needless to recapitulate the circumstances which made the prospect of peace acceptable to the administration of Britain, as the most wished for boon which they could confer upon the great bulk of the country.

In the midst of these hostilities, flags of truce were daily passing amidst vessels of war, from both sides of the channel, and couriers passing between London and Paris.

M. Otto, who had been agent for the release of prisoners, still continued in the British capital; and soon after the preliminaries of peace had been ratified between the French and Austrian government, Mr Merry was sent to Paris as an agent of the British ministry. At length the secretary of state for foreign affairs, after a long and mysterious negotiation with M. Otto, suddenly announced the signature of preliminaries of peace with France, Spain, and Holland. The intelligence spread such universal joy, as never was remembered in the country; and when the French plenipotentiaries arrived with the ratification of the terms, their carriage was drawn through the streets by the populace. Amiens was the place assigned for concluding the definitive treaty: thither the Marquis

Cornwallis went as plenipotentiary from Britain, Don John Azara from Spain, Joseph Bonaparte from France, and Roger John Schimmelpenninck from the Dutch republic.

The definitive treaty was signed at Amiens on the 27th of March 1802. Great Britain ceded by this peace all the colonies which she had gained during the war, except the Spanish island of Trinidad, and the Dutch settlements in Ceylon. Egypt was to be restored to the Porte, and the integrity of the Turkish empire was guaranteed. The dominions of our ally, Portugal, were to remain entire; and the French troops were to evacuate the territory of Naples, and of Rome. By an agreement, however, which was admitted in the course of the treaty, the limits of French Guiana were extended, and the dominions of Portugal curtailed, conformably to the treaty of Badajos, which had been concluded between France and Portugal in the preceding year. With respect to Malta, it was stipulated, that no French or English langue or class of knights should be allowed; that one half of the soldiers in the garrison should be natives, and the rest furnished for a time by the king of Naples; that the independence of the island should be guaranteed by France, Great Britain, Austria, Spain, Russia, and Prussia; and that its ports should be free to all nations.

The Prince of Orange was to receive indemnities for his losses; but it appeared that the Batavian republic was not made responsible for this indemnity, nor were the sources from whence it was to come distinctly ascertained.

While the nation at large was too much delighted at the prospect of peace, to criticise the terms with severity, there was a party strong in talents, if not in numbers, who filled the nation and the parliament with invectives at the treaty of Amiens. Such, however, as that peace was, we are probably justified in saying of it with the greatest statesman of the age, that "we shall probably never look upon its like again."

When the united parliament commenced their second session, in the winter of 1802, the nature of their first measures and debates cast a deep shade of uncertainty over the hopes of peace which the nation had fondly cherished. The ministers called for, and obtained, a vote for 50,000 seamen for the ensuing year, and 129,000 land forces. For the magnitude of this peace establishment, they held out only vague and general reasons. Unable to disguise their own fears, they increased those of the public by an indistinct allusion to the danger. But whilst a part of the accustomed opposition in parliament, deprecated the peace establishment, which we have mentioned, as unnecessarily large, there was a party the most zealous promoters of the late war, who sounded a more distinct note of alarm. Lord Grenville in the peers, and Mr Windham in the commons, denounced the peace as the most degrading and dangerous evil that could have befallen the country. They declaimed against the aggressions of Bonaparte, and the tame and imbecile security of ministers. Mr Fox and the majority of his party exhorted to cultivate peace, and, while they deplored the humiliation of the continent, thought that it could not be saved by our interference. The ministry seemed divided, between the views of their divided opponents.

The great aggressions of Bonaparte, both pending and after the treaty of Amiens, on which those alarms were founded, were his dispatching a large fleet and

armament to the West Indies; his assumption of the dominion of the Italian republic, in his own person; the annexation of Parma to his dominions; his treaty with Spain, by which Louisiana was ceded to France; and his occupation of Porto Ferrajo, and the island of Elba in the Mediterranean. His harsh remonstrances against the liberties of the British press, and his insisting on the unfortunate emigrants of France being driven from the hospitality of our shores, were rather indignities than injuries; but the public indignation of Europe was roused to the highest pitch against him, when Switzerland fell under his yoke. On this occasion the British ministry ventured to interpose. They sent Mr Moore to Constantine, with a view to stimulate the exertions of the Swiss, who arrived there on the 31st of October, (1802,) but found not a trace of resistance existing in the country. After the subjugation of Switzerland, they seem to have dropt for a time the intention of quarrelling with the French ruler, and dispatched orders to surrender all our conquests in pursuance of the treaty of Amiens. Of this measure, they soon after repented, and sent out counter orders to retain our conquests. While it was uncertain whether the latter dispatches would arrive in sufficient time to prevent a violent resumption of those ceded places, the discussions respecting the restoration of Malta were continued, and furnished at last the avowed occasion of the war.

It had been stipulated in the treaty of Amiens respecting this island, "that a grand master should be elected in full chapter by the knights of St John of Jerusalem; that a Maltese langue should be established in the room of the French and English, which were to be for ever abolished; that the British troops were to evacuate the island, provided that there were a grand master or commissioners fully empowered to receive the possession, and that a force of 2000 Neapolitan troops, which were to be furnished by his Sicilian majesty, should have arrived in the island as a garrison; that Great Britain, France, Austria, Russia and Spain, should guarantee this arrangement, and the independence of the island; that these powers should be invited to accede to it, and that the Neapolitan troops were to remain till the knights had raised a sufficient force to protect the island." It might well be remarked, that if Britain desired the independence of Malta, this treaty was not the best calculated to preserve it. The property of the knights was known to lie in other countries, and they were not capable of defending their territory. The revenues of the order had been already confiscated in France and Lombardy. Pending the treaty, its property in Spain was also confiscated, and that in Portugal was likely to follow the same fate. Yet did the British minister, in the open view of these circumstances, conclude the treaty.

During the first part of the discussions respecting Malta, it appears that Bonaparte, confiding in the pacific wishes of the British government, was anxious only for the positive stipulation of the treaty, viz. our surrender of Malta; the conditional part, that is, the guarantee of the independence of the island by the powers of Europe, he hoped would have been dispensed with, and that the island would thus be left to his power and influence, as a stepping-stone to Egypt, the great object of his wishes. As his strides to universal dominion in Europe became bolder, and more rapid, he perceived an alarm in the British councils, which he probably feared might occasion a war prematurely for his pur-

poses. He wished, at all events, to throw the appearance of aggression on our court, and, instead of delaying the guarantee of Malta, used his influence so successfully at Petersburg, that the emperor Alexander gave in his projet respecting the island, and agreed to guarantee its independence. The British court, which had so lately pushed all Europe to guarantee this independence, were now solicitous to find pretexts for rejecting the sponsors. Alexander's projet was sent back for alteration; and an objection to the very restoration of the island to the knights, founded on the dislike of the inhabitants to their government, was studiously brought forward, after the treaty had been signed. On the 25th of January 1803, M. Talleyrand informed Lord Whitworth, that the difficulties respecting the emperor Alexander's guarantee of Malta would be speedily removed, and requested to know the intentions of his Britannic majesty respecting the 10th article of the treaty. From the embarrassment of this question, our ambassador was delivered by the conduct of the first consul, who had published the report of his military missionary Sebastiani, a report, which brought to light his design of occupying Egypt and the Ionian islands. Britain declined any promise about Malta, till this offensive report should be explained.
